ORAN SIM CE 5.2 - Content

*16-January-2026*

## **Notices Copyright Notice ©**

Keysight Technologies 2005 - 2026

No part of this document may be reproduced in any form or by any means (including electronic storage and retrieval or translation into a foreign language) without prior agreement and written consent from Keysight Technologies, Inc. as governed by United States and international copyright laws.

## **Warranty**

The material contained in this document is provided "as is," and is subject to being changed, without notice, in future editions. Further, to the maximum extent permitted by applicable law, Keysight disclaims all warranties, either express or implied, with regard to this manual and any information contained herein, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Keysight shall not be liable for errors or for incidental or consequential damages in connection with the furnishing, use, or performance of this document or of any information contained herein. Should Keysight and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

## **Technology Licenses**

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

## **U.S. Government Rights**

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the U.S. government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to U.S. government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at <http://www.keysight.com/find/sweula> or <https://support.ixiacom.com/supportservices/warranty-license-agreements>. The license set forth in the EULA represents the exclusive authority by which the U.S. government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Key-sight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the U.S. government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data. 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

# Release Overview

## Table of Contents

### 1. [What is New](#)

- [641 New Exploits](#)
- [388 New Malware Samples](#)

### 2. [Full Content List](#)

- [3107 Exploits](#)
- [6755 Malware Samples](#)

For a complete listing of all the new features included in this release, please refer to the '[What is New](#)' section. For a complete listing of all the existing content included in this release, please refer to the '[Full Content List](#)' section.

# What is New

## New Exploits (641)

Attack profile that aims to simulate misuse of a particular vulnerability.

Name	References	Description
Strike Apache Struts REST Plugin OGNL Expression Code Execution Vulnerability	CVE: 2016-3087	This strike exploits a code execution vulnerability in Apache Struts. The vulnerability resides in the handleDynamicMethodInvocation() method of the RestActionMapper class when processing OGNL expressions with Direct Method Invocation enabled. A remote attacker can leverage this flaw by sending a crafted HTTP request, allowing arbitrary code execution with the privileges of the server.
Strike Moxa SoftCMS getcaminfo.asp VWID Parameter SQL Injection Vulnerability	CVE: 2016-5792	This strike exploits a SQL injection vulnerability in Moxa SoftCMS. The vulnerability exists due to improper sanitization of user-supplied input in the VWID parameter of the getcaminfo.asp page. A remote attacker could leverage this flaw by sending a specially crafted HTTP request, potentially leading to unauthorized database access, information disclosure, and remote code execution.
Strike Oracle Identity Manager Default Credentials Vulnerability	CVE: 2017-10151	This strike exploits an authentication weakness vulnerability in Oracle Identity Manager. The vulnerability exists due to the presence of default credentials in the WebLogic Server Administration Console and Enterprise Manager interfaces. A remote attacker can leverage this flaw to gain administrator-level privileges on the target system.
Strike HPE Intelligent Management Center FileDownloadServlet Directory Traversal Vulnerability	CVE: 2017-5795	This strike exploits a directory traversal vulnerability in HPE Intelligent Management Center. The vulnerability resides in the FileDownloadServlet due to improper sanitization of the fileName parameter in HTTP GET requests. A remote attacker can leverage this flaw to access and disclose arbitrary file contents from the server.
Strike Advantech WebAccess WADashboard Arbitrary File Overwrite Vulnerability	CVE: 2018-15705	This strike exploits an arbitrary file overwrite vulnerability in Advantech WebAccess SCADA WADashboard. The vulnerability exists due to improper validation of the folderpath parameter in HTTP requests, allowing directory traversal sequences to bypass restrictions. A remote, authenticated attacker can leverage this flaw to write arbitrary files to the server's file system, potentially leading to remote code execution.
Strike Zoho ManageEngine OpManager SQL Injection in Alarms API	CVE: 2018-20338	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the insufficient validation of the "filters" parameter in HTTP requests to the listAlarms API. A remote, authenticated attacker could leverage this flaw by sending crafted HTTP requests containing malicious SQL queries, leading to arbitrary SQL code execution on the application's database.

Name	References	Description
Strike Schneider Electric IIoT Monitor Server downloadCSV.jsp Directory Traversal Vulnerability	CVE: 2018-7835	This strike exploits a directory traversal vulnerability in Schneider Electric IIoT Monitor Server. The vulnerability exists due to improper validation of the file parameter in requests to the downloadCSV.jsp endpoint. A remote, unauthenticated attacker could leverage this flaw to access and disclose the contents of arbitrary files accessible by the SYSTEM user.
Strike Zoho ManageEngine Applications Manager SQL Injection in Popup_SLA.jsp (sid Parameter)	CVE: 2019-11448	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability resides in the improper validation of the "sid" parameter in the Popup_SLA.jsp Java class. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to database manipulation and remote code execution in the context of the application.
Strike HPE Intelligent Management Center Expression Language Injection Vulnerability cve_2019_11943	CVE: 2019-11943	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability resides in the improper validation of the beanName parameter within the SoapConfigBean class. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary code on the target system with SYSTEM-level privileges.
Strike Squid Proxy Digest Authentication Nonce Pointer Disclosure Vulnerability	CVE: 2019-18679	This strike exploits an information disclosure vulnerability in Squid Proxy. The vulnerability resides in the improper construction of the nonce value used in HTTP Digest authentication. A remote attacker could exploit this vulnerability to obtain leaked pointer addresses, potentially bypassing ASLR and facilitating further attacks.
Strike CoDeSys V3 CmpWebServer Heap Buffer Overflow Vulnerability	CVE: 2019-18858	This strike exploits a heap-based buffer overflow vulnerability in the CoDeSys V3 runtime system's web server. The vulnerability arises from improper validation of user-supplied data in the HTTP header "3S-Repl-Content" when processing requests to the /WebVisuV3 endpoint. A remote, unauthenticated attacker can exploit this flaw by sending specially crafted HTTP requests, potentially leading to arbitrary code execution in the context of the server process.
Strike rConfig devices.inc.php SQL Injection Vulnerability	CVE: 2019-19207	This strike exploits an SQL injection vulnerability in the rConfig Network Device Configuration Tool. The vulnerability exists due to improper sanitization of the searchColumn and searchField parameters in the devices.inc.php script. A remote, authenticated attacker can leverage this flaw by sending specially crafted HTTP requests, potentially leading to the execution of arbitrary SQL commands on the database of the target server.
Strike HPE Intelligent Management Center Expression Language Injection Vulnerability	CVE: 2019-5370	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability resides in the IctTableExportToCSVBean class, specifically in the handling of the beanName HTTP request parameter. A remote attacker, after bypassing authentication or using valid credentials, can exploit this flaw by sending a crafted request, leading to arbitrary code execution with SYSTEM-level privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike rConfig compliancepolicies.inc.php Unauthenticated SQL Injection Vulnerability	CVE: 2020-10546	This strike exploits a SQL injection vulnerability in the rConfig Network Device Configuration Tool. The vulnerability exists due to insufficient input validation in the compliancepolicies.inc.php script when processing HTTP request parameters. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or access.
Strike OpenEMR phpGACL edit_group.php SQL Injection Vulnerability	CVE: 2020-13568	This strike exploits a SQL injection vulnerability in the OpenEMR phpGACL edit_group.php script. The vulnerability arises from improper validation of user-supplied input in the "parent_id" parameter during HTTP POST requests. A remote authenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially leading to the disclosure of sensitive information and further system compromise.
Strike Zoho ManageEngine OpManager Directory Traversal Vulnerability cve_2020_13818	CVE: 2020-13818	This strike exploits a directory traversal vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the improper validation of URI paths within the OpmSkipFilter::doFilter() method. A remote, unauthenticated attacker could leverage this flaw by sending specially crafted requests, potentially leading to arbitrary file read and disclosure of sensitive information on the target server.
Strike Cacti color.php SQL Injection Vulnerability	CVE: 2020-14295	This strike exploits a SQL injection vulnerability in Cacti. The vulnerability exists due to improper sanitization of the "filter" parameter in the color.php script. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to remote code execution on the target server.
Strike Zoho ManageEngine Applications Manager SQL Injection in AlertRes_Mtrgrp.jsp	CVE: 2020-15533	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability exists due to insufficient validation of the "sid" parameter in the AlertRes_Mtrgrp.jsp servlet. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to database manipulation and arbitrary code execution with SYSTEM privileges.
Strike Oracle Business Intelligence AMF Insecure Deserialization Vulnerability	CVE: 2020-2950	This strike exploits an insecure deserialization vulnerability in Oracle Business Intelligence. The vulnerability is located in the handling of AMF3 objects marked as externalizable within the BiRemotingServlet component. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute arbitrary code in the security context of the affected server.
Strike Zoho ManageEngine Applications Manager SQL Injection Vulnerability in UriCollector Class	CVE: 2020-35765	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability resides in the improper validation of the `resourceid` parameter within the `doFilter()` method of the `UriCollector` Java class. A remote, authenticated attacker could leverage this flaw by sending a crafted HTTP request, leading to the execution of arbitrary SQL statements and potentially arbitrary code in the context of the SYSTEM user.

Name	References	Description
Strike Rockwell Automation FactoryTalk RNADiagnosticsSrv Insecure Deserialization	CVE: 2020-6967	This strike exploits an insecure deserialization vulnerability in Rockwell Automation FactoryTalk Diagnostics. The vulnerability resides in the RNADiagnosticsSrv.exe component, specifically in the OnStart() method, which improperly handles serialized data. A remote, unauthenticated attacker could exploit this vulnerability by sending a maliciously crafted serialized object, leading to arbitrary code execution under the SYSTEM security context.
Strike Jenkins Generic Webhook Trigger Plugin XXE Vulnerability	CVE: 2021-21669	This strike exploits an XML External Entity (XXE) vulnerability in the Jenkins Generic Webhook Trigger Plugin. The vulnerability resides in the resolveXPath function, which improperly handles XML data in HTTP POST requests. A remote authenticated attacker with specific permissions could exploit this flaw to access and disclose the contents of arbitrary files readable by the Jenkins server.
Strike Advantech R-SeeNet ping.php Command Injection Vulnerability	CVE: 2021-21805	This strike exploits a command injection vulnerability in Advantech R-SeeNet. The vulnerability exists due to insufficient validation of the "hostname" parameter in the ping.php script. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request, leading to arbitrary command execution with the privileges of the web server on the target system.
Strike Oracle E-Business Suite Sales Offline Infinite Loop Denial of Service Vulnerability	CVE: 2021-2190	This strike exploits an infinite loop vulnerability in the Sales Offline component of Oracle E-Business Suite. The vulnerability is located in the improper handling of HTTP POST requests with a Content-Length header value of 0 in the aslAuthincps.jsp file. Exploiting this vulnerability allows a remote, unauthenticated attacker to cause excessive CPU usage, potentially leading to denial of service conditions on the target server.
Strike Oracle E-Business Suite Knowledge Management Stored Cross-Site Scripting Vulnerability	CVE: 2021-2198	This strike exploits a stored cross-site scripting vulnerability in Oracle E-Business Suite Knowledge Management. The vulnerability resides in the improper sanitization of user-supplied input when handling time period definitions in JSP files. An authenticated attacker with administrative privileges could exploit this flaw to execute arbitrary script code in the browsers of users visiting the affected page.
Strike Advantech iView SQL Injection Vulnerability in ZTPConfigTable	CVE: 2021-22654	This strike exploits a SQL injection vulnerability in Advantech iView. The vulnerability exists due to insufficient validation of user-supplied input in the ZTPConfigTable Java class when processing HTTP request parameters. A remote, unauthenticated attacker could leverage this flaw by sending specially crafted requests, potentially leading to the execution of arbitrary SQL commands, unauthorized data access, or further system compromise.
Strike Eaton IPM Arbitrary File Deletion via Directory Traversal	CVE: 2021-23278	This strike exploits an arbitrary file deletion vulnerability in Eaton Intelligent Power Manager. The vulnerability exists due to insufficient input validation in the handling of HTTP parameters in the maps_srv.js and node_upgrade_srv.js scripts. A remote, authenticated attacker could leverage this flaw to delete arbitrary files on the target system, potentially leading to system compromise.

Name	References	Description
Strike Eaton Intelligent Power Management Arbitrary File Deletion via Directory Traversal	CVE: 2021-23279	This strike exploits an arbitrary file deletion vulnerability in Eaton Intelligent Power Management. The vulnerability resides in the meta_driver_srv.js script due to insufficient input validation of HTTP request parameters. A remote, unauthenticated attacker can exploit this flaw to delete arbitrary files on the target system, potentially leading to system compromise.
Strike Oracle BI Publisher JNDI Injection Vulnerability in SchedulerConfigPage11g	CVE: 2021-2391	This strike exploits a JNDI injection vulnerability in Oracle Business Intelligence Publisher. The vulnerability exists due to insufficient validation of the DB.CFG.JNDIName HTTP request parameter in the SchedulerConfigPage11g class. A remote, authenticated attacker can leverage this flaw by sending a specially crafted request, leading to the execution of arbitrary code on the server through the retrieval of a malicious serialized object.
Strike Oracle Business Intelligence Arbitrary File Upload Vulnerability	CVE: 2021-2392	This strike exploits an arbitrary file upload vulnerability in Oracle Business Intelligence. The vulnerability exists due to insufficient validation of the filename parameter in the UploadFndDBCPPage class. A remote, authenticated attacker could leverage this flaw to upload malicious files, potentially leading to privilege escalation or denial of service.
Strike Oracle BI Publisher JNDI Injection Vulnerability in UpdateConnectionServlet	CVE: 2021-2396	This strike targets a JNDI injection vulnerability in Oracle Business Intelligence Publisher. The issue arises from improper sanitization of the JNDINameField parameter in HTTP requests to the UpdateConnectionServlet. A remote, authenticated attacker could exploit this flaw to trigger a JNDI lookup on an attacker-controlled server, potentially leading to the execution of arbitrary code on the affected system.
Strike Apache OFBiz Insecure Deserialization Vulnerability	CVE: 2021-26295	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. The vulnerability arises from improper handling of serialized objects within SOAP requests. A remote, unauthenticated attacker can exploit this flaw by sending a crafted payload, leading to arbitrary code execution on the affected system.
Strike Zoho ManageEngine AD SelfService Plus Command Injection Vulnerability	CVE: 2021-28958	This strike exploits a command injection vulnerability in Zoho ManageEngine AD SelfService Plus. The vulnerability arises from improper sanitization of user-supplied input during password change requests. A remote attacker could leverage this flaw to execute arbitrary commands on the server with the privileges of the web application.
Strike Apache OFBiz Insecure Deserialization Vulnerability cve_2021_30128	CVE: 2021-30128	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. The vulnerability arises from improper validation of serialized objects within the <cus-obj> XML element in SOAP requests. A remote, unauthenticated attacker could leverage this flaw by sending a crafted payload, leading to arbitrary code execution on the affected system.
Strike Apache Tapestry ContextAssetRequestHandler Information Disclosure Vulnerability	CVE: 2021-30638	This strike exploits an information disclosure vulnerability in Apache Tapestry. The vulnerability resides in the ContextAssetRequestHandler class due to insufficient validation of user input when processing asset requests. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request, potentially leading to unauthorized access and retrieval of sensitive files within the WEB-INF directory.

Name	References	Description
Strike Microsoft Visual Studio Code Remote-Containers Extension Remote Code Execution Vulnerability	CVE: 2021-31213	This strike exploits a remote code execution vulnerability in the Remote - Containers Extension for Microsoft Visual Studio Code. The vulnerability resides in the design flaw of the "Clone Repository in Container Volume" feature, which fails to adequately warn users about the risks of cloning untrusted repositories. A remote attacker could exploit this vulnerability by tricking a user into cloning a malicious repository, leading to the execution of arbitrary code with root-level privileges.
Strike SolarWinds Network Performance Monitor Insecure Deserialization Vulnerability	CVE: 2021-31474	This strike exploits an insecure deserialization vulnerability in SolarWinds Network Performance Monitor. The vulnerability resides in the FromJson() method of the SolarWinds.Serialization.Json.SerializationHelper class within the OrionWeb.dll component. A remote, authenticated attacker can leverage this flaw by sending a crafted serialized object to the vulnerable endpoint, leading to arbitrary code execution under the NETWORK SERVICE user context.
Strike Flarum Core Reflected and Stored Cross-Site Scripting Vulnerability	CVE: 2021-32671	This strike exploits a cross-site scripting vulnerability in the Flarum Core application. The vulnerability resides in the translation library, specifically in the preprocessParameters() method of Translators, which fails to properly sanitize HTML markup. Exploiting this vulnerability allows a remote attacker to execute arbitrary script code in the security context of the browser of any user interacting with the affected pages.
Strike Advantech iView runProViewUpgrade Command Injection Vulnerability	CVE: 2021-32930	This strike exploits a command injection vulnerability in Advantech iView. The vulnerability exists due to insufficient input validation in the `fwfilename` parameter of the `runProViewUpgrade` method within the `NetworkServlet` class. A remote, unauthenticated attacker could leverage this flaw by sending a specially crafted HTTP request, leading to the execution of arbitrary commands with SYSTEM-level privileges.
Strike SolarWinds Orion Platform RenderControl.aspx Insecure Deserialization Vulnerability	CVE: 2021-35215	This strike exploits an insecure deserialization vulnerability in the SolarWinds Orion Platform. The vulnerability resides in the RenderControl.aspx endpoint, where user-supplied JSON data is insufficiently validated. A remote, authenticated attacker can leverage this flaw to execute arbitrary code on the target system with NETWORK SERVICE privileges.
Strike SolarWinds Orion Patch Manager Insecure Deserialization Vulnerability	CVE: 2021-35216	This strike exploits an insecure deserialization vulnerability in the SolarWinds Orion Patch Manager Web Console. The vulnerability resides in the handling of the ThwackData parameter within the EditTopXX.aspx endpoint. A remote, authenticated attacker could leverage this flaw by sending a crafted serialized object, leading to remote code execution under the NETWORK SERVICE security context.
Strike OpenSSL SM2 Decryption Buffer Overflow Vulnerability	CVE: 2021-3711	This strike exploits a buffer overflow vulnerability in the OpenSSL library. The vulnerability arises from an incorrect calculation of the plaintext size during SM2 decryption in the sm2_plaintext_size function. A remote attacker can exploit this flaw by sending specially crafted SM2 encrypted data, potentially leading to denial of service conditions.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Centreon csv_HostGroupLogs.php SQL Injection Vulnerability	CVE: 2021-37556	This strike exploits an SQL injection vulnerability in the Centreon Web Application. The vulnerability exists due to insufficient input validation of the "start" and "end" parameters in the csv_HostGroupLogs.php script. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or further exploitation.
Strike Centreon generateImage.php SQL Injection Vulnerability	CVE: 2021-37557	This strike exploits an SQL injection vulnerability in the Centreon web application. The vulnerability is located in the generateImage.php script, specifically in the handling of the index parameter within HTTP requests. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or further compromise of the system.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability	CVE: 2021-37918	This strike exploits an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The vulnerability resides in the ModifyPhotoAction class, specifically in the cachePhotosBeforeImport() method, which fails to properly validate the file type of uploaded files. A remote authenticated attacker can leverage this flaw by uploading a malicious file, potentially leading to arbitrary code execution with SYSTEM-level privileges.
Strike Delta Industrial Automation DIAEnergie SQL Injection Vulnerability in HandlerAlarmGroup.aspx	CVE: 2021-38393	This strike exploits an SQL injection vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability is located in the HandlerAlarmGroup.ashx endpoint due to insufficient input validation of the agid parameter. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to code execution with NT SERVICE\MSSQLSERVER privileges.
Strike Zoho ManageEngine OpManager SQL Injection in getDataCollectionFailureReason Method	CVE: 2021-40493	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the getDataCollectionFailureReason method, which fails to properly validate HTTP request parameters such as pollingObject and deviceName. A remote, authenticated attacker could leverage this flaw by sending crafted HTTP requests, leading to the execution of arbitrary SQL commands on the application's database.
Strike Zoho ManageEngine Network Configuration Manager SQL Injection Vulnerability	CVE: 2021-41081	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Network Configuration Manager. The vulnerability is located in the CONFIG_SEARCH_CRITERIA parameter of the configuration search operation, where input is improperly validated. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary SQL commands, potentially compromising the underlying database.
Strike Delta Industrial Automation DIAEnergie Stored Cross-Site Scripting Vulnerability cve_2021_44544	CVE: 2021-44544	This strike exploits a stored cross-site scripting vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability exists due to insufficient input validation in the HandlerEnergyType.ashx endpoint when processing the "name," "kid," and "descr" parameters. A remote attacker can exploit this flaw to execute arbitrary JavaScript code in the context of the victim's browser, potentially leading to unauthorized actions or data exposure.

Name	References	Description
Strike Tiny File Manager Directory Traversal and Arbitrary File Write Vulnerability	CVE: 2021-45010	This strike exploits a directory traversal vulnerability in Tiny File Manager. The vulnerability arises from insufficient validation of the "fullpath" parameter during file upload operations. A remote, authenticated attacker can leverage this flaw to perform directory traversal and arbitrary file write, potentially leading to remote code execution under the web server's security context.
Strike Apache Kylin dumpProjectDiagnosisInfo Command Injection Vulnerability	CVE: 2021-45456	This strike exploits a command injection vulnerability in Apache Kylin. The vulnerability resides in the dumpProjectDiagnosisInfo method due to improper validation of user-supplied project names. A remote authenticated attacker could leverage this flaw by crafting a malicious project name and sending it to the vulnerable REST API endpoint, leading to arbitrary command execution in the context of the server process.
Strike WordPress TI WooCommerce Wishlist Plugin item_id Blind SQL Injection Vulnerability	CVE: 2022-0412	This strike exploits a blind SQL injection vulnerability in the TI WooCommerce Wishlist Plugin for WordPress. The vulnerability exists due to improper sanitization of the user-supplied `item_id` parameter in the `get_wishlist_by_product_id()` function. Exploiting this vulnerability allows a remote, unauthenticated attacker to retrieve arbitrary information from the target database.
Strike Dolibarr ERP-CRM Menu Editor Code Injection Vulnerability	CVE: 2022-0819	This strike exploits a code injection vulnerability in the Dolibarr ERP/CRM software. The vulnerability exists due to insufficient input validation in the "Menu editor" module, specifically in the handling of the "perms" and "enabled" parameters. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary PHP code, potentially leading to remote code execution on the target server.
Strike WordPress Photo Gallery Plugin SQL Injection via filter_tag Parameter	CVE: 2022-1281	This strike targets a SQL injection vulnerability in the Photo Gallery plugin for WordPress. The issue arises from improper sanitization of the "filter_tag" parameter in HTTP requests. Exploiting this flaw allows a remote, unauthenticated attacker to execute arbitrary SQL commands, potentially leading to unauthorized access to sensitive database information.
Strike Pimcore GridHelperService SQL Injection Vulnerability	CVE: 2022-1429	This strike exploits a SQL injection vulnerability in Pimcore. The vulnerability exists due to improper input validation in the /grid-proxy, /get-export-jobs, and /get-batch-jobs APIs. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, potentially leading to unauthorized database access and manipulation.
Strike WordPress Events Made Easy Plugin lang Parameter SQL Injection Vulnerability	CVE: 2022-1905	This strike exploits a SQL injection vulnerability in the Events Made Easy plugin for WordPress. The vulnerability exists due to insufficient sanitization of the "lang" parameter in HTTP requests. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to unauthorized access to sensitive data in the database.

Name	References	Description
Strike Lansweeper AssetActions SQL Injection Vulnerability	CVE: 2022-21210	This strike exploits an SQL injection vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of user-supplied input in the "Mass Edit Assets" functionality. A remote, authenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially gaining unauthorized access to or manipulating the underlying database.
Strike Lansweeper GetAssetsByGroupId SQL Injection Vulnerability	CVE: 2022-21234	This strike exploits an SQL injection vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of user-supplied input in the "order" parameter of the GetAssetsByGroupId function. A remote, authenticated attacker could leverage this flaw by sending a crafted HTTP request, potentially leading to remote code execution under the security context of the database service.
Strike Advantech iView SQL Injection in findTaskMgrItems Parameters	CVE: 2022-2135	This strike targets a SQL injection vulnerability in Advantech iView. The issue arises from insufficient input validation for the "sort_field" and "sort_type" parameters in the "findTaskMgrItems" process. Exploiting this flaw allows a remote, unauthenticated attacker to execute arbitrary SQL commands on the affected server.
Strike Advantech iView SQL Injection in set_useraccount UserName Parameter	CVE: 2022-2136	This strike targets a SQL injection vulnerability in Advantech iView. The issue arises from insufficient input validation of the UserName parameter in the set_useraccount process. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary SQL commands, potentially leading to remote code execution with SYSTEM-level privileges.
Strike Lansweeper HelpdeskSetupActions SQL Injection Vulnerability	CVE: 2022-22149	This strike exploits an SQL injection vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of user-supplied input in the EditSetting() method of the HelpdeskSetupActions component. A remote, authenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially leading to remote code execution under the database service.
Strike H2 Database Console Remote Code Execution via Malformed JDBC URL	CVE: 2022-23221	This strike exploits a remote code execution vulnerability in the H2 Database Console. The vulnerability arises from improper input validation when processing specific JDBC URLs. A remote, unauthenticated attacker can exploit this flaw by sending a crafted request, potentially leading to arbitrary code execution with the privileges of the H2 process.
Strike Parse Server DatabaseController Prototype Pollution Vulnerability	CVE: 2022-24760	This strike exploits a prototype pollution vulnerability in Parse Server. The vulnerability exists due to improper input validation in the DatabaseController when handling JSON data in HTTP POST and PUT requests. A remote, unauthenticated attacker could exploit this vulnerability to inject or modify properties in Object.prototype, potentially leading to denial of service or remote code execution.
Strike WordPress WP Statistics Plugin Stored Cross-Site Scripting Vulnerability	CVE: 2022-25305	This strike exploits a stored cross-site scripting vulnerability in the WordPress WP Statistics plugin. The vulnerability exists due to insufficient input validation of the "ip," "browser," and "platform" parameters in the class-wp-statistics-visitor.php file. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute arbitrary JavaScript code in the context of a user's browser.

Name	References	Description
Strike Studio-42 elFinder Directory Traversal Vulnerability	CVE: 2022-26960	This strike exploits a directory traversal vulnerability in Studio-42 elFinder. The vulnerability exists due to insufficient validation of user-supplied paths in the target and targets parameters. A remote, unauthenticated attacker can leverage this flaw to access files outside the intended web root, potentially leading to arbitrary code execution under the web server's security context.
Strike WWBN AVideo Command Injection via downloadURL Parameter	CVE: 2022-32572	This strike exploits a command injection vulnerability in WWBN AVideo. The vulnerability exists due to insufficient sanitization of the `downloadURL` parameter in HTTP requests. A remote, authenticated attacker could leverage this flaw to execute arbitrary commands on the server, potentially leading to remote code execution.
Strike Advantech iView ConfigurationServlet SQL Injection Vulnerability	CVE: 2022-3323	This strike exploits a SQL injection vulnerability in Advantech iView. The vulnerability is located in the ConfigurationServlet, specifically in the improper validation of the column_value parameter. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute crafted SQL queries, potentially leading to information disclosure.
Strike Trend Micro Mobile Security web_service.dll Path Traversal Vulnerability	CVE: 2023-32521	This strike exploits a path traversal vulnerability in Trend Micro Mobile Security. The vulnerability exists due to improper validation of user-supplied file paths in the web_service.dll component. A remote, unauthenticated attacker could leverage this flaw to delete arbitrary files on the system under the security context of the IIS Anonymous Authentication account.
Strike Splunk Enterprise Arbitrary File Write via XSLT Stylesheets	CVE: 2023-46214	This strike targets an arbitrary file write vulnerability in Splunk Enterprise. The issue resides in the insufficient validation of XSLT stylesheets within the getJobAsset method of the search.py script. Exploiting this vulnerability allows a remote, authenticated attacker to create or overwrite arbitrary files, potentially leading to arbitrary code execution under the context of the Splunk process.
Strike WordPress Royal Elementor Addons Plugin Unrestricted File Upload Vulnerability	CVE: 2023-5360	This strike exploits an unrestricted file upload vulnerability in the WordPress Royal Elementor Addons and Templates plugin. The vulnerability arises from insufficient validation of user-supplied input during file upload processing. A remote attacker can leverage this flaw to upload malicious files, potentially leading to remote code execution within the context of the PHP interpreter.
Strike WordPress Ultimate Member Plugin SQL Injection via Sorting Parameter	CVE: 2024-1071	This strike exploits a time-based blind SQL injection vulnerability in the WordPress Ultimate Member plugin. The vulnerability exists due to improper input validation of the "sorting" parameter in the ajax_get_members() function. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially leading to unauthorized access to sensitive database information.
Strike ConnectWise ScreenConnect InstallExtension Directory Traversal Vulnerability	CVE: 2024-1708	This strike exploits a directory traversal vulnerability in ConnectWise ScreenConnect. The vulnerability exists due to improper validation of file paths within ZIP archives during the extension installation process. A remote attacker could leverage this flaw to execute arbitrary code on the target server by crafting malicious ZIP files.

Name	References	Description
Strike Centreon Web Virtual Metrics SQL Injection Vulnerability	CVE: 2024-55573	This strike exploits an SQL injection vulnerability in Centreon Web. The vulnerability resides in the manageVMetric method of the centreonGraph.class.php script, specifically in the handling of the rpn_function parameter. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to arbitrary SQL command execution on the target database.
Strike Centreon Web updateServiceHost SQL Injection Vulnerability	CVE: 2024-5723	This strike exploits an SQL injection vulnerability in Centreon Web. The vulnerability exists due to insufficient input validation in the updateServiceHost function within the DB-Func.php script. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to the execution of arbitrary SQL commands on the target database.
Strike Reprise License Manager HTTP licfile Buffer Overflow		This strike exploits a buffer overflow vulnerability in Reprise License Manager. The vulnerability is due to improper validation of HTTP request licfile parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike Domino Web Server Database Access - agentrunner.nsf		This strike attempts to access the /agentrunner.nsf database on a misconfigured Lotus Domino web server.
Strike Apache File Access .htgroup		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .htpasswd		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access httpd.conf		This strike attempts to access an Apache configuration file over HTTP.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 1	BID: 4294 CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 2	BID: 4294 CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 11	BID: 4294 CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 12	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Apache Stronghold Server Information Disclosure		This strike attempts to access the Apache Stronghold stronghold-info page.
Strike Apache Stronghold Server Status Disclosure		This strike attempts to access the Apache Stronghold stronghold-status page.
Strike Sensitive File Access .svn-entries		This strike attempts to access a Subversion entries file in the web root.
Strike Apache System User Directory Access bin		This strike attempts to access a system user's web directory over HTTP.
Strike Apache System User Directory Access cron		This strike attempts to access a system user's web directory over HTTP.
Strike Apache System User Directory Access root		This strike attempts to access a system user's web directory over HTTP.
Strike Sensitive File Access ws_ftp.log		This strike attempts to access a WS_FTP transfer log file.
Strike Sensitive File Access WS_FTP.LOG		This strike attempts to access a WS_FTP transfer log file.
Strike Apache File Access .www_acl		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .wwwacl		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .wwwgroup		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .wwwpasswd		This strike attempts to access an Apache configuration file over HTTP.
Strike Actionpoll index.php include Parameter PHP File Include	CVE: 2001-1296  BID: 3383	This strike exploits a PHP include flaw in the Actionpoll PHP voting application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Actionpoll index.php include_dir Parameter PHP File Include	CVE: 2001-1296  BID: 3383	This strike exploits a PHP include flaw in the Actionpoll PHP voting application.
Strike ActivePerl perlIS.dll Filename Overflow Variant 1	CVE: 2001-0815  BID: 3526	This strike exploits a buffer overflow in perlIS.dll in ActivePerl for Microsoft IIS when parsing requests containing a long filename ending in '.pl'.
Strike AdMentor Admin Remote SQL Injection	CVE: 2007-0575  BID: 22281	This strike exploits a remote SQL injection vulnerability in the AdMentor admin page
Strike Adobe Acrobat getAnnots Remote Code Execution (HTTP)	BID: 34736  CWE: 399  CVE: 2009-1492	This strike exploits a code execution vulnerability in Adobe Acrobat Reader.
Strike Adobe Flash plugin Transparent Object Clickjacking Vulnerability	CWE: 264  CVE: 2013-2866	This strike exploits a vulnerability in the Adobe flash plugin for the Google Chrome Browser on Macintosh OSX. The Flash vulnerability exists in the latest version of Chrome and allows for the victim's webcam's audio/video to be hijacked when handling CSS opacity settings that make the window transparent. Normal use of this plugin would prompt the user to allow or deny use to the requesting ip, but in this case it executes without a prompt.
Strike AOL 9.5 ActiveX SoapURL Buffer Overflow		This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the SoapURL function.
Strike Apache APR_PSPrintf Memory Corruption Vulnerability	CVE: 2003-0245  BID: 7723	This strike exploits a buffer overflow flaw in the Apache HTTP server.
Strike Apache apr- util IPv6 URI Parsing Buffer Overflow 1	CVE: 2004-0786	This strike exploits a vulnerability in the way Apache 2.0.35 - 2.0.50 parses IPv6 URI addresses. An attacker can request a malformed literal address which causes a buffer overflow and could potentially lead to code execution.
Strike Apache apr- util IPv6 URI Parsing Buffer Overflow 2	CVE: 2004-0786	This strike exploits a vulnerability in the way Apache 2.0.35 - 2.0.50 parses IPv6 URI addresses. An attacker can request a malformed literal address which causes a buffer overflow and could potentially lead to code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apache Chunked Encoding Overflow - Apache Nosejob	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the nosejob.c proof-of-concept exploit.
Strike Apache Chunked Encoding Overflow - Apache Nosejob (Evade)	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the nosejob.c proof-of-concept exploit.
Strike Apache Chunked Encoding Overflow - Apache Scalp	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the scalp.c proof-of-concept exploit.
Strike Apache Chunked Encoding Overflow - Apache Scalp (Evade)	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the scalp.c proof-of-concept exploit.
Strike Apache Struts2 code execution	CWE: 732  CVE: 2011-3923  BID: 51628	The strike exploits a malicious code execution vulnerability present in apache strust2. The attacker can execute command by sending crafted HTTP request.
Strike Apple Safari Javascript Multibyte Character Escaping DoS		This strike triggers a denial of service in the Apple Safari web browser when handling Javascript that escapes multibyte character strings.
Strike Apple Safari for Windows Beta feed --URL DoS Variant 1	BID: 24460	This strike exploits a denial of service flaw in Apple Safari for Windows Beta. This flaw is triggered when the browser attempts to open feed:// urls with special characters.
Strike AssetMan download_pdf.php pdf_file Parameter Directory Traversal	BID: 22921  CVE: 2007-1427	This strike exploits a directory traversal vulnerability in AssetMan
Strike Beautifier Core.php BEAUT_PATH Parameter PHP File Include	CVE: 2006-4044  BID: 19873	This strike exploits a PHP include flaw in the Beautifier web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer Frameset Null Pointer Dereference		This strike exploits a Denial of Service in Microsoft Internet Explorer. The vulnerability is triggered when a specific HTML element attribute is set to an unallowed value. By enticing a user to view a malicious web page, an attacker can cause the vulnerable browser to crash. NOTE: The vendor does not intend to issue a patch for this vulnerability.
Strike CA BrightStor ARCserve Backup r11.5 ActiveX AddColumn Buffer Overflow	CWE: 119 CVE: 2008-1472 BID: 28268	This strike exploits flaw in an ActiveX control that ships with CA Brightstor ARCserve Backup r11.5 that can be triggered by sending an overly long string as the first argument to the AddColumn method resulting in a buffer overflow and potentially leading to arbitrary code execution.
Strike Centreon Web Interface UserAlias Command Execution	EXPLOITDB : 40170	This strike exploits a vulnerability in Centreon Web Interface. The vulnerability is due to how Centreon utilizes the echo command for logging SQL errors. It is possible for an unauthenticated attacker to abuse this functionality to inject and execute commands remotely at the login screen.
Strike CHETCPASSWD System Shadow File Disclosure	CVE: 2002-2219 BID: 6472	This strike exploits a flaw in CHETCPASSWD that discloses the tail end of the system shadow file
Strike Clipbucket Arbitrary PHP Code Execution		This strike exploits a file upload vulnerability in Clipbucket web application. The vulnerability is due to improper validation of the user controlled input to the file uploading scripts. By exploiting this vulnerability, a remote, unauthenticated attacker can upload any file including PHP scripts and execute them on the target server. NOTE: When run in one-arm mode, target web application index needs to be available at http://[server].
Strike Clipbucket - Operating System Command Injection		This strike exploits a command injection vulnerability in Clipbucket web application. The vulnerability is due to improper input validation of the "file_name" parameter in HTTP requests to "file_uploader.php" script. By exploiting this vulnerability, a remote, unauthenticated attacker can execute arbitrary OS commands on the target server. NOTE: When run in one-arm mode, file_uploader.php script needs to be available at http://[server]/api/file_uploader.php. Test will create a file named "exploited" in the same location as the vulnerable script.
Strike CSLiveSupport csLiveSupport.cgi setup Parameter Code Execution	CVE: 2002-1751 BID: 4450	This strike exploits an arbitrary code execution flaw in the csLiveSupport website client support application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer mergeAttribues Property Handling Memory Corruption	CVE: 2007-0945 BID: 23769	Microsoft Internet Explorer contains a memory corruption vulnerability. The mergeAttribues method will copy the attributes, events, and styles from one DOM object to another without validating the type of object passed in. If attributes exist in the source object which do not exist in the destination object, those attributes may write in out-of-bounds memory, resulting in memory corruption. Successful exploitation may result in arbitrary code execution with user privileges or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer cloneNode Dereferenced Pointer Memory Corruption	CWE: 399 CVE: 2007-3903 BID: 26816	Microsoft Internet Explorer contains a memory corruption vulnerability. If an element object is created with no variable referencing it, the memory will be freed during garbage collection. If cloneNode is then called on that object, which contains a pointer to the now freed memory, memory corruption could occur. Successful exploitation could lead to execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Symantec appstream launchobj ActiveX code execution	CWE: 20 CVE: 2008-4388 BID: 33247	This strike exploits a Symantec appstream client launchobj ActiveX control code execution vulnerability which is due to no confirmation when executing the command in the ActiveX control. Remote attackers may do arbitrary file creation on the target system.
Strike HP Openview Network Node Manager ovalaunch HTTP Request Buffer Overflow	CWE: 119 CVE: 2008-4562 BID: 33668	This strike exploits a buffer overflow vulnerability in HP OpenView Network Node Manager (NMM). The vulnerability is due to insufficient validation of user-supplied data. By sending a specially crafted HTTP request an unauthenticated attacker could potentially execute arbitrary code on the target server.
Strike Free Download Manager torrent File String Buffer Overflow	CWE: 119 CVE: 2009-0184 BID: 33555 EXPLOITDB : 16634	This strike exploits a stack buffer overflow vulnerability in Free Download Manager. Multiple vulnerabilities can be triggered by use of overly long string values. By enticing a user to open a malicious file with the affected software, an attacker could execute arbitrary code.
Strike Oracle Secure Backup Administration Authentication Bypass < >	CVE: 2009-1977 BID: 35672	This strike exploits a authentication bypass inside Oracle's secure backup administration application. The vulnerability resides in the php script that handles authentication and is present due to an input validation error
Strike Oracle Secure Backup Administration Property Box Command Injection	CVE: 2009-1978 BID: 35678	This strike exploits a command injection vulnerability inside Oracle's Secure Backup Adminstration web interface. The vulnerability allows command injection by passing malicious URL encoded parameters to property_box.php script

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP OpenView NNM ovwebsnmpsrv Buffer Overflow	CWE: 119 CVE: 2009-4181 BID: 37343	This strike identifies a vulnerability in the ovwebsnmpsrv.exe service of HP OpenView's Network Node Manager. A buffer overflow exists when parsing the sel value of the request. The number of times this value is copied to a stack buffer of 400 bytes is determined by the OvwSelections parameter in the arg value.
Strike Novell eDirectory dhost stack buffer overflow	CWE: 119 CVE: 2009-4653 BID: 37009 BID: 36815	This strike exploits a Novell eDirectory dhost stack buffer overflow vulnerability which is due to bad input check the length of module name in HTTP request. Remote attackers may do arbitrary code execution on the target system.
Strike Novell eDirectory dhost httpstpk password buffer overflow	CWE: 119 CVE: 2009-4654 BID: 37042	This strike exploits a Novell eDirectory dhost httpstpk passwords buffer overflow vulnerability which is due to bad input check the length of sadminpwd and verifypwd. Remote attackers may do arbitrary code execution on the target system.
Strike Symantec IM Manager groupList Parameter SQL Injection	CWE: 89 CVE: 2010-0112 BID: 44299	This strike exploits a SQL injection vulnerability in the groupList parameter in the Symantec IM manager. This vulnerability is due to improper sanitization of an HTTP parameter. A remote attacker could exploit vulnerability to execute arbitrary SQL commands on the target system.
Strike Internet Explorer mergeAttributes Method Memory Corruption	CWE: 94 CVE: 2010-0247 BID: 37893	This strike exploits a vulnerability in Microsoft Internet Explorer. The mergeAttributes method is not properly validated, and when an object uses it with the object as the oSource parameter, the attributes are deleted. The object is then called, and because the attributes have been modified, memory corruption will occur.
Strike Viscom Software Movie Player Pro ActiveX Control Buffer Overflow	CWE: 119 CVE: 2010-0356	This strike exploits a buffer overflow in Viscom's Movie Player Pro ActiveX control MOVIEPLAYER.MoviePlayerCtrl.1. The strFontName parameter is not properly validated, and if an overly long string is received it will overflow the buffer.
Strike Novell Teaming File Upload Directory Traversal	CVE: 2010-2773 BID: 41795	This strike exploits a vulnerability in Novell's Teaming where a user may use a directory traversal exploit to clobber arbitrary files.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Sharepoint Malformed Request Code Execution Vulnerability	CVE: 2010-3964 BID: 45264	This strike exploits a code execution vulnerability in Microsoft Sharepoint Document Coversion Launcher service. The vulnerability is due to insufficient validation of SOAP requests sent to the service interface. By specially crafting a malicious SOAP request, an unauthenticated attacker could execute arbitrary commands on the server.
Strike Symantec IM Manager SQL Injection Vulnerability	CWE: 89 CVE: 2011-0553 BID: 49738	This strike exploits a SQL injection vulnerability in Symantec IM Manager. The vulnerability is due to a failure to properly validate parameters in HTTP requests to IMAdminLDAPConfig.asp. A remote attacker could exploit this vulnerability by enticing an authenticated user to view a malicious web page, resulting in execution of arbitrary SQL code against the IM Manager database.
Strike Cisco Unified Communications Manager Multiple SQL Injections	CWE: 89 CVE: 2011-1610	This strike exploits an SQL injection vulnerability in Cisco Unified Communications Manager. The vulnerability arises due to the lack of proper sanitation of user supplied arguments to xmldirectorylist.jsp, xmldirectorylist.utf-8.jsp, and xmldirectorylist.other.jsp. An unauthenticated remote attacker can access the vulnerable web service and inject an SQL query into a parameter, thus allowing an attacker to inject and execute arbitrary SQL commands, which can result in disclosure of sensitive information.
Strike Microsoft ASP .NET Forms Authentication Elevation of Privilege	CWE: 264 CVE: 2011-3416 BID: 51201	The Forms Authentication feature in the ASP.NET subsystem in Microsoft .NET Framework 1.1 SP1, 2.0 SP2, 3.5 SP1, 3.5.1, and 4.0 allows remote authenticated users to obtain access to arbitrary user accounts via a crafted username, aka "ASP.Net Forms Authentication Bypass Vulnerability."
Strike HP Managed printing Administration jobAcct Remote Command Execution	CWE: 22 CVE: 2011-4166 BID: 51174	This strike exploits a vulnerability in HP Managed Printing Administration web interface. A flaw in the MPAUploader.uploader.1 control, specifically in the UploadFiles functioncould allow a remote unauthenticated attacker to upload a file under the wwwroot directory. Version 2.6.3 and before are vulnerable.
Strike Microsoft Internet Explorer VML Use After Free CVE 2012-0155	CWE: 94 CVE: 2012-0155 BID: 51935	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when removing objects described in the Vector Markup Language (VML).
Strike IBM Tivoli Provisioning Manager SQL Injection	CWE: 89 CVE: 2012-0199	This strike exploits an SQL Injection in IBM Tivoli Provisioning Manager where an attacker can update underlying data. In particular, a user may upgrade their account to an administrator.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle GlassFish XSS	BID: 53136 CVE: 2012-0551	This strike exploits a cross site scripting flaw in the Oracle GlassFish. The remote attacker could use this vulnerability to do code execution attack in the target system.
Strike HP SiteScope Multiple Directory Traversal Vulnerabilities	CVE: 2012-3264 BID: 55273	This strike exploits a directory traversal vulnerability in HP SiteScope. The vulnerability is due to insufficient validation of user-supplied input by Upload/Download manager servlets while processing http requests. A remote attacker could exploit the vulnerability to download, or upload and execute, arbitrary files to/from the target server via relative or full directory paths.
Strike Avaya's IP Office Customer Call Reporter Unrestricted File Upload	CVE: 2012-3811 BID: 54225	This strike exploits a flaw in Avaya's IP Office Customer Call Reporter where an unauthenticated user can upload an arbitrary file.
Strike WordPress Plugin Quick Post Widget 1.9.1 Cross-site scripting	CWE: 79 CVE: 2012-4226 BID: 54311	WordPress Quick Post Widget plugin contains multiple cross-site scripting vulnerabilities.
Strike Symantec Messaging Gateway Information Disclosure	CWE: 22 CVE: 2012-4347 BID: 56789	This strike exploits one of two directory traversal vulnerabilities exist in Symantec Messaging Gateway. The vulnerabilities are cause by improper validation of user-supplied input, specifically HTTP parameters. A remote attacker could exploit these vulnerabilities to download arbitrary system files.
Strike HP Intelligent Management Center Arbitrary File Upload	CVE: 2012-5201 BID: 58385	This strike exploits a flaw in HP's Intelligent Management Center where a user can upload a zip file which in turn clobbers arbitrary files.
Strike Adobe Flash Player Memory Corruption	CWE: 119 CVE: 2012-5271	This strike exploits a flaw in Adobe's Flash Player where a malformed action script can write variables which are not allocated and leads to memory corruption.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Movable Type 4.2x, 4.3x Upgrade Script RCE	CWE: 287  CVE: 2013-0209  CVE: 2012-6315	This strike exploits Movable Type 4.2x, 4.3x upgrade script to gain remote code execution on target server.
Strike SonicWall Multiple Products setSessionCheck Authentication Bypass	CVE: 2013-1359  BID: 57445	This strike exploits a vulnerability that is present in multiple SonicWall products and that allows remote unauthenticated access. The vulnerability is located at the level of the applianceMainPage
Strike PHP php_quot_print_encode parameter parsing heap buffer overflow	CWE: 119  CVE: 2013-2110  BID: 60411	This strike exploits a buffer overflow vulnerability in PHP. When parsing percent encoded parameters, specially crafted strings can cause a heap buffer overflow. Successful exploitation may allow arbitrary code execution or abnormal termination of application using php, resulting in a denial of service condition.
Strike Apache Struts URL Command Execution	CWE: 94  CVE: 2013-2115  BID: 60167	This strike exploits command execution vulnerability in Apache Struts. A specially crafted URL can be sent to enable allowStaticMethodAccess and execute arbitrary Java runtime commands. Successful exploitation can result in execution of arbitrary code.
Strike Apache Struts OGNL action-redirect-redirectAction Command Execution	CWE: 20  CVE: 2013-2251  BID: 61189	This strike exploits command execution vulnerability in Apache Struts. A specially crafted HTTP GET or POST requests can be sent to the Apache Struts server to execute arbitrary code with user privileges.
Strike HP System Management Homepage iprange Stack Buffer Overflow	CWE: 121  CVE: 2013-2362	A stack buffer overflow exists in HP System Management Homepage. The vulnerability is due to insufficient input validation when handling HTTP requests containing an iprange variable to the /proxy/DataValidation URI. A remote unauthenticated attacker could exploit this vulnerability by sending a crafted request to the vulnerable service. Successful exploitation could result in arbitrary code execution in the context of the currently affected service, which is System by default.
Strike Oracle Java Final Field Overwrite Remote Code Execution	CWE: 265  CVE: 2013-2423	This strike exploits a design weakness vulnerability in Oracle Java JRE/JDK. This vulnerability is due to improper validation of user supplied input. A remote attacker could exploit this vulnerability by enticing a user to open a crafted webpage and can result in remote code execution in the context of the user running the browser.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Java java.util.concurrent.ConcurrentHashMap Memory Corruption	CVE: 2013-2426 BID: 59206	This strike exploits a memory corruption vulnerability in Oracle Java. The vulnerability is due to insufficient validation of serialized ConcurrentHashMap objects. Successful exploitation of this vulnerability could result in the execution of arbitrary Java code on the target system.
Strike Squid HTTP Host Header Denial of Service	CWE: 20 CVE: 2013-4123	This strike exploits a vulnerability in Squid Internet Proxy application. If an HTTP request is received, squid parses the host headers looking for a hostname:portnumber. The port number is then used in a conversion, and if this conversion fails the process will terminate.
Strike Symantec Endpoint Protection XXE Injection	CVE: 2013-5014 BID: 65466	This strike exploits an XXE injection vulnerability in Symantec Endpoint Protection management console. This vulnerability is due to improper handling XML external entities in the management console. A remote attacker can take advantage of this vulnerability to do DoS attack on the target system.
Strike WordPress Complete Gallery Manager Plugin Arbitrary File Upload	CVE: 2013-5962	This strike exploits a vulnerability inside the Complete Gallery Manager Plugin for WordPress which allows remote users to upload arbitrary files to the server.
Strike EMC CMCNE FileUploadController Arbitrary File Upload	CWE: 94 CVE: 2013-6810	This strike exploits a EMC Connectrix Manager Converged Network Edition SAN management suite. Due to improper authorization, a remote unauthenticated attacker may upload an arbitrary files through the FileUploadController servlet. All versions of the software prior to 12.0.3 are vulnerable.
Strike Synology DiskStation manager SLICEUPLOAD Remote Command Execution	CWE: 264 CVE: 2013-6955	This strike exploits a vulnerability for Synology Diskstation Manager. Specifically, the exploit targets how user input is processed and appended to files when using the SLICEUPLOAD functionality. The flaw allows an unauthenticated remote attacker to write random command to server side script files and potentially leverage arbitrary command execution. All version belonging to 4.1.x software branch are vulnerable.
Strike Apache HTTP Server mod_status Race Condition Heap Buffer Overflow, verified	CWE: 362 CVE: 2014-0226 BID: 68678	This strike exploits a race condition vulnerability in Apache HTTP Server which leads to a heap buffer overflow. When simultaneously processing requests to server-status and to any other uri, it is possible for a non-null terminated string to be created. The system attempts to copy this until it finds null characters, leading to a heap buffer overflow. Successful exploitation can result in execution of arbitrary code or abnormal termination of the Apache HTTP Server.
Strike Microsoft Internet Explorer Use After Free	BID: 65372 CWE: 119 CVE: 2014-0274	This strike exploits a vulnerability in Microsoft Internet Explorer. If a DOMNodeRemoved event is triggered and all the objects that belong to the current HTMLSelection object are removed inside the event handler for DOMNodeRemoved, a use-after-free condition can occur.

Name	References	Description
Strike Microsoft Internet Explorer Use After Free CVE 2014-0305	CWE: 119 CVE: 2014-0305 BID: 66030	This strike exploits a use after free error triggered when Microsoft Internet Explorer handles DOM rewrites when processing certain web pages. If a user opens a specially crafted web page, on a vulnerable machine, a heap memory corruption is triggered that can lead to arbitrary code execution using local privileges. All versions of Internet Explorer 6 through 11.
Strike Novell GroupWise FileUploadServlet Directory Traversal	CWE: 200 CVE: 2014-0600 BID: 69424	This strike exploits a directory traversal vulnerability in Novell GroupWise. The vulnerability is due to improper validation of user supplied parameters in the fileUpload servlet. An unauthenticated attacker can exploit this vulnerability by sending a specially crafted request to the vulnerable server, leading to the disclosure and destruction of files in arbitrary locations on the server. NOTE: By default the vulnerable services are accessed via SSL connection (port 9710).
Strike WordPress WP Symposium Plugin Arbitrary File Upload	CVE: 2014-10021 BID: 71686	This strike exploits a file upload vulnerability in Wordpress WP Symposium Plugin version 14.11. The vulnerability is due to lack of sanitization of the user-uploaded files in UploadHandler.php. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary code by uploading files on the server and execute them.
Strike PHP Libmagic Executable PE Selection Table Entry Out of Bounds Memory Access	CWE: 119 CVE: 2014-2270	This strike exploits an out of bounds memory access vulnerability in PHP Libmagic. An executable file with a specially crafted PE selection table entry can cause an integer overflow when calculating the memory address. This will bypass verification, allowing for access of an out of bounds memory location. Successful exploitation can result in execution of arbitrary code or abnormal termination of PHP, resulting in a denial of service condition.
Strike Atlassian Jira Issue Collector Directory Traversal	CWE: 22 CVE: 2014-2314 BID: 65849	This strike exploits a vulnerability in the Atlassian JIRA software suite. It allows a remote unauthenticated attacker to upload a file to random location on the file system by exploiting a directory traversal vulnerability. All versions of JIRA prior to 6.0.3 are vulnerable.
Strike Oracle Event Processing FileUploadServlet filename Parameter Directory Traversal	CVE: 2014-2424 BID: 66871	This strike exploits a directory traversal exploit in Oracle Event Processing. When processing multipart messages sent to FileUploadServlet, the filename parameter is not sanitized for directory traversal characters. Successful exploitation can result in creation or overwrite of arbitrary files.
Strike HP Universal CMDB Default Credentials Arbitrary File Upload	CVE: 2014-2617 BID: 68363	This strike exploits a code execution vulnerability in HP Universal CMDB. The vulnerability is due to the use of hard-coded credentials with administrator rights. By exploiting this vulnerability, an attacker can upload files on the server using the hard-coded credentials and execute code with SYSTEM privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer basefont ASLR Bypass	CWE: 264 CVE: 2014-4140 BID: 70325	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. An attacker can entice a target to visit an HTML page with a specially crafted basefont tag to trigger the vulnerability. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike ManageEngine Multiple Products FileAttachment directory traversal	CWE: 22 CVE: 2014-5301	This strike exploits a directory traversal vulnerability in multiple ManageEngine products. The vulnerability is due to improper validation of the path parameter when uploading files to the server. By exploiting this vulnerability, an authenticated attacker can upload files to arbitrary locations on the server and execute them.
Strike ManageEngine Multiple Products multipartRequest Directory Traversal	CWE: 22 CVE: 2014-6036 BID: 70172	This strike exploits a vulnerability inside multiple products from the Manage Engine suite which allows arbitrary file execution. The vulnerability is due to lack of authentication controls and directory traversal vulnerabilities.
Strike ManageEngine EventLog Analyzer agentUpload Directory Traversal	CWE: 22 CVE: 2014-6037 BID: 69482	This strike exploits a code execution vulnerability inside ManageEngine EventLog Analyzer. The vulnerability allows remote unauthenticated attackers to upload files to arbitrary locations and grants execution abilities with System privileges.
Strike Novell Zenworks Configuration Management Rtrlet Directory Traversal	CWE: 22 CVE: 2015-0781 BID: 74291	This strike exploits a directory traversal vulnerability in Novell Zenworks Configuration Management. The vulnerability is due to improper validation of user supplied data in the Rtrlet class when uploading files to the server. By exploiting this vulnerability, an unauthenticated attacker can upload files to arbitrary locations on the server and execute them.
Strike ManageEngine ServiceDesk Plus Privilege Bypass Information Disclosure	CWE: 200 CVE: 2015-1480 BID: 72302	This strike exploits a directory traversal vulnerability in ServiceDesk. A non-administrator user can access certain directories which should be restricted to administrators due to insufficient validation. Successful exploitation can result in disclosure of information.
Strike Oracle Endeca Information Discovery Integrator ETL Server Directory Traversal Vulnerability Through CopyFile	CVE: 2015-2604 BID: 75757	This strike exploits a directory traversal vulnerability in Oracle Endeca Information Discovery Integrator ETL Server. The vulnerability is due to improper validation of parameters when handling CopyFile operation in SOAP requests. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.

Name	References	Description
Strike Oracle Endeca Information Discovery Integrator ETL Server Directory Traversal Vulnerability Through MoveFile	CVE: 2015-2605 BID: 75756	This strike exploits a directory traversal vulnerability in Oracle Endeca Information Discovery Integrator ETL Server. The vulnerability is due to improper validation of parameters when handling MoveFile operation in SOAP requests. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Wordpress Simple Ads Manager Arbitrary File Upload	CVE: 2015-2825 BID: 73924	This strike exploits a directory traversal vulnerability in Wordpress Simple Ads Manager. The vulnerability is due to lack of sanitization of the path parameter in sam-ajax-admin.php. By exploiting this vulnerability, an unauthenticated attacker can upload arbitrary files on the server and execute them.
Strike TP-Link Archer Devices Directory Traversal	CWE: 22 CVE: 2015-3035	This strike exploits a directory traversal vulnerability in TP-Link Archer Devices. This vulnerability is due to insufficient input validation. A remote, unauthenticated attacker could exploit this vulnerability to read sensitive information from arbitrary files located on the file system of the target server.
Strike PHP tar Zero Length File Name Integer Overflow	CWE: 189 CVE: 2015-4021 BID: 74700	This strike exploits an integer overflow vulnerability in PHP. When PHP processes a tar file, it determines the length of the filename by the displacement of the first null byte. A later calculation subtracts 1 from this length. If the calculated length was zero, the calculation results in an unsigned integer overflow, allowing access to a large portion of the heap. Successful exploitation may result in execution of arbitrary code with privileges of the service running PHP or abnormal termination of the service.
Strike Endian Firewall Proxy Reset Pasword Command Execution	CWE: 77 CVE: 2015-5082 EXPLOITDB : 38096 BID: 76865	This strike exploits a input validation error present in Endian Firewall. Vulnerability can be exploited by crafting a special HTTP request to the target. Successful exploitation would result in arbitrary command execution in the security context of Apache httpd server.
Strike ManageEngine Desktop Central fileupload connectionID Directory Traversal Arbitrary File Upload	CWE: 434 CVE: 2015-8249 EXPLOITDB : 38982	This strike exploits an arbitrary file upload vulnerability in ManageEngine Desktop Central. Files can be uploaded to the target by sending an HTTP POST request to /fileupload with a query parameter action=rds_file_upload. The connectionId parameter is not checked for directory traversal characters. An attacker can send a malicious HTTP POST request to upload an arbitrary file to an arbitrary location on the target system. Successful exploitation may lead to creation or overwriting of arbitrary files, which may lead to execution of arbitrary code with system privileges.
Strike Oracle Application Testing Suite UploadFileUpload Directory Traversal	CVE: 2016-0491 BID: 81169	This strike exploits a directory traversal exploit in Oracle Application Testing Suite. HTTP POST requests to /olt/UploadFileUpload.do do not sanitize for directory traversal characters. An authenticated attacker can send a specially crafted HTTP POST request to upload arbitrary files to any location writable by the Oracle Load Testing service. Note, while this attack requires authentication, it can be paired with the authentication bypass attack, CVE-2016-0492.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Ruby Rails Dynamic Render Directory Traversal	CWE: 22 CVE: 2016-0752	This strike exploits a Directory Traversal vulnerability in the web component of Ruby Rails. The vulnerability is due to unrestricted use of the render method. A remote unauthenticated attacker could exploit this vulnerability by sending a crafted request. Successful exploitation could result in unauthorized file access and leakage of sensitive data.
Strike Advantech WebAccess Dashboard Multiple File Upload Vulnerabilities	CVE: 2016-0854 BID: 80745 EXPLOITDB : 39735	This strike exploits a file upload vulnerability in Advantech WebAccess. WebAccess has several URIs designed to accept image files. These files are not verified, and specially crafted HTTP POST requests can be used to upload any arbitrary file. This includes uploading asp and aspx files, which can then be called to achieve arbitrary asp code execution with the privileges of the IIS service. Successful exploitation may result in creation of arbitrary files and could lead to arbitrary code execution.
Strike PHP phar_parse_pharfile filename_len Integer Overflow	BID: 95774 CWE: 190 CVE: 2016-10159	This strike causes a denial of service in PHP due to a integer overflow when parsing a phar file. The flaw is a bounds check for the filename length field embedded in the file. A malicious file can cause a PHP server to crash.
Strike Adobe Flash Out of Bounds When Placing Object	CVE: 2016-1104 BID: 90618 EXPLOITDB : 39825 GOOGLE: 794	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to an out of bounds read when placing a corrupt image. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike NETGEAR Management System NMS300 File Upload Vulnerability	CVE: 2016-1524 BID: 82630	This strike exploits a file upload vulnerability in NETGEAR Management System NMS300. The vulnerability is due to improper unauthenticated access to certain URLs that allow uploading of files and then accessing them. By exploiting this vulnerability an attacker could upload and execute code on the target machine.
Strike Novell Service Desk LiveTime File Upload Directory Traversal	CWE: 22 CVE: 2016-1593	This strike exploits a directory traversal vulnerability in Novell Service Desk. Service Desk allows administrators to upload CSV files, however Service Desk fails to validate the file is actually a CSV and does not sanitize for directory traversal characters. An authenticated user could exploit this in order to upload arbitrary files to arbitrary locations. Additionally, Service Desk contains default administrator credentials, which could be used by an attacker to gain authentication.

Name	References	Description
Strike GD Library libgd gd_gd2 c Heap Buffer Overflow	CWE: 189 CVE: 2016-3074	A heap buffer overflow vulnerability has been reported in libgd. The vulnerability is due to a signedness error that leads to a heap buffer overflow. Libgd is included within PHP. A remote attacker can exploit this flaw having the target process a crafted malicious GD2 file. Successful exploitation could result in code execution in the security context of the user process.
Strike Adobe Flash ATF Processing Heap Overflow	CVE: 2016-4135 GOOGLE: 786	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow in ATF processing. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike Symantec Web Gateway Whitelist white_ip Command Execution	CWE: 78 CVE: 2016-5313 BID: 93284	This strike exploits a command execution vulnerability in Symantec Web Gateway. Authenticated requests to the URI / spywall/new_whitelist.php are used to create whitelists. The parameter white_ip is not validated if the sid parameter is non-zero. The value of white_ip will later be used in a shell command, allowing for arbitrary command execution with administrative privileges. An authenticated attacker could send specially crafted HTTP messages to achieve arbitrary command execution with administrative privileges.
Strike WordPress Admin API Directory Traversal	CWE: 22 CVE: 2016-6896	This strike exploits a directory traversal vulnerability inside WordPress. Specifically this occurs when HTTP requests are sent to the admin-ajax page with the action parameter update-plugin set. Directory traversal characters are not handled properly, and an authenticated user can send multiple requests to this API, which will result in a denial of service condition.
Strike Microsoft Edge Browser Chakra Engine Array.map Type Confusion	CWE: 119 CVE: 2016-7190 BID: 93428	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, a type confusion vulnerability exists in the Microsoft Edge module Chakra.dll. A malicious attacker can craft javascript in such a way that when a proxy object is created and Array.map is called upon that object, memory information can be disclosed. It may also be possible to cause a denial of service condition in the browser or achieve remote code execution by corrupting these memory contents in a specified manner.
Strike Brocade Network Advisor FileReceiveServlet filename Directory Traversal	CWE: 22 CVE: 2016-8204	This strike exploits a directory-traversal vulnerability in Brocade Network Advisor. The vulnerability is due to lack of input-validation on the filename parameter for FileReceiveServlet. A remote attacker could exploit this vulnerability to upload arbitrary files and result in arbitrary code execution with privileges of the SYSTEM.
Strike Brocade Network Advisor DashboardFileReceiveServlet Directory Traversal Vulnerability	CVE: 2016-8205	This strike exploits a directory traversal vulnerability in Brocade Network Advisor. The vulnerability resides in the DashboardFileReceiveServlet servlet due to insufficient input validation of the filename parameter in HTTP multipart form requests. A remote, unauthenticated attacker could exploit this vulnerability to upload malicious files, potentially leading to arbitrary code execution with SYSTEM privileges.

Name	References	Description
Strike Primetek Primefaces Padding Oracle Remote Code Execution	CWE: 326 CVE: 2017-1000486	This strike exploits a command injection vulnerability in the web component of Primetek Primefaces. The vulnerability is due to inadequate encryption strength. A remote attacker could exploit this vulnerability by sending a crafted request using the known password or the default password. Successful exploitation could result in arbitrary command execution under the security context of the root user.
Strike Synology Photo Station Arbitrary File Upload	CWE: 287 CVE: 2017-11151 EXPLOITDB : 42434	This strike exploits an Arbitrary File Upload vulnerability in Synology Photo Station. The vulnerability is due to improper input validation of user controlled input. A remote, unauthenticated attacker can upload arbitrary files to the target server.
Strike Apache Tomcat Misconfigured HTTP PUT Remote Code Execution	CWE: 434 CVE: 2017-12617	This strike exploits a file upload vulnerability in Apache Tomcat. The vulnerability arises from a misconfiguration in handling PUT requests. When Tomcat is configured with readonly set to false and PUT requests are allowed, attackers can upload files with names ending in ".jsp///". Tomcat removes the trailing slashes, saving the file as a ".jsp" that includes attacker-controlled data. A remote, unauthenticated attacker can exploit this vulnerability by sending a PUT request with a malicious payload in the .jsp file, which executes when accessed. Successful exploitation could result in remote code execution within the context of the user running the Apache Tomcat.
Strike Cacti spikekill php Cross-Site Scripting	CWE: 79 CVE: 2017-12927	This strike exploits a reflected cross-site scripting vulnerability in Cacti. This vulnerability is due to improper validation of the method parameter within spikekill.php. The method value should be one of the stddev, float, variance, or fill. A remote attacker could exploit this vulnerability by enticing an authenticated user to visit a maliciously crafted URL in which the value of method is not one of the previously mentioned values. Successful exploitation could lead to arbitrary script code execution in the context of the user's browser.
Strike Apache httpd FilesMatch Policy Bypass	CWE: 20 CVE: 2017-15715 BID: 103525	This strike exploits a policy bypass vulnerability in Apache httpd FilesMatch. FilesMatch is intended to prevent files which do not match certain regex patterns to be uploaded via HTTP PUT messages. One of these patterns is AP_REG_DOLLAR_ENDONLY, which is intended to prevent files ending with the character. However, this option does not work properly, allowing for files ending with to be uploaded. An attacker can send a specially crafted HTTP PUT message to bypass the policy and upload arbitrary files.
Strike Palo Alto Networks Management Interface Authentication Bypass	CVE: 2017-15944 EXPLOITDB : 43342 BID: 102079	This strike exploits a management interface authentication bypass vulnerability in Palo Alto Networks PAN-OS 6.1.18 and earlier, PAN-OS 7.0.18 and earlier, and PAN-OS 7.1.13 and earlier. Note: A remote user can exploit a combination of vulnerabilities in the management interface to execute arbitrary commands on the target system. The code will run with root privileges. This strike simulates panAuthCheck authentication bypass.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike NetGain Systems Enterprise Manager settings.upload filename Directory Traversal	CWE: 668 CVE: 2017-16603 BID: 102307	This strike exploits a vulnerability in NetGain Systems Enterprise Manager prior to v7.2.766. The vulnerability is caused by insufficient validation of user input in http requests. Successful exploitation could result in arbitrary file accessible on target server.
Strike Roundcube Webmail timezone File Disclosure Vulnerability	CWE: 552 CVE: 2017-16651	This strike exploits Local File Inclusion vulnerability in Roundcube webmail. The vulnerability occurs due insufficient input validation in conjunction with the file-based attachment plugins. An authenticated remote attacker with an active session can exploit this vulnerability by sending crafted request to the server. Successful exploitation of this vulnerability leads to information disclosure by accessing arbitrary files
Strike Advantech WebAccess SCADA gmicons.asp Arbitrary File Upload	CWE: 434 CVE: 2017-16736	An arbitrary file overwrite vulnerability has been identified in Advantech WebAccess SCADA web platform. The vulnerability is caused by the lack of proper input sanitisation of the gmicons.asp picfile parameter. The vulnerability can be exploited by sending a specially-crafted request, allowing the attacker to execute code on the remote machine with the privileges of the application process.
Strike Quest NetVault Backup NVBUEventHistory SQL Injection	CWE: 89 CVE: 2017-17412 BID: 102252	An SQL injection vulnerability exists in Quest NetVault Backup appliance. The vulnerability is due to insufficient user-supplied input validation within Server Process Manager Service. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP request.
Strike Quest NetVault Backup NVBUTransferHistory SQL Injection	CWE: 89 CVE: 2017-17419	An SQL injection vulnerability exists in Quest NetVault Backup appliance. The vulnerability is due to insufficient user-supplied input validation within Server Process Manager Service. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP GET request.
Strike Quest NetVault Backup NVBUJobCountHistory SQL Injection	CWE: 89 CVE: 2017-17420 BID: 102252	An SQL injection vulnerability exists in Quest NetVault Backup appliance. The vulnerability is due to insufficient user-supplied input validation within Server Process Manager Service. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP request.
Strike Oracle Fusion Middleware MapViewer Code Execution	CVE: 2017-3230 BID: 97746	This strike exploits a Code Execution vulnerability in the Oracle Fusion Middleware MapViewer component of Oracle Fusion Middleware. Successful attacks of this vulnerability can result in unauthorized creation, deletion or modification access to critical data.

Name	References	Description
Strike Oracle WebLogic Server OS Command Injection Vulnerability	CWE: 78 CVE: 2017-3506	This strike exploits an OS command injection vulnerability in Oracle WebLogic Server. The vulnerability is caused by insecure deserialization of untrusted data. A remote, unauthenticated attacker could exploit this vulnerability by sending a specially crafted serialized object to the vulnerable WebLogic Server. When the server processes this object, it deserializes the data, leading to the execution of the attacker's code.
Strike HPE Intelligent Management Center UrlAccessController Authentication Bypass	CWE: 287 CVE: 2017-5791	This strike exploits an authentication bypass vulnerability in HPE Intelligent Management Center. This vulnerability is due to doFilter method which contains multiple ways to bypass authentication if the URI contains specific strings. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target system. Successful exploitation allows to bypass authentication requirements, which can be leveraged to execute arbitrary code in the context of SYSTEM.
Strike NETGEAR DGN2200 Devices OS Command Injection Vulnerability	CVE: 2017-6334 CWE: 78	This strike exploits an OS command injection vulnerability on NETGEAR DGN2200 routers. The vulnerability is due to improper input validation in user-supplied input , allowing shell metacharacters in the host_name field of an HTTP POST request in dnslookup.cgi script. A remote authenticated attacker can exploit this by sending a crafted POST request with valid login details. Successful exploitation could allow the attacker to execute arbitrary OS commands on the device.
Strike Apache HTTP Server Token Out of Bounds Read	CWE: 20 CVE: 2017-7668 BID: 99137	This strike exploits a denial of service vulnerability in Apache HTTP Server. The vulnerability is due to an out-of-bounds that read exists in Apache when handling HTTP request with a malicious connection header field. By maliciously crafting a sequence of request headers, an attacker may be able to cause a DoS attack.
Strike PHP gdImageCreateFromGifCtx Out Of Bound Read	CWE: 200 CVE: 2017-7890 BID: 99492	This strike exploits a PHP information disclosure vulnerability before version 5.6.31 and 7.x before 7.1.7 . This vulnerability is due to improper handling of objects in memory under GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c file. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted image file to the target server. Successful exploitation results in information disclosure.
Strike Exponent CMS eaasController php api Function SQL Injection	CWE: 89 CVE: 2017-7991	This strike exploits an SQL injection vulnerability in Exponent CMS. The vulnerability is due to a lack of input validation on the apikey HTTP parameter by the api() function. A remote, unauthenticated user can exploit this vulnerability by sending a crafted HTTP request to the affected page. Successful exploitation could result in the execution of arbitrary SQL commands on the target server.

Name	References	Description
Strike HPE Intelligent Management Center flexFileUpload Arbitrary File Upload	CWE: 22 CVE: 2017-8961	This strike exploits an arbitrary file upload vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. By design, the uri /imc/flexFileUpload should accept xml documents in multipart/form-data encoding. However, file extension and type are not validated, allowing for arbitrary file upload. An attacker can send specially crafted HTTP POST requests containing an arbitrary file with multipart/form-data to upload the file. If the file is of type .jsp or .jspx, the attacker can then request the file to achieve arbitrary code execution with SYSTEM privileges.
Strike PHPUnit Command Injection	CWE: 94 CVE: 2017-9841	This strike exploits a command injection vulnerability in PHPUnit. This vulnerability lies within the /phpunit/src/Util/PHP/eval-stdin.php file through its use of the php://input wrapper. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted post request to the target server. Successfully exploiting this vulnerability could result in arbitrary PHP code execution on the target system.
Strike Trend Micro Endpoint Application Control FileDrop Directory Traversal	CWE: 22 CVE: 2018-10357	This strike exploits a directory traversal vulnerability in the management console of Trend Micro Endpoint Application Control. The vulnerability is due to insufficient validation of filenames in the filename parameter of the Content-Disposition header in multipart/form-data requests sent to FileDropService. A remote, authenticated user can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation could result in the execution of arbitrary code as the SYSTEM user.
Strike Quest KACE System Management Appliance Remote Code Execution	CWE: 78 CVE: 2018-11138	This strike exploits a critical command injection vulnerability within the Quest KACE System Management Appliance. The vulnerability arises from the /common/download_agent_installer.php script's inadequate sanitization of user-supplied input. Specifically, arises due to the the script fails to properly neutralize special elements used in operating system commands, allowing an attacker to inject arbitrary commands. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the vulnerable endpoint, potentially leading to remote code execution.
Strike Quest Appliance - NetVault Backup Stack Buffer Overflow	CWE: 20 CVE: 2018-1161	A stack buffer overflow has been identified in Quest NetVault Backup appliance. The vulnerability is caused by the lack of proper input sanitisation in the context of multipart HTTP requests processing. The vulnerability can be exploited by accessing the Web Interface of the NetVault server via a specially-crafted HTTP POST request, allowing the attacker arbitrary code execution with SYSTEM privileges.
Strike Quest Appliance - NetVault Backup Arbitrary File Overwrite	CVE: 2018-1162	An arbitrary file overwrite vulnerability has been identified in Quest NetVault Backup appliance. The vulnerability is caused by the lack of user input sanitisation in the context of log exportation. The vulnerability can be exploited by accessing the Web Interface of the NetVault server via a specially-crafted HTTP POST request, allowing the attacker to overwrite any file with SYSTEM privileges.
Strike Quest NetVault Backup Checksession Authentication Bypass	CVE: 2018-1163	This strike exploits an authentication bypass vulnerability in Quest NetVault Backup. The vulnerability is due to insufficient validation of the checksession parameter in multipart HTTP requests. Successful exploitation may result in successful bypass of the authentication mechanism.

Name	References	Description
Strike Mozilla Firefox Javascript Array.Prototype.Push Information Disclosure	CWE: 20 CVE: 2018-12387 BID: 105460	This strike exploits an information disclosure vulnerability in the Mozilla Firefox browser. Specifically, the JavaScript JIT compiler inlines Array.prototype.push with multiple arguments that result in the stack pointer being off by 8 bytes. When this occurs a memory address gets leaked that can be used as part of an exploit. This strike demonstrates the information disclosure by dumping the leaked memory addresses.
Strike Apache Pluto PortletV3Annotated Demo MultipartPortlet Arbitrary File Upload	CWE: 200 CVE: 2018-1306 EXPLOITDB : 45396	A file upload vulnerability was found in Apache Pluto PortletV3AnnotatedDemo. The vulnerability is due to improper access control of user-supplied input when the portlet performs a file-uploading operation. Successful exploitation can result arbitrary file upload and possible remote code execution in the context of the user running the webserver.
Strike Fortinet FortiOS and FortiProxy SSLVPN Web Portal Magic Improper Authorization	CVE: 2018-13382 CWE: 863	This strike exploits an improper authorization vulnerability in SSLVPN web portal of Fortinet FortiOS and FortiProxy. The vulnerability is due to improper authorization of the SSL VPN web portal component in FortiOS and FortiProxy. A remote, unauthenticated attacker could exploit this vulnerability by crafting a HTTP request containing a parameter called "magic" with the value "4tinet2095866". Successful exploitation could allow the attacker to modify the password of SSL VPN web portal in Fortinet FortiOS and FortiProxy.
Strike Xen Project XAPI Update Directory Traversal	CWE: 22 CVE: 2018-14007	This strike exploits a directory traversal vulnerability in the XAPI component of Xen. The vulnerability is due to insufficient handling of URL-encoded path components in requests sent to the pool update endpoint, used for supplying updates to other members of a resource pool. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation results in the disclosure of arbitrary file contents from the server, which may include the administrator token.
Strike OpenEMR manage_site_files Unrestricted File Upload	CWE: 434 CVE: 2018-15139	A file upload vulnerability was found in the OpenEMR. The vulnerability is caused by the lack of proper input sanitisation passed to the manage_site_files Web PHP form. Successful exploitation can result in arbitrary code execution in the context of the user running OpenEMR.
Strike Adobe ColdFusion CKEditor upload.cfm Directory Traversal	CWE: 20 CVE: 2018-15960 BID: 105317	This strike exploits a directory traversal vulnerability in Adobe ColdFusion CKEditor. The vulnerability is due to improper sanitization in the file upload.cfm. An attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could upload arbitrary files to the target server.
Strike Adobe ColdFusion CKEditor upload.cfm Unrestricted File Upload	CWE: 434 CVE: 2018-15961	This strike exploits an unrestricted file upload vulnerability in Adobe ColdFusion CKEditor. The vulnerability is due to improper restrictions on the files uploaded by users. By successfully exploiting this vulnerability, an remote, unauthenticated attacker could upload arbitrary files and execute them on the target server.

Name	References	Description
Strike LimeSurvey TCPDF phar Deserialization Remote Code Execution	CWE: 502 CVE: 2018-17057 EXPLOITDB : 46634	This strike exploits a remote code execution in LimeSurvey. The vulnerability resides in a PHP Phar deserialization within the 'TCPDF' component and can be exploited by uploading a malicious JPEG/Phar polyglot and exporting the survey that contains it. Exploiting this flaw requires authentication and results in remote code execution.
Strike MyBB Post Video Stored Cross Site Scripting	CWE: 79 CVE: 2018-17128	This strike exploits a stored cross site scripting vulnerability in MyBB platform. The vulnerability can be exploited by crafting a malicious video attachment when creating a new topic. By exploiting this flaw, an attacker obtains client-side Javascript code execution within victim's browser which can lead to information disclosure and credentials theft.
Strike Webmin history Parameter Cross-Site-Scripting	CWE: 79 CVE: 2018-19191	This strike exploits a cross-site scripting vulnerability in Webmin. The vulnerability results from the lack of sanitization when displaying the POST parameter 'history' in '/shell/index.cgi'. A successful exploitation leads to arbitrary code execution in visitors' browsers or credentials theft.
Strike phpMyAdmin Local File Inclusion	CWE: 200 CVE: 2018-19968	This strike exploits a remote file inclusion vulnerability in phpMyAdmin. The vulnerability is due to an improper filter, and the ability to execute a SQL sentence. By successfully exploiting this vulnerability, a remote, authenticated attacker could retrieve arbitrary files from the target server.
Strike Zoho ManageEngine OpManager SQL Injection in getGraphData API	CVE: 2018-20173	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the getGraphData API due to insufficient validation of input parameters such as name, index, and policyName. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary SQL commands on the application's database, potentially compromising its integrity and security.
Strike Oracle WebLogic Remote Diagnosis Assistant rda_tfa_hrs Command Injection	CWE: 78 CVE: 2018-2616	This strike exploits a command injection vulnerability in the web console of the Oracle WebLogic Remote Diagnosis Assistant. The vulnerability is due to improper input validation of HTTP parameter hrs_since menu command in the Java class OsUtils, the command string is not properly sanitized for command injection characters. A remote authenticated attacker can exploit this vulnerability by sending a crafted request to the target application. Successful exploitation could lead to arbitrary command execution on the target server with privileges of the Administrator user.
Strike Oracle WebLogic Server Fusion Middleware File Upload	CVE: 2018-2894	A file upload vulnerability was found in the Oracle WebLogic Server component of Oracle Fusion Middleware. The vulnerability is caused by the lack of proper input sanitisation of the Weblogic Web Service Test Page. Successful exploitation can result in arbitrary code execution in the context of the user running WebLogic.

Name	References	Description
Strike Trend Micro Control Manager sCloudService GetPassword SQL Injection	CWE: 89 CVE: 2018-3604	This strike exploits an SQL injection vulnerability in the Trend Micro Control Manager. The vulnerability is due to a lack of authentication for accessing the GetPoliciesOfProductType operation and a failure to sanitize the account parameter in the HTTP request. An external, unauthenticated attacker can leverage this vulnerability by sending a crafted HTTP request to the targeted server. Successfully exploiting this vulnerability may result in the execution of arbitrary SQL code within the context of the Network Service user.
Strike Apple Safari WebKit hoistSloppyModeFunctionIfNecessary Improper Object Validation	CWE: 119 CVE: 2018-4386 GOOGLE: 1665	This strike exploits a vulnerability in Apple Safari Webkit. Specifically the vulnerability exists in the BytecodeGenerator::hoistSloppyModeFunctionIfNecessary method. It is possible to craft Javascript in such a way that allows for an object to be passed as the property variable directly as a string to the op_get_direct_pname handler without being properly validated. This can lead to a denial of service in the browser application or potentially allow for remote code execution to occur.
Strike Advantech WebAccess SCADA certUpdate.asp Directory Traversal	BID: 102781 CWE: 22 CVE: 2018-5445	An arbitrary file overwrite vulnerability has been identified in Advantech WebAccess SCADA web platform. The vulnerability is caused by the lack of proper input sanitisation of the certUpdate.asp filename parameter. The vulnerability can be exploited by sending a specially-crafted request, allowing the attacker to execute code on the remote machine with the privileges of the application process.
Strike Joomla! Hathor Postinstall Message SQL Injection	CWE: 89 CVE: 2018-6376 BID: 102916	This strike exploits an SQL injection vulnerability in Joomla! CMS. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure, database corruption, denial of service and others.
Strike Schneider Electric IIoT Monitor Zip Directory Traversal	CWE: 434 CVE: 2018-7836	This strike exploits a directory traversal vulnerability in Schneider Electric IIoT Monitor. The vulnerability is due to insufficient handling of directory traversal characters in uploaded ZIP archives uploaded to several endpoints - ProtectionMgmt, RecoveryMgmt, and UpgradeMgmt. An authenticated attacker can exploit this weakness by uploading a crafted ZIP file, allowing them to traverse directories and write arbitrary files to locations accessible by SYSTEM. This vulnerability poses a significant risk of arbitrary code execution.
Strike Apache Superset Import Dashboards Remote Code Execution	CWE: 502 CVE: 2018-8021 EXPLOITDB : 45933	A remote code execution exists in Apache Superset through the 'Import Dashboards' feature. The vulnerability exists as a result of an insecure 'pickle' deserialization, allowing execution of arbitrary methods from the Python library. An authenticated attacker can therefore execute arbitrary code on the target system under the user that runs the 'gunicorn' webserver.

Name	References	Description
Strike Zoho ManageEngine OpManager OpManagerFailover Util customerName SQL Injection	CWE: 89 CVE: 2018-9088	This strike exploits an SQL injection vulnerability that exists in ManageEngine OpManager. The vulnerability results from a lack of input validation of the customerName request parameter and a lack of authentication for accessing FailOverHelperServlet servlet. A remote unauthenticated attacker could exploit this vulnerability by sending an HTTP request with a crafted customerName parameter. If the exploitation is successful, the server will execute a maliciously injected SQL statement, which may lead to data tampering in the OpManagerDB backend database and ultimately to the execution of arbitrary code with the privileges of database process.
Strike Jquery File Upload Arbitrary File Upload	CWE: 434 CVE: 2018-9206 EXPLOITDB : 45584 BID: 105679	This strike exploits an arbitrary file upload vulnerability in BlueImp Jquery File Upload widget. The vulnerability is due to the complete lack of server-side authorization or sanitization when handling a file upload. An attacker is thus able to create arbitrary files on the server which in most cases leads to remote arbitrary code execution.
Strike Microsoft Edge Chakra NewScObjectNoCtor Type Confusion	CWE: 119 CVE: 2019-0567 EXPLOITDB : 46203 BID: 106418 GOOGLE: 1702	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that when using the NewScObjectNoCtor or InitProto methods with the SetIsPrototype method of the type handler, a transition to a new type can cause type confusion to occur. This can lead to a denial of service in the browser or potentially lead to remote code execution.
Strike Kentico Unauthenticated Remote Code Execution via Insecure Dot Net Deserialization	CVE: 2019-10068 CWE: 502	This strike exploits an insecure deserialization vulnerability in Kentico. The vulnerability arises due to a failure to validate security headers in the staging service allowing an attacker to bypass authentication and perform arbitrary operation. An unauthenticated remote attacker can trigger insecure deserialization of user-controlled .NET objects, by sending a specially crafted request, leading to remote code execution. A successful attack could result in full compromise of the Kentico instance and underlying server.
Strike Citrix SD WAN SQL Injection	CWE: 89 CVE: 2019-12989	This strike exploits an SQL Injection vulnerability in Citrix SD-WAN. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted http requests containing shell metacharacters in sitename parameter to get_package_file endpoint. Successful exploitation could allow the attacker to achieve remote code execution.

Name	References	Description
Strike OpenEMR ajax_download.php Directory Traversal Vulnerability	CVE: 2019-14530	This strike exploits a directory traversal vulnerability in OpenEMR. The vulnerability is located in the ajax_download.php script, specifically in the improper validation of the fileName parameter. Exploiting this vulnerability allows a remote, authenticated attacker to read or delete arbitrary files on the server, potentially leading to information disclosure or denial-of-service conditions.
Strike Cisco DCNM SecurityManager Hard-Coded Cryptographic Key Authentication Bypass	CVE: 2019-15976	This strike exploits an authentication bypass vulnerability in Cisco Data Center Network Manager. The vulnerability exists due to the use of a hard-coded cryptographic key shared across installations for validating Single Sign-On (SSO) tokens. A remote, unauthenticated attacker could exploit this vulnerability by crafting a valid SSO token, allowing them to bypass authentication and execute arbitrary actions through the SOAP API with administrative privileges.
Strike Cisco Prime Data Center Network Manager Arbitrary File Upload	CWE: 264 CVE: 2019-1620 BID: 108906 EXPLOITDB : 47016	This strike exploits a path traversal vulnerability found in Cisco Data Center Network Manager (DCNM). The vulnerability is due to incorrect permission settings in affected DCNM software. An unauthenticated attacker could exploit this vulnerability by uploading a malicious file to the administrative web interface. A successful exploit could allow the attacker to write arbitrary files on the filesystem and execute code with root privileges on the affected device.
Strike Nostromo nhttpd http_verify Directory Traversal	CVE: 2019-16278 CWE: 22	This strike exploits a directory traversal vulnerability in Nostromo nhttpd server. The vulnerability is due to a failure on part of the http_verify function to properly parse user requests. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation could result in information disclosure and in the worst case, allows the attacker to execute arbitrary system commands under the context of the server process.
Strike WiKID 2FA Enterprise Server SQL Injection in searchDevices.jsp	CVE: 2019-16917	This strike exploits an SQL injection vulnerability in WiKID 2FA Enterprise Server. The vulnerability exists due to improper sanitization of user-supplied input in the searchDevices.jsp file. A remote, authenticated attacker could leverage this flaw by sending specially crafted HTTP requests, potentially leading to the execution of arbitrary SQL commands on the backend database.
Strike WiKID 2FA Enterprise Server processPref.jsp SQL Injection Vulnerability	CVE: 2019-17117	This strike exploits an SQL injection vulnerability in WiKID 2FA Enterprise Server. The vulnerability exists due to improper sanitization of user-supplied input in the processPref.jsp file. A remote, authenticated attacker can leverage this flaw by sending specially crafted HTTP requests, potentially leading to the execution of arbitrary SQL commands on the backend database.

Name	References	Description
Strike Cisco Prime Infrastructure Health Monitor - TarArchive Directory Traversal	CWE: 20 CVE: 2019-1821 BID: 108339 EXPLOITDB : 47016	This strike exploits a path traversal vulnerability found in Cisco Prime Infrastructure (PI) and Cisco Evolved Programmable Network (EPN) Manager. The vulnerability is due to improper validation of user-supplied input. An attacker could exploit this vulnerability by uploading a malicious file to the administrative web interface. A successful exploit could allow the attacker to execute code with root-level privileges on the underlying operating system.
Strike OpenEMR scanned_notes-new.php OS Command Injection	CWE: 77 CVE: 2019-3968	A command injection vulnerability exists in OpenEMR 5.0.1 and earlier, within 'scanned_notes/new.php' form file, as a result of weak user input sanitization. By sending a crafted 'id' parameter in a HTTP request, a remote authenticated attacker might execute arbitrary system commands.
Strike HPE IMC Expression Language Injection via beanName Parameter	CVE: 2019-5373	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability exists due to improper validation of the `beanName` parameter in the `CustomReportTemplateSelectBean` class. A remote, authenticated attacker can leverage this flaw to execute arbitrary code on the target system with SYSTEM-level privileges.
Strike HPE Intelligent Management Center Expression Language Injection Vulnerability cve_2019_5385	CVE: 2019-5385	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability resides in the insufficient validation of the beanName parameter within the perfSelectTask endpoint. Exploiting this flaw allows a remote attacker to execute arbitrary code on the target system under the security context of the SYSTEM user.
Strike Drupal Core Phar Stream Insecure PHP Deserialization	CWE: 20 CVE: 2019-6339	A remote code execution vulnerability exists in Drupal 7.x before 7.62, Drupal 8.5.x before 8.5.9 and Drupal 8.6.x before 8.6.6. The vulnerability is located within the PHP's built-in phar stream wrapper, when performing file operations on an untrusted 'phar://' URI. A remote attacker can exploit this vulnerability by sending a crafted HTTP packet to the target service. Successful exploitation could lead to arbitrary code execution or crash of the vulnerable application.
Strike SonicWall SMA100 SQL Injection Vulnerability	CWE: 89 CVE: 2019-7481	This strike exploits SQL injection vulnerability in SonicWall SMA100. The vulnerability is due to improper neutralization of special elements used in SQL command. Successful exploitation of this vulnerability could allow an attacker to execute arbitrary SQL commands, potentially leading to unauthorized access.
Strike Zoho ManageEngine ServiceDesk Plus Arbitrary File Upload	CWE: 434 CVE: 2019-8394 EXPLOITDB : 46413	This strike exploits a file upload vulnerability in Zoho ManageEngine ServiceDesk Plus. Files can be uploaded to the target by sending an HTTP POST request with a parameter 'module' equal to 'CustomLogin'. An attacker can send a malicious HTTP POST request to upload an arbitrary file to '/custom/login' folder. Successful exploitation may lead to creation and execution of arbitrary files by an authenticated user with minimum permissions (for example, guest).

Name	References	Description
Strike Synacor Zimbra Collaboration Suite Mailboxd Component XXE Vulnerability	CVE: 2019-9670 CWE: 611	This strike exploits an XXE vulnerability in Synacor Zimbra Collaboration Suite. This vulnerability lies in the Mailboxd component. A remote unauthenticated attacker can exploit this vulnerability by crafting a specially crafted XML payload containing malicious code and targeting the Autodiscover/Autodiscover.xml endpoint. Successful exploitation of this vulnerability could lead to data exposure.
Strike Sonatype Nexus Repository Manager ContentSelectorsApi Resource Stored Cross-Site Scripting	CWE: 79 CVE: 2020-10203	This strike exploits a stored cross-site scripting vulnerability in Sonatype Nexus Repository Manager. The vulnerability results from inadequate input validation in the content-selectors REST API request within the Java class ContentSelectorsApiResource. This flaw allows an authenticated attacker to inject malicious script code into the database by sending a carefully crafted request to the target server. Successful exploitation of this vulnerability could lead to the execution of arbitrary code within the security context of the user's browser.
Strike rconfig misconfigured post os command injection	CWE: 78 CVE: 2020-10221	This Strike exploits OS Command Injection Vulnerability against rconfig. The vulnerability is due to Improper Neutralization of elements such as HTTP POST in the configuration. An attacker can exploit this vulnerability by sending OS commands via shell metacharacters in the filename POST parameter. Successful Exploitation would result in the OS command Execution within the context of the user running rconfig.
Strike Advantech WebAccess NMS LicenseImportAction Arbitrary File Upload Vulnerability	CVE: 2020-10621	This strike exploits an arbitrary file upload vulnerability in Advantech WebAccess NMS. The vulnerability resides in the insufficient validation of file paths within the licenseImportAction.action endpoint. A remote, unauthenticated attacker could leverage this flaw to upload malicious files, potentially leading to arbitrary code execution under the SYSTEM user context.
Strike Advantech WebAccess NMS download.jsp Directory Traversal Vulnerability	CVE: 2020-10631	This strike exploits a directory traversal vulnerability in Advantech WebAccess NMS. The vulnerability is located in the download.jsp endpoint, where insufficient input validation is performed on the filename parameter. Exploiting this vulnerability allows a remote, unauthenticated attacker to read or delete arbitrary files on the target server, potentially leading to sensitive information disclosure or denial of service.
Strike rConfig search.crud.php OS Command Injection	CVE: 2020-10879 CWE: 74	This strike exploits a OS Command Injection vulnerability in the rConfig server. The vulnerability is in the 'nodeId' parameter in the 'search.crud.php' module, due to failure to properly sanitize the user-supplied input. A remote, authenticated attacker can create a malicious HTTP request resulting in arbitrary command execution on the target system with the privileges of the user running the web server.

Name	References	Description
Strike Apache Airflow Command Injection	CWE: 78 CVE: 2020-11978	This strike exploits remote code/command injection vulnerability in Apache Airflow. This vulnerability was discovered in one of the example DAGs(Directed Acyclic Graph) shipped with Airflow which would allow any user to run arbitrary commands as the user running airflow worker/scheduler(depending on the executor in use). A remote unauthenticated attacker can exploit this vulnerability by sending a crafted request to apache airflow. *NOTE: When running this strike in OneArm mode, first it searches for the example_trigger_target_dag on the target server. If found, then it unpauses the example dag and then creates a DAG(it is a collection of all the tasks that one may want to run), which in this case is creation of a file /tmp/test .
Strike rConfig vendors.crud.php Arbitrary File Upload Vulnerability	CVE: 2020-12255	This strike exploits an arbitrary file upload vulnerability in the rConfig Network Device Configuration Tool. The vulnerability resides in the improper validation of the HTTP multipart/form-data request parameter vendorLogo within the vendors.crud.php script. Exploiting this vulnerability allows a remote authenticated attacker to upload malicious files, potentially leading to arbitrary code execution under the security context of the affected service.
Strike rConfig Network Device Configuration Tool devicemgmt.php Cross-Site Scripting	CWE: 79 CVE: 2020-12256	This strike exploits a cross-site scripting vulnerability in rConfig Network Device Configuration Tool. The vulnerability is due to improper validation of the user-supplied request parameter deviceId by devicemgmt.php. A remote attacker could exploit this vulnerability by enticing a victim to open a link or a web page. Successful exploitation could result in the execution of script code in security context of the target users browser.
Strike rConfig Network Device Configuration Tool configDevice.php Cross-Site Scripting	CWE: 79 CVE: 2020-12259	This strike exploits a cross-site scripting vulnerability in rConfig Network Device Configuration Tool. The vulnerability arises from inadequate validation of the 'rid' request parameter in configDevice.php. A remote attacker could exploit this vulnerability by enticing a victim to open a link or a web page. If successfully exploited, this could lead to the execution of script code within the security context of the targeted user's browser.
Strike Roundcube Webmail im_convert_path RCE Vulnerability	CWE: 78 CVE: 2020-12641	This strike exploits remote code execution vulnerability in Roundcube webmail. The vulnerability is due to the im_convert_path configuration setting, which allows a remote, unauthenticated attacker with access to the Roundcube installer to inject system commands. These commands execute whenever a user opens an email containing a "non-standard" image. Successful exploitation could lead to arbitrary command execution.
Strike Centreon RRDdatabase_status_path Command Injection Vulnerability	CVE: 2020-13252	This strike targets a command injection vulnerability in the Centreon Web Application. The issue arises from improper validation of the `RRDdatabase_status_path` parameter in HTTP requests. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary commands on the server with the privileges of the web server process.

Name	References	Description
Strike Apache Kylin REST API Command Injection Vulnerability	CVE: 2020-13925	This strike exploits a command injection vulnerability in Apache Kylin. The vulnerability resides in the diag REST API endpoint, specifically in the DiagnosisService class, where user-supplied input is insufficiently validated. An authenticated remote attacker could leverage this flaw by sending crafted HTTP requests, leading to arbitrary command execution on the server.
Strike Apache OpenMeetings NetTest Denial of Service	CWE: 835 CVE: 2020-13951	This strike exploits a denial of service vulnerability in Apache OpenMeetings 4.0.0 - 5.0.0. The vulnerability is caused by a lack of rate limiting on NetTest. A remote, unauthenticated attacker can send a large number of requests to the server resulting in network exhaustion and denial of service.
Strike Oracle Business Intelligence Enterprise Edition Path Traversal	CWE: 22 CVE: 2020-14864	This strike exploits a directory traversal vulnerability in Oracle Business Intelligence Enterprise Edition. This vulnerability is due to the getPreviewImage function which is used to get the preview image of a previously uploaded theme logo. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request by manipulating the previewFilePath URL parameter. Successful exploitation of this vulnerability could allow an attacker to read sensitive files, execute arbitrary code, or gain unauthorized access to the system.
Strike Ivanti MobileIron Remote Code Execution Vulnerability	CWE: 706 CVE: 2020-15505	This strike exploits a remote code execution vulnerability in MobileIron products. The vulnerability exists in a Tomcat Web Service that deserializes user input using the Hessian format. This unsafe deserialization allows malicious input to be executed, leading to potential remote code execution. Attackers can leverage the inconsistency between Apache and Tomcat to bypass access controls and execute malicious payloads by exploiting deserialization vulnerabilities in the Hessian format. Successful exploitation of this vulnerability could allow a remote, unauthenticated attacker to execute arbitrary code on the affected system.
Strike Microsoft Exchange Server DlpUtils AddTenantDlpPolicy Remote Code Execution	CWE: 94 CVE: 2020-16875	A remote code execution vulnerability exists in Microsoft Exchange Server due to improper validation of cmdlet arguments. A remote authenticated attacker can exploit this vulnerability by running a particular cmdlet with crafted arguments against a vulnerable Exchange server. Successful exploitation could result in the execution of arbitrary commands as SYSTEM.
Strike Fuel CMS Col Parameter SQL Injection Vulnerability	CWE: 89 CVE: 2020-17463	This strike exploits an SQL injection vulnerability in Fuel CMS. This vulnerability lies in the parameter col in permission/items, logs/items, pages/items, navigation/items. An authenticated attacker can exploit this vulnerability by crafting a specially crafted SQL payload. Successful exploitation of this vulnerability could lead to unauthorized access, data leakage and data manipulation.
Strike Apache Flink FileUploadHandler Arbitrary File Upload	CWE: 22 CVE: 2020-17518	This strike exploits a file upload vulnerability in Apache Flink. The vulnerability is due to insufficient input validation while uploading files in the FileUploadHandler class. A remote, unauthenticated attacker can exploit this vulnerability by submitting a crafted request to the target server results in the writing of an arbitrary file to any location writable by the target server. *NOTE: When running this strike in OneArm mode, a randomly generated file is uploaded in the /tmp directory of the target machine .

Name	References	Description
Strike PHP-Fusion Downloads.php Command Injection	CWE: 269 CVE: 2020-24949	This strike simulates a command injection vulnerability in PHP-Fusion. The vulnerability is due to insufficient validation of HTTP request parameters in downloads.php. A remote unauthenticated attacker could exploit this vulnerability by sending an crafted HTTP request to the vulnerable server. Successful exploitation of this vulnerability could allow the attacker to execute command in the security context of the running server.
Strike Advantech R-SeeNet device_position.php SQL Injection Vulnerability	CVE: 2020-25157	This strike exploits a SQL injection vulnerability in Advantech R-SeeNet. The vulnerability exists due to insufficient validation of the device_id parameter in the device_position.php file. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted HTTP requests, potentially leading to the retrieval of sensitive information from the database.
Strike WordPress File Manager connector_minimal.php Improper Access Control	CWE: 434 CVE: 2020-25213	This strike exploits an improper access control vulnerability in the File Manager plugin for WordPress. The vulnerability arises from inadequate access control for the connector_minimal.php file during file uploads. This allows an unauthenticated attacker to upload arbitrary files, including potentially malicious PHP files, posing a risk of executing arbitrary code. A remote, unauthenticated attacker could exploit this vulnerability by submitting a carefully crafted request to a WordPress server with the File Manager Plugin installed. Successful exploitation could lead to the unauthorized upload of arbitrary files, potentially resulting in the execution of arbitrary code within the security context of the WordPress server.
Strike Cisco Security Manager AuthTokenServlet Insecure Deserialization	CWE: 502 CVE: 2020-27131	The strike exploits an insecure deserialization vulnerability in Cisco Security Manager. The vulnerability is due to insufficient validation of serialized data, passed via HTTP(S) request to /CSCOnm/servlet/com.cisco.nm.cmf.servlet.AuthTokenServlet, causing deserialization of untrusted data while having exploitable libraries in the code path. A remote, unauthenticated attacker can exploit this vulnerability by sending a specially crafted serialized object to the target server. Successful exploitation can result in arbitrary code execution as root.
Strike Zyxel Products Use of Hard-Coded Credentials	CWE: 522 CVE: 2020-29583	This strike exploits an use of Hard-Coded Credentials Vulnerability in Zyxel Multiple Products. This vulnerability is due to an undocumented account (zyfwp) with an unchangeable password. The account is designed to deliver automatic firmware updates to connected access points through FTP. A remote, unauthenticated attacker could exploit this vulnerability to gain unauthorized access to the affected device, potentially leading to further compromise of the network.
Strike Cisco UCS Director ApplianceStorageUtil Directory Traversal	CWE: 22 CVE: 2020-3239	A directory traversal vulnerability exists in Cisco UCS Directory. The vulnerability is due to insufficient validation of user input within 'ApplianceStorageUtil' class. A remote authenticated attacker can exploit the vulnerability by sending malicious requests to the target server. Successful exploitation could result in the arbitrary file write and remote code execution under the security context of web server.

Name	References	Description
Strike Cisco UCS Director Directory Traversal Vulnerability	CVE: 2020-3251	This strike exploits a directory traversal vulnerability in Cisco UCS Director. The vulnerability exists due to insufficient validation of user input within the MyCallable class when processing file upload requests. A remote authenticated attacker could leverage this flaw to write arbitrary files to the server, potentially leading to remote code execution under the web server's security context.
Strike Nagios XI Manage Plugins Command Injection	CWE: 78 CVE: 2020-35578	This strike exploits a command injection vulnerability in the admin webpage 'monitoringplugins.php' script for Nagios XI. The flaw is due to the insufficient validation of the 'uploadedfile' multipart filename. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the Nagios user on the target server.
Strike Webmin Package Updates update.cgi Command Injection	CWE: 78 CVE: 2020-35606	This strike exploits a command injection vulnerability in Webmin. The vulnerability is due to the insufficient validation of input in the Package Updates module. A remote attacker could exploit this vulnerability by sending a crafted request to the target system. Successful exploitation of this vulnerability could result in arbitrary command execution on the target system.
Strike OpenEMR Backup php Command Injection	CWE: 78 CVE: 2020-36243	This strike exploits a command injection vulnerability in OpenEMR. This vulnerability is due to insufficient sanitation for the user-supplied data in the backup.php. A remote authenticated attacker can exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary command execution in the security context as web server. *NOTE: When running this strike in OneArm mode, the requests will not be sent to /openemr/someuri , instead will be sent to /someuri , since the openemr server docker used, is configured that way.
Strike VMware Multiple Products ApplianceSslCertificateService Command Injection	CWE: 77 CVE: 2020-4006	This strike exploits a command injection vulnerability in VMware Workspace One Access, Access Connector, Identity Manager, and Identity Manager Connector. The vulnerability is due to improper validation of user input in the 'san' parameter. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the service running on the target server.
Strike IBM Spectrum Protect Plus uploadHttpsCertificate Command Injection	CVE: 2020-4241 CWE: 78	This strike exploits a command injection vulnerability in IBM Spectrum Protect Plus. The vulnerability is due to a lack of input sanitization for injection or invalid characters in the filename parameter. When an attacker sends an HTTP POST request to the "/emi/api/uploadhttpscertificate" URI, command execution can occur.
Strike Ruby on Rails locals render Remote Code Execution	CWE: 94 CVE: 2020-8163	A remote code execution vulnerability exists in Ruby on Rails versions 5 < 5.0.1 and 4 < 4.2.11.2, due to lack of user input validation. The vulnerability manifests itself whenever the 'locals' value for a 'render' call is set to 'params' value. Remote attackers may exploit applications containing the up-mentioned pattern by sending a crafted HTTP request to obtain arbitrary code execution.

Name	References	Description
Strike Squid Reverse Proxy Host Header Buffer Overflow	CWE: 119 CVE: 2020-8450	A stack-based buffer overflow vulnerability exists in Squid before 4.10 due to incorrect buffer management, when acting as a reverse proxy. By sending a crafted HTTP request with a host string longer than 255 characters in the 'Host' header, a remote attacker may achieve remote code execution on the target host.
Strike Trend Micro Apex One and OfficeScan Directory Traversal CVE 2020-8599	CWE: 434 CVE: 2020-8599	This strike exploits a directory traversal vulnerability in Trend Micro Apex One and OfficeScan. The vulnerability is due to improper validation of user-supplied file name in the X_DTDAS_Archive_Filename HTTP header when handling a request for sample file upload. Since a remote unauthenticated attacker can control both the file name and file content, this directory traversal vulnerability could allow the attacker to modify executable files in the target system, which could then lead to remote code execution in the context of IUSR account.
Strike Webmin log_parser.pl Stored Cross-Site Scripting	CWE: 74 CVE: 2020-8821	A stored XSS vulnerability exists in Webmin 1.941 and earlier, affecting the Command-Shell module. The flaw is due to lack of HTML character escaping when rendering log entries and is located in 'shell/log_parser.pl' script. An authenticated remote attacker may send a crafted POST body to obtain arbitrary JavaScript execution on a target user's browser.
Strike Cisco HyperFlex HX storfs-asup Handling Remote Command Execution	CWE: 78 CVE: 2021-1498	This strike exploits a remote command execution vulnerability in Cisco HyperFlex. The vulnerability is due to improper sanitization of user supplied data. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could lead to execution of arbitrary code in the context of target process.
Strike SonicWall SMA 100 Appliances Stack-Based Buffer Overflow	CWE: 787 CVE: 2021-20038	This strike exploits stack-based buffer overflow vulnerability in SonicWall SMA 100 Appliances. This vulnerability arises from how environment variables are concatenated into a string within mod_cgi.so and also that the attacker-provided QUERY_STRING is not subjected to any type of length check. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted request to the target server. Successfully exploiting this vulnerability could allow attacker to potentially execute code as a 'nobody' user or crash the affected system.
Strike Zoho ManageEngine ServiceDesk Plus Custom Schedules Command Injection Vulnerability	CVE: 2021-20081	This strike exploits an arbitrary command execution vulnerability in Zoho ManageEngine ServiceDesk Plus. The vulnerability resides in the improper validation of user input within the custom-schedules module. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to arbitrary command execution and potential remote code execution under the SYSTEM security context.
Strike Arcadyan Buffalo Firmware Path Traversal	CWE: 22 CVE: 2021-20090	This strike exploits a directory traversal vulnerability in Arcadyan Buffalo Firmware. This vulnerability is due to the improper access permission set for a list of folders and files. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation of this vulnerability could lead to read sensitive files, such as configuration files, credentials, or other sensitive information.

Name	References	Description
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability cve_2021_20130	CVE: 2021-20130	This strike exploits an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The vulnerability exists due to insufficient validation of uploaded files in the PasswordExpiryAction class. A remote authenticated attacker can leverage this flaw to upload malicious files, potentially leading to remote code execution with SYSTEM privileges.
Strike VMware vCenter vSphere Client Arbitrary File Upload	CWE: 269 CVE: 2021-21972 EXPLOITDB : 49602	This strike exploits a file upload vulnerability in vSphere Client component of VMware vCenter. An remote unauthenticated attacker can send a malicious HTTP POST request to upload an arbitrary file via '/ui/vropspluginui/rest/services/uploadova' api. Successful exploitation may lead to creation and execution of arbitrary files with the context of the NT AUTHORITY\SYSTEM for windows and vsphere-ui user for linux.
Strike VMware View Planner Arbitrary File Upload	CWE: 434 CVE: 2021-21978 EXPLOITDB : 49602	This strike exploits a file upload vulnerability in VMware View Planner. An remote unauthenticated attacker can send a malicious HTTP POST request to upload an arbitrary file via 'logupload' endpoint. Successful exploitation can lead to execution of arbitrary code on the target system with root privileges.
Strike ExifTool DjVu Remote Code Execution	CWE: 74 CVE: 2021-22204	This strike exploits an improper neutralization of directives in dynamically evaluated code ('eval injection') in ExifTool. An remote unauthenticated attacker can supply a malicious crafted DjVu file to be processed via ExifTool. Successful exploitation may lead to execution of arbitrary code with the context of the user running the ExifTool. Note: This strike exploits GitLab CE which runs the ExifTool internally. GitLab also identifies this same vulnerability with CVE-2021-22205.
Strike GitLab Community and Enterprise Edition Remote Command Execution	CWE: 94 CVE: 2021-22205	This strike exploits a remote code execution vulnerability in GitLab Community and Enterprise Editions. This vulnerability is due to improper validation of image files that are passed to file parser. A remote, authenticated attacker could exploit this vulnerability by sending specially crafted image file to an unspecified endpoint. Successfully exploiting this vulnerability could result in remote command execution on the target system.
Strike Advantech iView CommandServlet Directory Traversal Vulnerability	CVE: 2021-22656	This strike exploits a directory traversal vulnerability in Advantech iView. The vulnerability arises from improper validation of user-supplied input in the CommandServlet Java class. A remote, unauthenticated attacker could leverage this flaw by sending crafted HTTP requests, potentially leading to the disclosure of sensitive files and information on the server.
Strike Schneider Electric Struxureware Data Center Expert Command Injection Vulnerability	CVE: 2021-22795	This strike exploits a command injection vulnerability in Schneider Electric Struxureware Data Center Expert. The vulnerability exists due to improper sanitization of the "config" parameter in HTTP POST requests to the "/nbc/compress/repository/test" endpoint. A remote, authenticated attacker could leverage this flaw to execute arbitrary commands on the system with root privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Citrix ShareFile Storage Zones Controller NeatUpload Directory Traversal	CVE: 2021-22941 CWE: 284	The vulnerability allows remote attackers to save files to an arbitrary file path under the web root directory in the NeatUpload library of Citrix ShareFile Storage Zones Controller due to improper validation of an ID parameter in file upload requests. Successful exploitation could result in the execution of arbitrary code on the target server.
Strike Joomla mod_breadcrumbs Title Store Cross-Site Scripting	CWE: 79 CVE: 2021-23124	This strike exploits a cross-site scripting vulnerability in Joomla CMS. This vulnerability is due to inadequate input filtering in the title attribute of mod_breadcrumbs. Successful exploitation could result in arbitrary script code being executed in the security context of the browser.
Strike Oracle Business Intelligence BIRemotingServlet Insecure Deserialization Vulnerability	CVE: 2021-2456	This strike exploits an insecure deserialization vulnerability in Oracle Business Intelligence. The vulnerability arises from improper validation of AMF3 objects in requests to the BIRemotingServlet. A remote attacker can leverage this flaw by sending specially crafted AMF packets, leading to arbitrary code execution in the context of the affected server.
Strike Nagios XI Web SSH Terminal sshterm Cross-Site Scripting	CWE: 79 CVE: 2021-25299	This strike exploits a cross-site scripting vulnerability in Nagios XI 5.7.5 . This vulnerability is due to improper validation of the url parameter in sshterm.php while accessing the web SSH terminal.A remote attacker can exploit this vulnerability by enticing the user to visit a specially crafted link or page. Successful exploitation could result in arbitrary script code being executed in the security context of the browser.
Strike CMS Made Simple Server-Side Template Injection Vulnerability	CVE: 2021-26120	This strike exploits a server-side template injection vulnerability in CMS Made Simple. The vulnerability exists due to improper validation of user-supplied input in the "name" parameter of the "{function}" tag within the Smarty template engine. A remote, authenticated attacker could leverage this flaw to execute arbitrary code on the affected system, potentially gaining full control over the server.
Strike Microsoft Exchange New-DlpPolicy Cmdlet Remote Code Execution Vulnerability	CVE: 2021-26412	This strike targets a remote code execution vulnerability in Microsoft Exchange Server. The issue arises from improper validation of the "commandBlock" tag in DLP policy templates when processing the "ruleParameters" tag. Exploiting this flaw allows an authenticated attacker to execute arbitrary commands with SYSTEM privileges on the affected server.
Strike Microsoft Exchange FilePathName Arbitrary File Write	CVE: 2021-27065 CWE: 73 EXPLOITDB : 49637	An arbitrary file upload vulnerability exist in Microsoft Exchange Server due to lack of sanitization of 'FilePathName' parameter in Virtual Directory reset requests. A remote authenticated attacker may send crafted JSON HTTP requests to upload a webshell on the target system and execute arbitrary commands as the SYSTEM user.

Name	References	Description
Strike Netgear ProSAFE NMS300 Arbitrary File Deletion Vulnerability	CVE: 2021-27272	This strike exploits an arbitrary file deletion vulnerability in Netgear ProSAFE NMS300. The vulnerability resides in the ReportTemplateController class, specifically in the clear() method, which fails to properly sanitize directory traversal characters in the path parameter. A remote authenticated attacker could leverage this flaw by sending crafted HTTP requests to delete arbitrary files on the server, potentially leading to denial-of-service conditions.
Strike Netgear ProSAFE NMS300 Post-Authentication Command Injection Vulnerability	CVE: 2021-27273	This strike exploits a command injection vulnerability in Netgear ProSAFE NMS300. The vulnerability exists due to insufficient validation of the "fileName" parameter in the rebootSystem() method of the SettingConfigController class. A remote, authenticated attacker could leverage this flaw by sending specially crafted HTTP requests, leading to the execution of arbitrary commands with SYSTEM privileges.
Strike Netgear ProSAFE NMS300 Unrestricted File Upload Vulnerability	CVE: 2021-27274	This strike exploits an unrestricted file upload vulnerability in Netgear ProSAFE NMS300. The vulnerability resides in the MFileUploadController class, specifically in the uploadFile() method, which fails to properly validate the file type and parameters of uploaded files. A remote attacker could exploit this vulnerability by uploading a malicious file, leading to arbitrary code execution under the security context of SYSTEM.
Strike Apache Solr ReplicationHandler SSRF Vulnerability	CVE: 2021-27905	This strike exploits a server-side request forgery vulnerability in Apache Solr. The vulnerability is located in the ReplicationHandler's handling of the masterUrl and leaderUrl parameters. Exploiting this vulnerability allows a remote attacker to perform arbitrary file writes, disclose sensitive information, and spoof server conditions.
Strike Apache Superset Markdown Component Stored Cross-Site Scripting	CWE: 79 CVE: 2021-27907	This strike exploits a stored cross-site scripting vulnerability in the Markdown component of Apache Superset. This vulnerability is due to insufficient validation of Markdown snippet in a dashboard. A remote authenticated attacker can exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary script execution in the target user's browser.
Strike Alibaba Nacos AuthFilter Authentication Bypass Vulnerability	CVE: 2021-29441	This strike exploits an authentication bypass vulnerability in Alibaba Nacos. The vulnerability is located in the AuthFilter servlet filter implementation, specifically in the doFilter method of the AuthFilter class. Exploiting this vulnerability allows a remote, unauthenticated attacker to gain unauthorized access to endpoints that typically require authentication.
Strike Ivanti Avalanche imageFilePath Directory Traversal Vulnerability	CVE: 2021-30497	This strike exploits a directory traversal vulnerability in Ivanti Avalanche. The vulnerability resides in the improper validation of the "imageFilePath" parameter in HTTP requests. A remote, unauthenticated attacker could leverage this flaw to access arbitrary files on the server, potentially leading to the disclosure of sensitive information.
Strike WebSVN Search.php Command Injection Vulnerability	CVE: 2021-32305	This strike exploits a command injection vulnerability in WebSVN. The vulnerability exists due to improper sanitization of the "search" parameter in requests sent to the search.php endpoint. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary commands with the privileges of the web server on the target system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SmartStoreNET ForumPost Stored Cross-Site Scripting Vulnerability	CVE: 2021-32608	This strike exploits a stored cross-site scripting vulnerability in SmartStoreNET. The vulnerability resides in the improper handling of BBCode url tags within forum posts. A remote attacker could exploit this flaw by posting maliciously crafted forum messages, leading to arbitrary script execution in the browser of users viewing the affected pages.
Strike Studio-42 elFinder Archive Command Injection Vulnerability	CVE: 2021-32682	This strike exploits a command injection vulnerability in Studio-42 elFinder. The vulnerability resides in the insufficient validation of the "name" parameter when creating an archive in the makeArchive function. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary commands with the privileges of the web server process.
Strike WooCommerce Blocks WordPress Plugin SQL Injection Vulnerability	CVE: 2021-32789	This strike exploits an SQL injection vulnerability in the WooCommerce Blocks WordPress plugin. The vulnerability arises from insufficient input validation in the "calculate_attribute_counts" parameter of the "/wc/store/products/collection-data" API endpoint. A remote, unauthenticated attacker can exploit this flaw by sending crafted HTTP requests, leading to the execution of arbitrary SQL SELECT queries and unauthorized retrieval of database information.
Strike Delta Industrial Automation DIAEnergie Arbitrary File Upload Vulnerability	CVE: 2021-32955	This strike exploits an arbitrary file upload vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability resides in the HandlerPage_KID endpoint due to insufficient input validation on the HtmlId parameter and lack of authentication. A remote, unauthenticated attacker could leverage this flaw to upload malicious files, potentially leading to arbitrary code execution on the server.
Strike Foxit Reader and Editor Use-After-Free Vulnerability in Annotation Handling	CVE: 2021-34833	This strike exploits a use-after-free vulnerability in Foxit PDF Reader and Editor. The vulnerability resides in the improper handling of the author property of Annotation objects within JavaScript. Exploiting this flaw allows a remote attacker to execute arbitrary code by enticing a user to open a maliciously crafted PDF file.
Strike Hikvision Improper Input Validation	CWE: 78 CVE: 2021-36260	This strike exploits a command injection vulnerability in Hikvision IP camera/NVR firmware. The vulnerability is due to the insufficient input validation. It inserts a command into an XML payload used with an HTTP PUT request sent to the '/SDK/webLanguage' endpoint, resulting in command execution as the root user. A remote, unauthenticated attacker could exploit the vulnerability to launch a command injection attack by sending some messages with malicious commands.
Strike Nagios XI Post-auth RCE through Path Traversal	CWE: 22 CVE: 2021-37343	This strike exploits a path traversal vulnerability in Nagios XI versions prior to 5.8.5 . This vulnerability is due to improper validation of the job parameter in autodiscovery feature. A remote authenticated attacker can exploit this vulnerability by sending a crafted request. Successful exploitation could result in arbitrary file creation and further more can result in arbitrary code being executed in the context of the web server. Note: This strike contains just the authentication and the request required to create a backdoor in the web server.

Name	References	Description
Strike Centreon ProceduresProxy.class.php SQL Injection Vulnerability	CVE: 2021-37558	This strike exploits an SQL injection vulnerability in the Centreon web application. The vulnerability is located in the ProceduresProxy.class.php file, specifically within the getHostId() and getServiceId() functions, which fail to properly sanitize the host_name and service_description parameters. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or further compromise of the target system.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability cve_2021_37921	CVE: 2021-37921	This strike targets an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The issue arises from insufficient validation of uploaded files in the ReportsAction class. Exploiting this flaw allows a remote authenticated attacker to upload arbitrary files, potentially leading to remote code execution with SYSTEM privileges.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability cve_2021_37926	CVE: 2021-37926	This strike exploits an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The vulnerability exists due to insufficient validation of file types in the LicenseAction class when handling uploaded files. A remote authenticated attacker can leverage this flaw to upload malicious files, potentially leading to remote code execution with SYSTEM-level privileges.
Strike Google Chrome Hole Memory Corruption	CWE: 755 CVE: 2021-38003	This strike exploits a vulnerability in the V8 in Google Chrome. The vulnerability exists due to improper handling of the internal TheHole value when an exception occurs during execution. By crafting specific inputs, it is possible to trigger a scenario where TheHole leaks into JavaScript code. Successful exploitation could result in memory corruption.
Strike Microsoft Azure Open Management Infrastructure Authentication Bypass	CWE: 305 CVE: 2021-38647	This strike exploits an authentication bypass vulnerability in Microsoft Azure Open Management Infrastructure. The vulnerability is due to improper validation of the Authorization header in the HTTP request supplied. A remote attacker could exploit this vulnerability by sending a crafted request to a vulnerable server. A successful attack might result in the remote code execution in the context of root user.
Strike VMware NSX Manager XStream Remote Code Execution Vulnerability	CWE: 502 CVE: 2021-39144	This strike exploits an insecure deserialization vulnerability in the XStream library in VMWare NSX Manager. This flaw, originally identified as an XStream deserialization issue, leverages the application's XML processing to execute arbitrary code. Due to inadequate input validation in XStream, the application deserializes untrusted XML data insecurely. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted XML payload to an unauthenticated API endpoint. Successful exploitation could allow the attacker to execute code with elevated privileges, potentially leading to full system compromise.
Strike Nagios XI Custom Includes Component Arbitrary File Upload Vulnerability	CVE: 2021-40344	This strike exploits an arbitrary file upload vulnerability in the Custom Includes component of Nagios XI. The vulnerability resides in the misconfiguration of the .htaccess file within the /images subdirectory of the component. A remote, authenticated attacker can leverage this flaw to upload and execute malicious PHP code, potentially leading to arbitrary code execution under the web server's security context.

Name	References	Description
Strike Nagios XI cmdsubsys.php Command Injection Vulnerability	CVE: 2021-40345	This strike targets a command injection vulnerability in the cmdsubsys.php script of Nagios XI. The issue arises from improper sanitization of user-supplied input in the names of files within uploaded Zip archives. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary commands with the privileges of the nagios user.
Strike Aviatrix Controller Unrestricted File Upload	CVE: 2021-40870 CWE: 23	This strike exploits a file upload vulnerability in Aviatrix Controller. The vulnerability allows unauthenticated attackers to upload malicious files, which can then be exploited via directory traversal to execute arbitrary code. Successful exploitation of this vulnerability allows remote attackers to execute arbitrary commands on the affected system.
Strike Netgate pfSense diag_routes.php Command Injection Vulnerability	CVE: 2021-41282	This strike exploits a command injection vulnerability in Netgate pfSense. The vulnerability resides in the diag_routes.php file due to insufficient validation of user-supplied input in the filter parameter. A remote, authenticated attacker can leverage this flaw to execute arbitrary operating system commands, potentially leading to full system compromise.
Strike Ivanti Avalanche Central FileStore Command Injection Vulnerability	CVE: 2021-42129	This strike exploits a command injection vulnerability in Ivanti Avalanche Enterprise Service. The vulnerability exists due to insufficient validation of input fields in the Central FileStore configuration settings. A remote, authenticated attacker could leverage this flaw by sending crafted requests, leading to the execution of arbitrary commands on the server with SYSTEM privileges.
Strike Zoho ManageEngine Network Configuration Manager Ping Command Injection	CWE: 77 CVE: 2021-43319	This strike exploits a command injection vulnerability in Zoho ManageEngine Network Configuration Manager. The vulnerability is due to insufficient validation in the ipaddress field of the ping functionality in add device web interface. A remote, authenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could lead to arbitrary code execution in the security context of the web server. *Note : Upon running the strike in one-arm mode a file named Test is created in /tmp directory of the vulnerable server. The default credentials being used are admin/admin.
Strike FusionPBX fax_send.php Command Injection Vulnerability	CVE: 2021-43405	This strike exploits a command injection vulnerability in the fax_send.php script of FusionPBX. The vulnerability exists due to insufficient input validation of the fax_extension parameter in HTTP requests. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary system commands with the privileges of the server process.
Strike Roundcube Webmail SQL Injection Vulnerability	CWE: 89 CVE: 2021-44026	This strike exploits an SQL injection vulnerability in Roundcube. The vulnerability is due to insufficient validation of user-provided search_params data. To execute the attack, the malicious actor must first authenticate within a Roundcube session. Upon successful exploitation, the attacker could read sensitive information, modify database content, or escalate privileges based on the permissions granted to the database account that Roundcube utilizes.

Name	References	Description
Strike Zoho ManageEngine ImportTechniciansAction Arbitrary File Upload	CWE: 287 CVE: 2021-44077	This strike exploits an arbitrary file write vulnerability that has been reported in Zoho ManageEngine ServiceDesk Plus, ServiceDesk Plus MSP, and SupportCenter Plus. The vulnerability is due to insufficient validation of input data. An unauthenticated remote attacker can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation results in the writing of an arbitrary file to the target application, potentially leading to execution of arbitrary code as SYSTEM.
Strike Zoho Desktop Central Authentication Bypass Vulnerability	CWE: 287 CVE: 2021-44515	This strike exploits an authentication bypass vulnerability in ManageEngine Desktop Central. The vulnerability is due to an input validation error in the StateFilter class. A remote, unauthenticated attacker could bypass the authentication of the console component and then send commands via WebSockets to the managed devices by the ManageEngine Desktop Central server. This may potentially cause remote code execution, allowing a malicious, unauthenticated attacker to execute arbitrary code on the devices managed by the ManageEngine Desktop Central server.
Strike Ivanti EPM Cloud Services Appliance Code Injection Vulnerability	CWE: 94 CVE: 2021-44529	This strike exploits a command injection vulnerability in the Ivanti Cloud Services Appliance (CSA) for Ivanti Endpoint Manager. The vulnerability is due to insufficient input validation and improper handling of cookie data. The vulnerable code allows an unauthenticated attacker to inject and execute arbitrary PHP code by crafting specific cookie headers, leading to execution of base64-encoded payloads via the eval() function. Successful exploitation results in command execution as the 'nobody' user.
Strike Apache httpd mod_lua Integer Underflow	CWE: 191 CVE: 2021-44790	A integer underflow vulnerability exists in multiple versions of Apache Software Foundation httpd prior to 2.4.52. The flaw is due to improper handling of the request body. An unauthenticated remote attacker may sent a crafted request to the target server. Successful exploitation could result in remote code execution or denial of service condition. * Target Apache server must have the mod_lua module enabled and have the lua-script handler set for Lua scripts stored on the server. * The target must contain a Lua script utilizing the r:parsebody() function.
Strike D Link Multiple Routers Remote Code Execution Vulnerability	CVE: 2021-45382 CWE: 78	This strike exploits an OS command injection vulnerability in D-Link Routers. The vulnerability is due to insufficient validation of user supplied input. An unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request and might result in remote code execution.
Strike WordPress Photo Gallery Plugin SQL Injection Vulnerability	CVE: 2022-0169	This strike exploits a SQL injection vulnerability in the WordPress Photo Gallery plugin. The vulnerability arises from improper sanitization of the `bwg_tag_id_bwg_thumbnails_0` parameter in HTTP requests. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to data exfiltration or unauthorized access.

Name	References	Description
Strike Oracle JDeveloper ADF Faces Deserialization of Untrusted Data Vulnerability	CVE: 2022-21445 CWE: 502	This strike exploits an insecure deserialization vulnerability in Oracle JDeveloper ADF Faces. The vulnerability is due to insufficient validation of HTTP request. A remote unauthenticated attacker can exploit this vulnerability by sending crafted HTTP request to the vulnerable server. Successful exploitation of this vulnerability could lead to remote code execution in the context of the user using the vulnerable server.
Strike Apache httpd mod_lua req_parsebody Denial of Service	CWE: 665 CVE: 2022-22719	This strike exploits a denial of service vulnerability in Apache httpd. The vulnerability is due to use of uninitialized memory when processing a request. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could lead to crash of the server and with extended exploitation may lead to denial of service conditions.
Strike SalesAgility SuiteCRM email_recipients Remote Code Execution Vulnerability	CVE: 2022-23940	This strike exploits a remote code execution vulnerability in SalesAgility SuiteCRM. The vulnerability is located in the improper input validation of the "email_recipients" parameter within HTTP POST requests. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary code on the target server.
Strike Apache APISIX batch-requests Plugin IP address Restriction Bypass	CWE: 290 CVE: 2022-24112	This strike exploits an authentication weakness vulnerability in Apache APISIX. The vulnerability is due to inefficient validation of client requests at the vulnerable API endpoint "/apisix/admin/batch-requests". A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the vulnerable server if the batch-requests plugin is enabled and it is using the default API key of the administrator. Successful exploitation could lead to arbitrary code execution under the security context of the server process. *NOTE: While running this strike in OneArm mode, it creates a new endpoint/route "/poc/testing" which is visited to execute a command to create a file called "poc" under the "/tmp" directory on the server.
Strike MyBB Admin Control Panel Code Injection Vulnerability	CVE: 2022-24734	This strike targets a code injection vulnerability in the MyBB Admin Control Panel. The issue arises from improper input validation when processing user-supplied data in the settings management functionality. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary PHP code on the server with the privileges of the web application.
Strike TerraMaster TOS Unauthenticated Remote Code Execution	CWE: 74 CVE: 2022-24989	This strike exploits an unauthenticated command injection vulnerability in TerraMaster TOS. The vulnerability is due to the improper sanitization of the user input used in the popen function of the createRaid function. The vulnerability when chained with CVE-2022-24990 allows a remote unauthenticated attacker to execute arbitrary code as root through the raidtype and diskstring parameters during PHP Object Instantiation at the api.php?mobile/createRaid endpoint. Successful exploitation could result in arbitrary code execution under the security context of the user running the vulnerable application with root privileges.

Name	References	Description
Strike TerraMaster TOS Sensitive Information Leak Vulnerability	CWE: 306 CVE: 2022-24990	This strike exploits a sensitive information leak vulnerability in TerraMaster TOS. The vulnerability arises due to webNasIPS function in TerraMaster NAS devices which skips authentication checks. Attackers can exploit this vulnerability to obtain sensitive information like the admin password hash without authentication. The vulnerability when chained with CVE-2022-24989 allows a remote unauthenticated attacker to execute arbitrary code as root. Successful exploitation could result in information disclosure and in the worst case it could lead to remote code execution under the security context of the target server.
Strike Delta Industrial Automation DIAEnergie Arbitrary File Upload Vulnerability cve_2022_25347	CVE: 2022-25347	This strike exploits an arbitrary file upload vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability resides in the HandlerPage_KID endpoint, where insufficient input validation is performed on the HtmlId parameter and file extensions during file upload processing. A remote, unauthenticated attacker could leverage this flaw to upload malicious files to arbitrary locations on the server, potentially leading to the execution of arbitrary code within the web server's context.
Strike Open-Falcon Falcon-Plus SQL Injection in GetHostsFromGroup Function	CVE: 2022-26245	This strike exploits a SQL injection vulnerability in Open-Falcon Falcon-Plus. The vulnerability exists due to improper sanitization of user input in the /proc/group API endpoint. A remote attacker could leverage this flaw by sending a specially crafted request, leading to arbitrary SQL query execution on the database.
Strike dotCMS processFile Directory Traversal	CWE: 22 CVE: 2022-26352	This strike exploits a Directory Traversal vulnerability in dotCMS. The vulnerability is due to insufficient validation of the names of files uploaded through the dotCMS content API. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in writing a file outside of the expected document root, possibly leading to, in the worst case, arbitrary code execution under the security context of the web server process. *NOTE: While running this strike in OneArm mode, a file named "poc.jsp" is created on the server.
Strike Delta Industrial Automation DIAEnergie SQL Injection Vulnerability in DIAE_loopmapHandler.ashx	CVE: 2022-26887	This strike exploits an SQL injection vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability resides in the insufficient input validation of the "kid" parameter in HTTP requests to the DIAE_loopmapHandler.ashx endpoint. A remote, unauthenticated attacker could exploit this vulnerability by sending specially crafted requests, leading to the execution of arbitrary SQL commands with the privileges of NT SERVICE\MSSQLSERVER.
Strike Studio-42 elFinder Unrestricted File Upload Vulnerability	CVE: 2022-27115	This strike exploits an unrestricted file upload vulnerability in Studio-42 elFinder. The vulnerability resides in the improper validation of filenames during file uploads via the connector.minimal.php endpoint on Windows systems. Exploiting this vulnerability allows a remote, unauthenticated attacker to upload files with restricted extensions or malicious content, potentially leading to remote code execution.

Name	References	Description
Strike QNAP Photo Station Externally Controlled Reference Vulnerability	CWE: 610 CVE: 2022-27593	This strike exploits an externally controlled reference to a resource vulnerability in QNAP NAS devices running Photo Station. The vulnerability arises from an anomaly in PHP's fopen function, enabling an attacker to manipulate the 'g' parameter to traverse outside the intended cache directory and write cached files to arbitrary locations. Successful exploitation of this vulnerability would enable an attacker to modify system files. A remote, unauthenticated attacker could potentially fill up storage areas or exhaust other critical resources on the NAS, leading to denial of service for legitimate users or services dependent on those resources.
Strike Zoho ManageEngine OpManager SQL Injection in Inventory Reports	CVE: 2022-27908	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the Inventory Reports module due to insufficient validation of HTTP request parameters. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL queries, potentially compromising the underlying database.
Strike Zimbra Collaboration MailboxImportServlet Authenticated Directory Traversal	CWE: 22 CVE: 2022-27925	This strike exploits an authenticated directory traversal vulnerability in Zimbra Collaboration. The vulnerability is due to improper validation of zip files uploaded to the MailboxImportServlet. A remote, authenticated attacker could exploit this vulnerability by uploading a crafted zip file to the target server. Successful exploitation could result in the attacker writing files outside of the expected document root, in the worst case, leading to arbitrary code execution under the security context of the server process.
Strike SolarView Compact Command Injection	CWE: 78 CVE: 2022-29303	This strike exploits a command injection vulnerability in SolarView Compact. This vulnerability lies in the conf_mail.php component of the SolarView application. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted post request to the target server. Successful exploitation of this vulnerability could lead to remote code execution.
Strike WSO2 API Manager Directory Traversal	CWE: 434 CVE: 2022-29464	This strike exploits a directory traversal vulnerability in WSO2 API Manager. The vulnerability is due to improper sanitization for the multipart form field name for the file upload route. A remote, unauthenticated attacker could exploit the vulnerability by sending crafted HTTP requests to a target server. Successful exploitation can result in arbitrary file write in the context of the wso2carbon user.
Strike Lansweeper HelpdeskActions.aspx Directory Traversal Vulnerability	CVE: 2022-29517	This strike exploits a directory traversal vulnerability in Lansweeper. The vulnerability exists due to insufficient sanitization of the inline attachment file names when editing templates. A remote, authenticated attacker could leverage this flaw to write arbitrary files to the target system, potentially leading to denial of service or other malicious outcomes.
Strike WWBN AVideo unzipDirectory Directory Traversal Vulnerability	CVE: 2022-30547	This strike exploits a directory traversal vulnerability in WWBN AVideo. The vulnerability resides in the unzipDirectory function within the objects/functions.php file, which fails to properly sanitize file names during ZIP file extraction. A remote, authenticated attacker could leverage this flaw by uploading a crafted ZIP file, enabling arbitrary file writes and potential code execution within the web server's security context.

Name	References	Description
Strike Lansweeper AssetActions.aspx Directory Traversal Vulnerability	CVE: 2022-32573	This strike exploits a directory traversal vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of the "txtdocname" parameter when processing file uploads. Exploiting this flaw allows a remote, authenticated attacker to perform arbitrary file writes on the target system, potentially leading to denial of service or other malicious outcomes.
Strike ZK Framework Authentication Bypass	CWE: 200 CVE: 2022-36537	This strike exploits an authentication bypass vulnerability in ZK Java Framework. The vulnerability is due to lack of authentication in ZK AuUploader servlet. A remote unauthenticated attacker can exploit this vulnerability sending a crafted request to the victim server which leads to the disclosure of sensitive files in the context of the webroot.
Strike Zimbra Collaboration MailboxImportServlet Authentication Bypass	CWE: 22 CVE: 2022-37042	This strike exploits an authentication bypass vulnerability in Zimbra Collaboration. The vulnerability is due to improper validation of zip files uploaded to the MailboxImportServlet. A remote, unauthenticated attacker could exploit this vulnerability by uploading a crafted zip file to the target server. Successful exploitation could result in the attacker writing files outside of the expected document root, in the worst case, leading to arbitrary code execution under the security context of the server process.
Strike Adobe ColdFusion Directory Traversal and Arbitrary Code Execution Vulnerability	CVE: 2022-38421	This strike exploits a directory traversal vulnerability in Adobe ColdFusion. The vulnerability exists due to improper input validation when processing HTTP parameters in the copydirectory.cfm script. A remote, authenticated attacker could leverage this flaw to execute arbitrary code with SYSTEM privileges on the target server.
Strike Apache Airflow DAG run_id Command Injection	CWE: 94 CVE: 2022-40127	This strike exploits a command injection vulnerability in Apache Airflow. This vulnerability is due to improper input validation for parameter run_id for directed acyclic graphs or DAGs. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in command execution in the context of the user running the server. *NOTE : In one-arm mode, the strike uses airflow/ airflow to login and uses example_bash_operator DAG for exploitation which results in /tmp/Test file being created.
Strike Dolibarr ERP and CRM Code Injection Vulnerability in edit.php	CVE: 2022-40871	This strike exploits a code injection vulnerability in Dolibarr ERP and CRM. The vulnerability resides in the insufficient sanitization of parameters in HTTP POST requests to the edit.php endpoint. Successful exploitation allows a remote attacker to execute arbitrary PHP code on the target server, potentially leading to remote code execution.
Strike Microsoft Exchange Server Server-Side Request Forgery Vulnerability	CWE: 918 CVE: 2022-41040	This strike exploits a server-side request forgery vulnerability in Microsoft Exchange Server. The vulnerability is due to insufficient handling of requests to the autodiscover component of Exchange. An authenticated, remote attacker can exploit this vulnerability by sending a crafted request to the vulnerable Exchange server. Successful exploitation results in requests being made to backend servers. *NOTE: This strike sends a request to /mapi/nsipi/ or ews/exchange.asmx which are inaccessible by default. In one-arm mode we use the authorization Administrator:Password1

Name	References	Description
Strike Centreon Web Poller Resource SQL Injection Vulnerability	CVE: 2022-41142	This strike exploits a SQL injection vulnerability in the Centreon Web Poller Resource module. The vulnerability exists due to insufficient input validation of the `resource_activate[resource_activate]` parameter in the `insertResource` function. A remote, authenticated attacker could leverage this flaw by sending a specially crafted HTTP request, potentially leading to arbitrary SQL command execution on the target database.
Strike Centreon Web formContactGroup.php SQL Injection Vulnerability	CVE: 2022-42427	This strike exploits an SQL injection vulnerability in the Centreon Web application. The vulnerability exists due to improper validation of the `cg_id` parameter in the `formContactGroup.php` script. A remote, authenticated attacker could leverage this flaw by sending a specially crafted HTTP request, potentially leading to the execution of arbitrary SQL commands on the database.
Strike Zoho ManageEngine Password Manager Pro UserGroupListTable Controller SQL Injection	CWE: 89 CVE: 2022-43672	The strike exploits an SQL injection vulnerability in Zoho ManageEngine Password Manager Pro and related products. The vulnerability is due to improper validation of actionType parameter in the UserGroupListTableController class. A remote attacker can exploit the vulnerability by sending a crafted request to the target server. Successful exploitation could lead to arbitrary SQL code execution in the security context of database service, which runs as SYSTEM.
Strike Atlassian Bitbucket Server and Data Center Command Injection Vulnerability	CWE: 77 CVE: 2022-43781	This strike exploits a command injection vulnerability in Atlassian Bitbucket Server and Data Center. The vulnerability is due to improper validation of usernames on the server. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in arbitrary command execution in the security context of the user running the vulnerable application. *NOTE: While running this strike in OneArm mode, a file /tmp/poc is created on the server.
Strike TP-Link Archer AX21 Country Command Injection	CVE: 2023-1389 CWE: 77	This strike exploits a command injection vulnerability in TP-Link Archer AX21. The vulnerability is due to the improper sanitization of the country parameter. A remote, unauthenticated attacker could exploit this vulnerability by injecting the commands into the country parameter. Execution requires sending the request twice, the first request sets the command in the country value, and the second request executes it. Successful exploitation could allow an attacker to achieve remote code execution with root privileges.
Strike Sophos Web Appliance Command Injection Vulnerability	CWE: 77 CVE: 2023-1671	This strike exploits a pre-auth command injection vulnerability in the warn-proceed handler of the Sophos Web Appliance. The vulnerability arises due to improper sanitization of user-provided input. It allows a remote, unauthenticated attacker to inject commands through the data field by escaping commands with a single quote. Successful exploitation could result in arbitrary code execution under the security context of the user running the vulnerable application.

Name	References	Description
Strike WordPress Limit Login Attempts Plugin Stored Cross Site Scripting	CWE: 79 CVE: 2023-1861	A stored cross-site scripting vulnerability has been discovered in WordPress Limit Login Attempts Plugin. The vulnerability is due to improper input validation of the cookie value. A remote, unauthenticated attacker could exploit this vulnerability by sending requests with crafted cookie to the target system. Successful exploitation could result in stored cross-site scripting. The vendor has released a patch to address this vulnerability in plugin version 1.7.2.
Strike Cisco IOS XE WebUI Authentication Bypass	CWE: 284 CVE: 2023-20198	This strike exploits an authentication bypass vulnerability in the WebUI component of Cisco IOS XE. This vulnerability is due to improper configuration of the nginx reverse proxy server. A remote, unauthenticated attacker can exploit this vulnerability to bypass authentication by accessing an internal endpoint. Successful exploitation results in the ability to issue privilege commands, including to create a new local user.
Strike Cisco IOS XE WebUI Command Injection	CWE: 78 CVE: 2023-20273	This strike exploits a command injection vulnerability in the WebUI component of Cisco IOS XE. This vulnerability is due to insufficient validation of IPv6 addresses supplied when performing a software upgrade. A remote, authenticated attacker can exploit this vulnerability by sending crafted HTTP requests to the target server. Successful exploitation results in the execution of arbitrary OS commands with the privileges of root.
Strike Vmware Aria Operations for Networks resttosaasservlet Command Injection Vulnerability	CWE: 77 CVE: 2023-20887	This strike exploits a command injection vulnerability in Vmware Aria Operations for Networks. The vulnerability is due to improper input handling in API requests and an Nginx misconfiguration that allows access to the restricted internal API endpoint /resttosaasservlet. A remote, unauthenticated attacker can exploit this vulnerability by sending specially crafted requests, bypassing the Nginx reverse proxy configuration. Successful exploitation can lead to the execution of arbitrary commands on the underlying operating system with root privileges, potentially resulting in full system compromise.
Strike VMWare Aria Operations for Networks saveFileToDisk Directory Traversal Vulnerability	CWE: 22 CVE: 2023-20890	This strike exploits a directory traversal vulnerability in VMWare Aria Operations for Networks. The vulnerability is due to improper validation of file names when uploading files to the appliance. The filename parameter from the multipart request is not sanitized before it is used to create a path to the file. A remote, authenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation will allow an attacker to write files outside of the expected temp directories. In the worst case, this could be leveraged to achieve arbitrary code execution under the security context of the root user.

Name	References	Description
Strike Wordpress WpForo Plugin LFI SSRF Deserialization	CWE: 98 CVE: 2023-2249	This strike exploits a File Inclusion and Server Side Request Forgery (SSRF) vulnerability in wpforo plugin of wordpress. This vulnerability is due to lack of input validation for the image_blob parameter which is passed to the php get_file_contents method call. A remote, authenticated low-privileged attacker could exploit this vulnerability by sending a crafted request to the target wordpress server. A successful attack may result in local file inclusion, server side request forgery or insecure deserialization in the server. *NOTE: In one-arm, the strike attempts to login with the creds - 'victimtest/1234' and attempts to fetch the contents of /etc/passwd or reach an internal endpoint at 'http://10.39.44.149:4445/secret' depending on the variant being ran.
Strike Atlassian Confluence Data Center and Server Setup Action Privilege Escalation	CWE: 863 CVE: 2023-22515	This strike exploits a privilege escalation vulnerability in Atlassian Confluence Data Center and Server. The vulnerability is attributed to a weakness in access control within the setup actions component. Its root cause lies in the attacker's ability to execute complex getter/setter chains on the Action object for unauthenticated endpoints, allowing manipulation of crucial properties. Through the modification of the setupComplete variable, the attacker successfully exploited the setup functionality, resulting in the creation of a new administrator user. An unauthenticated, remote attacker could leverage this vulnerability by sending meticulously crafted requests to the setup endpoint. Successful exploitation could lead to the execution of arbitrary code within the security context of the newly created administrator user.
Strike Atlassian Confluence Data Center and Server Improper Authorization	CWE: 863 CVE: 2023-22518	This strike exploits an improper authorization vulnerability in Atlassian Confluence Data Center and Server. The vulnerability arises from the absence of authentication for legacy endpoints associated with the application restore feature, specifically the "/json/setup-restore.action" endpoint. Given the lack of authentication requirements for accessing this endpoint, a malicious actor could exploit this vulnerability to delete all data in a Confluence installation and replace it with data under their control. A remote, unauthenticated attacker could leverage this vulnerability by sending carefully crafted requests to the target server. If successfully exploited, this could lead to privilege escalation and the potential execution of arbitrary code on the targeted system.
Strike Atlassian Confluence Data Center and Server Template Injection	CWE: 74 CVE: 2023-22527	This strike exploits a template injection vulnerability in Atlassian Confluence Data Center and Server. The vulnerability is due to improper validation of user data sent to the sever. The label parameter is not properly escaped before use in an OGNL expression. This allows arbitrary OGNL expression evaluation. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary code execution under the security context of the user running the vulnerable application. *NOTE: While running the strike in one-arm mode, a file gets created in the /tmp directory of the vulnerable server.

Name	References	Description
Strike Zoho ManageEngine SupportCenter Plus Command Injection via Custom Schedules Executor	CVE: 2023-23076	This strike exploits a command injection vulnerability in Zoho ManageEngine SupportCenter Plus. The vulnerability exists due to insufficient validation of the "executor" parameter in the custom schedule settings. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to arbitrary command execution with SYSTEM privileges.
Strike Joomla CMS Webservice Authentication Bypass	CWE: 284 CVE: 2023-23752	This strike exploits an authentication bypass vulnerability in Joomla CMS. The vulnerability is due to inadequate sanitization of request parameters when processing API requests. If the request includes a 'public' parameter its value will overwrite the route default variable, and unauthenticated access may be granted to private API routes. An unauthenticated remote attacker can manipulate request parameters, leading to potential unauthorized access to private API routes that require authentication. Successful exploitation could result in sensitive information disclosure, including Joomla database credentials. Attackers could leverage this information to gain unauthorized access, modify user passwords, or perform brute-force attacks on user accounts. *Note: Running this strike in one-arm mode reveals the database credentials and other sensitive information.
Strike D-Link DIR-820 Router ping ccp OS Command Injection	CVE: 2023-25280 CWE: 78	This strike exploits an OS command injection vulnerability in D-Link DIR-820 Router. The vulnerability is due to improper sanitization of ping_addr parameter used in ping ccp endpoint. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted payload to the ping_addr parameter. Successful exploitation could result in remote code execution on the affected device and potential escalation of privileges to root.
Strike Ruckus Wireless Admin Unauthenticated RCE	CWE: 94 CVE: 2023-25717	This strike exploits a remote code execution vulnerability in Ruckus Wireless routers. The vulnerability is due to insufficient input validation in the '/forms/doLogin' endpoint of the admin web page. A remote unauthenticated attacker can exploit this vulnerability by sending crafted requests to the victim router which results in remote code execution.
Strike PaperCut MF and NG SetupCompleted formSubmit Authentication Bypass	CVE: 2023-27350 CWE: 284	This strike exploits an authentication bypass vulnerability in PaperCut MF/NG. The vulnerability is due to improper access and authentication control in "SetupCompleted" class. A remote, unauthenticated attacker could exploit the vulnerability by sending a request to the "/app" endpoint on the target server. Successful exploitation could result in authentication bypass and, in the worst case, arbitrary code execution on the server under the security context of SYSTEM. *NOTE - While running this strike in OneArm mode, windows calculator application runs on the target server.
Strike Zoho ManageEngine ADSelfService Plus Mobile App Authentication API Denial of Service	CWE: 476 CVE: 2023-28342	This strike exploits an authentication bypass vulnerability in Zoho ManageEngine ADSelfService Plus. The vulnerability is due to improper input validation in the Mobile App Authentication API. A remote, unauthenticated attacker could send a crafted request to the authentication endpoint without a password parameter. When the target server processes the request, it will pass the null password value to a native function resulting in an access violation and subsequently terminating and restarting the server process. Successfull exploitation could result in denial of service.

Name	References	Description
Strike Contec CONPROSYS HMI System SQL Injection Vulnerability	CVE: 2023-29154 CWE: 89	This strike exploits an SQL injection vulnerability in Contec CONPROSYS HMI System. The vulnerability is due to insufficient sanitization of user data used in query_getTableCol.php. The query retrieves the metadata of the database table. However, the code fails to check for SQL injection characters in the JSON parameter of the table. As a result, a remote, authenticated attacker could exploit this vulnerability by sending a specially crafted request to the target server. A successful attack may allow the execution of arbitrary SQL commands against the database on the target server.
Strike Ghost CMS static-theme.js Directory Traversal Vulnerability	CVE: 2023-32235	This strike exploits a directory traversal vulnerability in Ghost CMS. The vulnerability resides in the static-theme.js component, where user-supplied paths are improperly validated. A remote attacker could leverage this flaw to access sensitive files on the server, potentially exposing confidential information.
Strike Ignite Realtime Openfire Path Traversal Vulnerability	CWE: 22 CVE: 2023-32315	This strike exploits a path traversal vulnerability in Ignite Realtime Openfire. This vulnerability is due to the improper handling of UTF-16 encoded characters in URLs. It allows an unauthenticated user to use an already configured Openfire environment to access restricted pages in the Admin Console reserved for administrative users. This vulnerability can be used to create a new admin user, which can then be used to upload a Openfire management plugin weaponized with a Java native payload that triggers an RCE. Successful exploitation could result in authentication bypass and remote code execution through access to the restricted Admin Console pages. *NOTE: While running the strike in one-arm mode, the CSRF token can be retrieved from the response, which can be further used to create a new admin user account.
Strike Jenkins Sidebar Link Plugin icon Directory Traversal Vulnerability	CVE: 2023-32985 CWE: 22	This strike exploits a directory traversal vulnerability in Jenkins Sidebar Link Plugin. This vulnerability is due to a directory traversal when handling link icons. The vulnerability exists when the function SidebarLinkPlugin.doCheckLinkIcon() is called, the value of the parameter value or the path that is created is never sanitized or normalized of directory traversal related characters. A remote, authenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in information disclosure. *NOTE: While running this strike in OneArm mode, the existence of the file "/etc/passwd" on the target server is checked. The credentials used are as follows: the username is "jenkins_user" and the password is "jenkins".
Strike Zimbra Webmail Draftid Cross-Site Scripting	CWE: 79 CVE: 2023-34192	This strike exploits a cross-site scripting vulnerability in the web component of Zimbra Collaboration Suite. The vulnerability is due to improper input sanitization. A remote authenticated attacker could exploit this vulnerability by sending a crafted request to the target system. Successful exploitation could result in execution of script code in the security context of the target user's browser.

Name	References	Description
Strike Google Chrome V8 Engine JSStackCheck Type Confusion	CWE: 843 CVE: 2023-3420	This strike exploits a type confusion vulnerability in the V8 JavaScript engine of Google Chrome. The vulnerability is due to incorrect side effect modelling of JSStackCheck. A remote attacker could exploit this vulnerability by enticing a user into opening a crafted HTML page. Successful exploitation could result in execution of arbitrary code in the context of the Google Chrome sandbox.
Strike Ivanti Endpoint Manager Mobile (EPMM) and MobileIron Core Authentication Bypass	CWE: 287 CVE: 2023-35082	This strike exploits an authentication bypass vulnerability in Ivanti Endpoint Manager Mobile. The vulnerability is due to a logic flaw and allows a remote unauthenticated attacker to access API endpoints on exposed management servers or resources without proper authentication. This access grants them the ability to execute various operations, potentially compromising sensitive information or modifying platform configurations.
Strike Ivanti MobileIron Sentry uploadFileUsingFile Input Authentication Bypass Vulnerability	CWE: 863 CVE: 2023-38035	This strike exploits an authentication bypass vulnerability in MICS Admin Portal in Ivanti MobileIron Sentry. A remote, unauthenticated attacker can bypass authentication controls on the administrative interface due to an insufficiently restrictive Apache HTTPD configuration. Successful exploitation of this vulnerability could allow an attacker to bypass authentication and gain unauthorized access to the system.
Strike Adobe ColdFusion Deserialization of Untrusted Data Vulnerability	CWE: 502 CVE: 2023-38203	This strike exploits an insecure deserialization vulnerability in Adobe ColdFusion. The vulnerability is due to inadequate filtering of Java class paths during the deserialization process, allowing remote, unauthenticated attackers to send maliciously crafted serialized objects. These objects can lead to arbitrary code execution within the application. ColdFusion uses a denylist to prevent certain classes from being deserialized, however, the class com.sun.rowset.JdbcRowSetImpl was not blocked, which attackers exploited. Successful exploitation of this vulnerability allows attackers to execute arbitrary code on the affected system.
Strike Adobe ColdFusion IPFilterUtils Improper Access Control CVE 2023-38205	CWE: 284 CVE: 2023-38205	This strike exploits an improper access control vulnerability in Adobe ColdFusion. The vulnerability is due to improper validation of the URL path by the IPFilterUtils class which was supposed to block access to sensitive endpoints if accessed from an IP address not from the allow list. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests with extra characters to the target server. Successful exploitation could result in access to the ColdFusion Administrator endpoints.
Strike Qlik Sense Path Traversal	CWE: 22 CVE: 2023-41266	This strike exploits a path traversal vulnerability in Qlik sense. A remote, unauthenticated attacker can exploit this by creating an anonymous session and sending maliciously crafted HTTP requests. Successful exploitation could allow the attacker to send further requests to unauthorized endpoints.
Strike Netgate pfSense Command Injection in GIF-GRE Interface Configuration	CVE: 2023-42326	This strike exploits a command injection vulnerability in Netgate pfSense. The vulnerability resides in the improper input validation of parameters in the interfaces_gif_edit.php and interfaces_gre_edit.php files. A remote, authenticated attacker could leverage this flaw by sending specially crafted HTTP POST requests, leading to the execution of arbitrary commands with root privileges.

Name	References	Description
Strike JetBrains TeamCity XML-RPC Authentication Bypass Vulnerability	CWE: 288 CVE: 2023-42793	This strike exploits an authentication bypass vulnerability in JetBrains TeamCity. The vulnerability is due to improper handling of requests using XML-RPC with the "/RPC2" suffix in the Request-URI, which bypasses authentication. Exploiting this vulnerability enables attackers to gain administrator-level access by sending crafted requests to the target server. With elevated privileges, attackers can execute arbitrary commands under the security context of the target server. *Note : While running the strike in one-arm mode, it creates a file /tmp/test on the target server.
Strike Nextgen Mirth Connect XStreamSerializer Insecure Deserialization Vulnerability	CWE: 502 CVE: 2023-43208	This strike exploits an insecure deserialization vulnerability in Nextgen Mirth Connect. This vulnerability is due to improper input validation of XML request body data. The vulnerability exploits the insecure usage of the Java XStream library to unmarshal XML payloads. This improper handling allows attackers to craft malicious XML payloads that can bypass security checks and execute code on the server. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in remote code execution in the security context of SYSTEM. *NOTE : While running the strike as one-arm, the file /tmp/test gets created on the target server.
Strike Ivanti Avalanche FileStoreConfig Arbitrary FileUpload Vulnerability	CVE: 2023-46263 CWE: 434	This strike exploits an arbitrary file upload vulnerability in Ivanti Avalanche. The vulnerability is due to inadequate validation of the txtUncPath field in the Central FileStore configuration settings. A remote authenticated attacker can exploit this by setting the file storage path to target unauthorized directories, specifically the RemoteControl server's webroot. The insufficient checks allow the attacker to bypass blacklist restrictions, enabling malicious files to be uploaded and executed as SYSTEM on the server. Successful exploitation of this vulnerability could lead to remote code execution in the context of the user using the vulnerable server.
Strike Ivanti Connect Secure and Policy Secure Gateways Authentication Bypass	CWE: 287 CVE: 2023-46805	This strike exploits an authentication bypass vulnerability has been reported in Ivanti Connect Secure (formerly Pulse Secure) and Ivanti Policy Secure Gateways. This vulnerability is do to insufficient validation of HTTP request paths in the web process. A remote, unauthenticated attacker can exploit this vulnerability by using one of the Request-URI prefixes and pivoting to a second endpoint. Successful exploitation could result in unauthenticated access to some authenticated REST API endpoints.
Strike QNAP VioStor NVR OS command injection	CWE: 78 CVE: 2023-47565	This strike exploits an OS command injection vulnerability in QNAP VioStor NVR models running QVR Firmware 4.x. The vulnerability is due to improper validation of user-supplied data. A remote, authenticated attacker can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation could result in remote code execution in the context of the running sever.

Name	References	Description
Strike Apache OFBiz XMLRPC Insecure Deserialization CVE 2023-49070	CWE: 94 CVE: 2023-49070	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. This vulnerability is due to the unmaintained XML-RPC library which deserializes user data. A remote, unauthenticated attacker could exploit this vulnerability by sending a request to the server with an encoded or unnormalized request URI to the "xmlrpc" endpoint, an empty USERNAME or PASSWORD parameter with a parameter requirePasswordChange with a value of Y, and a crafted Java object in a serializable XML element. Successfully exploiting this vulnerability could result in remote code execution in the security context of the user running the OFBiz server.
Strike ownCloud Graph API Information Disclosure Vulnerability	CWE: 22 CVE: 2023-49103	This strike exploits an information disclosure vulnerability in the ownCloud Graph API extension. The vulnerability exists because the affected versions rely on a third-party GetPhpInfo.php library that exposes the secrets stored in environment variables. This flaw allows attackers to steal sensitive information like admin passwords, mail server credentials, and license keys. A remote attacker could exploit the vulnerability by sending a crafted request to the target service. Successful exploitation could result in the disclosure of sensitive information.
Strike Apache Struts HttpParameters.java Unrestricted File Upload	CWE: 552 CVE: 2023-50164	This strike exploits a directory traversal vulnerability in Apache Struts framework. The vulnerability is due to insufficient validation of HTTP parameters during file uploads to the "upload.action" endpoint, resulting in unrestricted file uploads. The vulnerability allows an attacker to manipulate file upload parameters to enable path traversal and upload a malicious file to the target server leading to remote code execution, gaining full system control. *NOTE: While running the strike in one-arm mode, poc.txt file gets created in the /tmp directory of the vulnerable server.
Strike Apache OFBiz Authentication Bypass	CWE: 918 CVE: 2023-51467	This strike exploits an authentication bypass vulnerability in Apache OFBiz. This vulnerability is due to improper input validation of the credentials by the checkLogin function. A remote, unauthenticated attacker could exploit this vulnerability by sending a request with null or invalid username and password parameters and the requirePasswordChange parameter as Y to the server. Successfully exploiting this vulnerability could result in remote code execution in the security context of the web server running the vulnerable application.
Strike Apache Kafka Groovy Script Remote Code Execution	CWE: 94 CVE: 2023-52251	This strike exploits a command injection vulnerability in the web component of Apache Kafka. The vulnerability is due to unrestricted Groovy script execution within the smart filter functionality. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request and might result in arbitrary command execution under the security context of the kafkaui user.
Strike WordPress Backup Migration Plugin Remote Code Execution Vulnerability	CVE: 2023-6553	This strike exploits a remote code execution vulnerability in the WordPress Backup Migration plugin. The vulnerability arises from improper input validation in the backup-heart.php script. A remote, unauthenticated attacker could leverage this flaw by sending a specially crafted HTTP POST request, potentially leading to the execution of arbitrary PHP code on the target server.

Name	References	Description
Strike MLflow get-artifact Local File Read Vulnerability	CWE: 29 CVE: 2023-6909	This strike exploits a Local File Inclusion (LFI) vulnerability in the MLflow framework, which is hosted in the GitHub repository mlflow/mlflow. MLflow is a platform designed to streamline machine learning development, including tracking experiments, packaging code into reproducible runs, and sharing and deploying models. The vulnerability arises from improper handling of URL paths containing directory traversal characters when associating runs with experiments, allowing remote unauthenticated attackers to read arbitrary files on the server. The issue arises from a URI parsing confusion, which allows attackers to manipulate the artifact_location parameter during the creation of an experiment. This can lead to the unintended inclusion of sensitive files like /etc/passwd. Successful exploitation could result in the disclosure of sensitive information.
Strike Palo Alto Networks PAN-OS Management Interface Authentication Bypass	CWE: 306 CVE: 2024-0012	This strike exploits a Authentication Bypass vulnerability in Palo Alto Networks PAN-OS. The vulnerability is due to missing authentication to a critical path. A remote, unauthenticated attacker can exploit by sending a crafted HTTP request to the management web interface. Successful exploitation could result in information disclosure.
Strike Centreon Web updateDirectory SQL Injection Vulnerability	CVE: 2024-0637	This strike exploits an SQL injection vulnerability in the Centreon Web module. The vulnerability exists due to improper input validation in the updateDirectory function when processing the dir_id parameter. A remote, authenticated attacker could leverage this flaw by sending a specially crafted request, leading to arbitrary SQL command execution on the target database.
Strike Atlassian Confluence Data Center and Server addlanguage Remote Code Execution	CWE: 94 CVE: 2024-21683	This strike exploits a remote code execution vulnerability in the Confluence Data Center and Server. The vulnerability is due to insufficient input validation in the function that allows users to add new code block macro language definitions. This flaw allows an authenticated attacker to inject and execute arbitrary Java code by uploading a malicious language file. A remote, authenticated attacker could leverage this vulnerability to inject Java code, resulting in arbitrary code execution under the security context of the user running the vulnerable application. *Note : While running the strike in one-arm mode, it creates a file /tmp/test on the target server.
Strike Ivanti Connect Secure and Policy Secure Gateways Command Injection	CWE: 77 CVE: 2024-21887	This strike exploits a command injection vulnerability in the web components of Ivanti Connect Secure and Ivanti Policy Secure Gateways. This vulnerability is due to the insufficient validation of HTTP arguments. In the web application, two different paths are susceptible to system command injection. The user-submitted data is directly employed in the Python Popen function without undergoing any sanitization. Consequently, an attacker can inject ";command;" and execute shell commands. A remote authenticated attacker could exploit this vulnerability by sending a crafted request to a target server. Successful exploitation could result in arbitrary shell command execution under the security context of the root user.

Name	References	Description
Strike Ivanti Connect Secure, Policy Secure, and Neurons Server-Side Request Forgery Vulnerability	CWE: 918 CVE: 2024-21893	This strike exploits a Server Side Request Forgery (SSRF) vulnerability in the SAML component of Ivanti Connect Secure, Ivanti Policy Secure, and Ivanti Neurons. The vulnerability arises from insufficient validation of XML content processed by the SAML server, which utilizes an outdated xmltooling library. The URI attribute of the RetrievalMethod element of the XML SOAP allows requests for remote resources via an HTTP GET request, leading to SSRF attacks. A remote, unauthenticated attacker could exploit this vulnerability to access restricted resources. This vulnerability when chained with CVE-2024-21887 may lead to remote code execution.
Strike Centreon Web updateLCARelation SQL Injection Vulnerability	CVE: 2024-23116	This strike exploits an SQL injection vulnerability in the Centreon Web module. The vulnerability exists due to insufficient input validation in the updateLCARelation function when processing the acl_r_topos parameter. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL commands on the target server's database.
Strike Centreon Web updateContactServiceCommands SQL Injection Vulnerability	CVE: 2024-23117	This strike exploits an SQL injection vulnerability in the Centreon Web module. The vulnerability exists due to insufficient input validation in the updateContactServiceCommands function when processing the contact_svNotifCmds[] parameter. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary SQL commands on the target database, potentially compromising its integrity and security.
Strike Windows CreateProcess cmd.exe Command Injection Vulnerability	CWE: 78 CVE: 2024-24576 CVE: 2024-1874 CVE: 2024-3566	This strike exploits a command injection vulnerability in Windows. The vulnerability arises from improper escaping of arguments when invoking batch files ('bat' and 'cmd' extensions) by the standard libraries across various programming languages. As a result, the Windows command shell (cmd.exe) can be manipulated into executing malicious code. Multiple CVEs are tied to this vulnerability (CVE-2024-24576, CVE-2024-3566, CVE-2024-1874, CVE-2024-22423), however, they all exploit the same underlying weakness. A remote, unauthenticated attacker could exploit this vulnerability by controlling the arguments passed to the spawned process. Successful exploitation could lead to the execution of arbitrary shell commands, bypassing the escaping mechanism, and operating within the security context of the target server.
Strike JetBrains TeamCity BaseController Authentication Bypass Vulnerability	CWE: 288 CVE: 2024-27198	This strike exploits an authentication bypass vulnerability in JetBrains TeamCity. The vulnerability is due to an authentication weakness in the BaseController class, which allows unauthenticated users to access restricted endpoints. It results from inadequate validation of parameters such as the "jsp" parameter and the ".jsp" extension in URLs. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in an attacker bypassing the server's authentication mechanisms, in the worst case, leading to remote code execution under the security context of the target server.

Name	References	Description
Strike Ivanti Endpoint Manager (EPM) xp_cmdshell SQL Injection Vulnerability	CWE: 89 CVE: 2024-29824	This strike exploits an SQL injection vulnerability in Ivanti Endpoint Manager (EPM). The vulnerability lies in the RecordGoodApp() function, where an unsanitized md5 value provided by the user is used in an SQL query. Attackers can exploit this by sending a crafted SOAP request, injecting SQL commands, such as xp_cmdshell, to execute malicious code. Successful exploitation of this vulnerability could allow an unauthenticated attacker within the same network to execute arbitrary code.
Strike D-Link nas_sharing Hardcoded Credentials	CVE: 2024-3272 CWE: 798	This strike exploits an authentication bypass vulnerability in D-Link NAS sharing. The vulnerability is due to the use of hardcoded credentials in nas_sharing. By sending a crafted request, an attacker can bypass authentication.
Strike Apache OFBiz Directory Traversal Vulnerability	CVE: 2024-36104	This strike exploits a directory traversal vulnerability in Apache OFBiz. The vulnerability exists due to improper validation of URL data when processing HTTP requests. A remote, unauthenticated attacker can leverage this flaw by sending specially crafted requests, potentially bypassing authentication or executing arbitrary OS commands on the affected server.
Strike Veertu Anka Build Directory Traversal Vulnerability	CVE: 2024-41163	This strike exploits a directory traversal vulnerability in Veertu Anka Build. The vulnerability exists due to insufficient validation of the "service" parameter in the archive API endpoint. A remote, unauthenticated attacker could leverage this flaw by sending a specially crafted request, enabling them to access and read arbitrary files from the target server.
Strike Mitel MiCollab Path Traversal Vulnerability	CWE: 22 CVE: 2024-41713	This strike exploits a path traversal vulnerability in Mitel MiCollab. A remote unauthenticated attacker can conduct a path traversal attack due to insufficient input validation. Successful exploitation could allow unauthorized access, and the ability to read arbitrary files on the server.
Strike Apache OFBiz Forced Browsing Vulnerability	CWE: 425 CVE: 2024-45195	This strike exploits a forced browsing vulnerability in Apache OFBiz. The vulnerability is due to improper access control in the web application. A remote attacker could exploit this vulnerability by sending a crafted HTTP POST request to the targeted server. Successful exploitation could result in unauthorized access to sensitive information.
Strike Aviatrix Controller OS Command Injection Vulnerability	CVE: 2024-50603 CWE: 78	This strike exploits an OS command injection vulnerability in Aviatrix Controller. The vulnerability allows unauthenticated remote attackers to inject shell metacharacters into the /v1/api endpoint via the cloud_type parameter in list_flightpath_destination_instances or the src_cloud_type parameter in flightpath_connection_test. Successful exploitation of the vulnerability allows remote attackers to execute arbitrary commands on the affected system.

Name	References	Description
Strike Cleo Harmony VLTrader Lexicom File Upload Vulnerability	CVE: 2024-50623 CWE: 434	This strike exploits a file upload vulnerability in Cleo Harmony, VLTrader, Lexicom. The vulnerability allows unauthenticated attackers to upload malicious files, which can then be exploited via directory traversal to execute arbitrary code. Successful exploitation of this vulnerability allows remote attackers to access sensitive information, modify data, or disrupt system operations.
Strike Apache Struts FileuploadIntercept or Unrestricted File Upload	CWE: 434 CVE: 2024-53677	This strike exploits a file upload vulnerability in Apache Struts 2 framework. The vulnerability lies in the File Upload Interceptor, which allows attackers to exploit improperly sanitized file names containing path traversal sequences. This can lead to arbitrary file writes, enabling remote code execution (RCE) in vulnerable applications. The exploitation involves manipulating field name capitalization in file upload forms to bypass Struts 2's parameter binding, allowing attackers to control internal variables like top.uploadFileName via the OGNL value stack. Exploitation is customized, requiring knowledge of the upload endpoint's structure.
Strike Ivanti Cloud Services Appliance OS Command Injection Vulnerability	CWE: 78 CVE: 2024-8190	This strike exploits an OS command injection vulnerability in the Ivanti Cloud Services Appliance, versions prior to 4.6 Patch 519. This vulnerability is due to improper validation of user data sent to the datetime php endpoint. Successful exploitation might result in arbitrary code execution in the context of the root user.
Strike Ivanti Cloud Services Appliance broker Authentication Bypass	CWE: 22 CVE: 2024-8963	This strike exploits Authentication Bypass vulnerability in Ivanti Cloud Services Appliance. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could allow an unauthorized attacker to access restricted functionality.
Strike Docker Daemon API Unauthorized Remote Code Execution		This strike exploits a remote code execution vulnerability in Docker daemon API. An attacker can start a docker container, attach host's /etc to the container and read/write files in etc.
Strike TOPSEC Firewall ELCO ELIGIBLECONTESTANT Remote Code Execution	EXPLOITDB : 40272	This strike emulates a remote code execution attack against TopSec Firewalls. This attack uploads and executes arbitrary code via an HTTP POST request to /cgi/maincgi.cgi. NOTE: By default the vulnerable services are accessed via SSL connection (port 443). A publicly available exploit for this vulnerability can be found in the reported leak of 0Day exploits from the NSA by a group known as the "Shadow Brokers", identified as ELIGIBLECONTESTANT
Strike TOPSEC Firewall ELCA ELIGIBLECANDIDATE Remote Code Execution	EXPLOITDB : 40273	This strike emulates a remote code execution attack against TopSec Firewalls. This attack uploads and executes arbitrary code via an HTTP POST request to /cgi/maincgi.cgi. NOTE: By default the vulnerable services are accessed via SSL connection (port 443). A publicly available exploit for this vulnerability can be found in the reported leak of 0Day exploits from the NSA by a group known as the "Shadow Brokers", identified as ELIGIBLECANDIDATE.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike WordPress Quizlord plugin Reflected Cross Site Scripting	EXPLOITDB : 45307	This strike exploits a reflected cross-site scripting vulnerability found in Quizlord WordPress plugin. This vulnerability is due to inadequate input filtering in the web interface, while parsing input passed to quiz title parameter. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike Firefox Hyphenated URL Exploit Variant 2	BID: 14784 CVE: 2005-2871	This strike exploits a flaw in the Firefox browser that is triggered by a hostname in a URL that is all hyphens.
Strike Adobe Flash 9-10 ASnative(15,0) NULL Pointer Dereference		This strike exploits a NULL pointer dereference in the Adobe Flash browser plugin. This flaw is triggered when the ASnative method is used to call function 15-0 with a string as the first parameter.
Strike Adobe Flash 9-10 ASnative(301,1) NULL Pointer Dereference		This strike exploits a NULL pointer dereference in the Adobe Flash browser plugin. This flaw is triggered when the ASnative method is used to call function 301-1 with less than two parameters.
Strike HP Intelligent Management Center Unauthenticated File Retrieval		This strike exploits a directory traversal vulnerability presents in the HP Intelligent Management Center. The vulnerability is due to insufficient validation of traverse directory requests. The remote attacker may disclosure the information in the target system.
Strike Headline Portal Engine page.newnews.show.php3 HPEinc Parameter PHP File Include	BID: 19663	This strike exploits a PHP include flaw in the Headline Portal Engine web application. An attacker could exploit this vulnerability to execute arbitrary server-side script code.
Strike Headline Portal Engine thememaker.php3 HPEinc Parameter PHP File Include Variant 2	BID: 19663	This strike exploits a PHP include flaw in the Headline Portal Engine web application. An attacker could exploit this vulnerability to execute arbitrary server-side script code.
Strike IBM Lotus Sametime StMux.exe Buffer Overflow	CWE: 119 CVE: 2008-2499 BID: 29328	This strike triggers a stack buffer overflow in IBM Lotus Sametime Server (StMux.exe) by doing a POST request with an overly long path.
Strike Internet Explorer AxDebugger.Document DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the AxDebugger.Document COM object.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike CapiCom.Utilities ActiveX GetRandom Integer Overflow Denial of Service		This strike causes a denial of service in Microsoft's CapiCom.Utilities ActiveX Control by exploiting an integer overflow in the 'GetRandom' function.
Strike Internet Explorer HtmlDlgSafeHelper.HtmlDlgSafeHelper.BlockFormats DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the HtmlDlgSafeHelper.HtmlDlgSafeHelper COM object.
Strike Internet Explorer Internet.PopupMenu.RemoveItem DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the Internet.PopupMenu COM object.
Strike Internet Explorer OutlookExpress.AddressBook DoS	CWE: 119 CVE: 2005-4840	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the OutlookExpress.AddressBook COM object.
Strike Internet Explorer Sysmon DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the Sysmon COM object.
Strike Microsoft IIS 5.0 ISAPI .printer Extension Host Header Overflow Variant 2	CVE: 2001-0241 BID: 2674	This strike exploits a buffer overflow in the .printer ISAPI extension for Microsoft IIS 5.0 when handling long Host HTTP headers.
Strike Liquid XML Studio 2010 OpenFile() ActiveX Buffer Overflow		This strike exploits a buffer overflow vulnerability present in the OpenFile() method of the LtXmlComHelp8.dll ActiveX control included with Liquid XML Studio 2010.
Strike IBM Lotus Domino HTTP Header Accept-Language Buffer Overflow	CWE: 119 CVE: 2008-2240 BID: 29310	This strike exploits a buffer overflow flaw in the IBM Lotus Domino web server. If a specially formatted URI is requested in combination with an overly long Accept-Language value, the flaw will be triggered, possibly allowing an attacker to execute arbitrary code.
Strike IBM Lotus Domino HTTP Redirect Buffer Overflow	CVE: 2003-0178 BID: 6870	This strike exploits a buffer overflow flaw in the IBM Lotus Domino web server.
Strike MagnetoSoft ICMP AddDestinationEntry ActiveX Control Buffer Overflow		This module exploits a buffer overflow in the MagnetoSoft ICMP AddDestinationEntry ActiveX Control.

Name	References	Description
Strike Operation Quicksand Nov 2020 Campaign - Powershell Malware File Transfer	MD5: 2e7b4ae4b aa70458824 8b425b8e02 7bf  SHA1: 60b5b41bd5 98fd844630 fdf609539fc 854437392  SHA256: 8bbcd7013 e339cca41c f85a0788ef0 fc250b5451 5a038eff6d4 838a16be04 7d7	This strike simulates the download of the Powershell malware via an HTTP GET request.
Strike McAfee EPolicy Orchestrator Source Header Overflow	BID: 20288  CVE: 2006-5156	This strike exploits buffer overflow in the EPolicy Orchestrator HTTP service.
Strike Microsoft Visual FoxPro 6 fpole.ocx FoxDoCmd ActiveX Command Execution	BID: 25977  CWE: 78  CVE: 2007-5322	This strike exploits an input sanitization flaw in Microsoft Visual FoxPro 6 that allows arbitrary commands to be executed by the FoxDoCmd method of the fpole.ocx ActiveX control.
Strike Microsoft Windows Media Services Logging ISAPI Buffer Overflow (121)	  CVE: 2003-0227  BID: 7727	This strike exploits a stack-based buffer overflow in Microsoft Windows Media Services via a 121 byte POST to nsiislog.dll which results in remote code execution.
Strike Microsoft Windows Media Services Logging ISAPI Buffer Overflow (5000)	  CVE: 2003-0227  BID: 7727	This strike exploits a stack-based buffer overflow in Microsoft Windows Media Services via a 5000 byte POST to nsiislog.dll which results in remote code execution.
Strike Microsoft Windows Media Services Logging ISAPI Buffer Overflow (510)	  CVE: 2003-0227  BID: 7727	This strike exploits a stack-based buffer overflow in Microsoft Windows Media Services via a 510 byte POST to nsiislog.dll which results in remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Windows Compressed Folder Exploit Download (HTTP)	CVE: 2004-0575	This strike exploits a vulnerability in Microsoft Windows when opening a zip file containing a file with a long filename. This strike simulates downloading a malicious zip file via HTTP.
Strike Microsoft Internet Explorer Install Engine SetCifFile Heap Overflow	CVE: 2004-0216 BID: 11366	This strike exploits a heap buffer overflow in the Microsoft Internet Explorer Install Engine ActiveX control.
Strike Microsoft Internet Explorer WMSpecialEffectDX T2Inputs.bstrProper tyName Memory Corruption	CWE: 94 CVE: 2006-1303 BID: 18328	This strike exploits a vulnerability in Microsoft Internet Explorer when instantiating the wmm2fxa.dll component.
Strike Microsoft Visio File Version Code Execution (HTTP)		This strike exploits an arbitrary code execution flaw in Microsoft Visio 2002. The vulnerability is triggered when a version is specified that is less than six and greater than zero.
Strike Microsoft Windows PDF URI Handling Arbitrary Command Execution (HTTP)	CWE: 94 CVE: 2007-5020 BID: 25748	This strike exploits a command execution vulnerability in Microsoft Windows XP and 2003 URI handling via the Adobe Acrobat 8.x PDF (.pdf) "mailto" URI object's resolving functionality when paired with IE7 as the default URI handler.
Strike Internet Explorer - Snapshot Viewer for Microsoft Access ActiveX Arbitrary File Download Variant 2	CWE: 94 CVE: 2008-2463 BID: 30114	This strike exploits a malicious instantiation of the Snapshot Viewer for Microsoft Access ActiveX control. Due to a design error, a malicious web page may silently download executable files from an Internet site to any location on the victim's hard drive, including auto-start extensibility points (ASEPs). These programs, in turn, may then silently run with the privileges of the currently-logged on user.
Strike Internet Explorer - Snapshot Viewer for Microsoft Access ActiveX Arbitrary File Download Variant 3	CWE: 94 CVE: 2008-2463 BID: 30114	This strike exploits a malicious instantiation of the Snapshot Viewer for Microsoft Access ActiveX control. Due to a design error, a malicious web page may silently download executable files from an Internet site to any location on the victim's hard drive, including auto-start extensibility points (ASEPs). These programs, in turn, may then silently run with the privileges of the currently-logged on user.
Strike ISA Server 2006 XSS in CookieAuth.dll	CWE: 79 CVE: 2009-0237	A cross-site scripting vulnerability exists in Microsoft ISA Server 2006.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Embedded OpenType Font Parser Code Execution (HTTP)	CWE: 119 CVE: 2009-0231	This strike exploits a vulnerability in Microsoft's Embedded OpenType file parsing engine when parsing an EOT file containing malicious OpenType font file structure data.
Strike Microsoft ASP.NET Request Scheduling DoS	BID: 35985 CWE: 20 CVE: 2009-1536	This strike exploits a DoS bug in the Microsoft .NET Framework via IIS with ASP.NET configured to use integrated mode.
Strike Microsoft Outlook Web Components ActiveX Spreadsheet Control Overflow	CWE: 119 CVE: 2009-1534 BID: 35992	This strike exploits a stack overflow with an SEH overwrite in the Outlook Web Components Spreadsheet ActiveX Control. The HTMLURL property is used as the attack vector delivered via HTML/JavaScript code rendered in Internet Explorer.
Strike Windows Media Player ASF Media File Format Parsing Code Execution (HTTP)	CWE: 119 CVE: 2009-2527	This strike exploits a code execution vulnerability in Microsoft Windows Media Player 6.4 when parsing an Advanced System Format (.ASF/.WMV/.WMA) file containing a Header Extension Object which contains a Index Object with an overly large IndexEntriesCount value.
Strike Windows Media Player ASF Media File Format Header Extension Parsing Code Execution (HTTP)	CWE: 119 CVE: 2009-2527	This strike exploits a code execution vulnerability in Microsoft Windows Media Player 6.4 when parsing an Advanced System Format (.ASF/.WMV/.WMA) file containing a Header Extension Object which contains a Marker Object with an overly large MarkersCount value.
Strike Microsoft Embedded OpenType Font Parser Directory Entry Summed Length & Offset Integer Wrap Code Execution (HTTP)	CWE: 94 CVE: 2009-2514	This strike exploits a vulnerability in Microsoft's Embedded OpenType file parsing engine when parsing an EOT file containing a directory entry where the directory entry's length and offset summed cause an integer wrap. This wrapped integer is then subsequently used to allocate memory for the directory. When the directory data is then written to the allocated buffer, it is overflowed resulting in heap corruption and control of code execution.
Strike Netscape-iPlanet Search NS-Query-Pat Traversal (Unix)	CVE: 2002-1042 BID: 5191	This strike exploits a directory traversal flaw in search engine provided with the Netscape and iPlanet web servers.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Novell GroupWise Messenger HTTP Response Handling Stack Buffer Overflow	CWE: 119 CVE: 2008-2703 BID: 29602	This strike exploits a stack-based buffer overflow present in Novell GroupWise Messenger (GWIM) Client before 2.0.3 HP1 for Windows which allows remote code execution by way of "spoofed server responses" that contain a long string after the NM_A_SZ_TRANSACTION_ID field name.
Strike Opera JavaScript Alert() Buffer Overflow		This strike exploits a flaw in Opera 10.10 in which overly long values given to the JavaScript Alert() function can cause the browser to crash
Strike Opera 10.53 JavaScript getImageData() Memory Corruption DoS		This strike exploits a flaw in Opera 10.53 in which a malformed call to the JavaScript getImageData() function can cause the browser to crash.
Strike Oracle HTTP Server username XSS Vulnerability	BID: 9484 CVE: 2004-2115	This strike exploits an XSS vulnerability in the Oracle HTTP Server (based on Apache)
Strike Oracle HTTP Server password XSS Vulnerability	BID: 9484 CVE: 2004-2115	This strike exploits an XSS vulnerability in the Oracle HTTP Server (based on Apache)
Strike Oracle HTTP Server action XSS Vulnerability	BID: 9484 CVE: 2004-2115	This strike exploits an XSS vulnerability in the Oracle HTTP Server (based on Apache)
Strike Oracle Java 5,6,7 ZipFile readCEN Denial of Service	BID: 52013 CVE: 2012-0501	This strike exploits an denial of service vulnerability in Oracle Java. The vulnerability is due to a recursion error in the Oracle Java ZipFile class when a malicious zipfile is processed.
Strike Oracle Secure Backup exec_qr() \$ora_osb_bgcookie Command Execution	CVE: 2008-5448 BID: 33177	This strike sends a command execution attack leveraging an unsanitized variable used by Oracle Secure Backup's exec_qr() function.
Strike Oracle Secure Backup exec_qr() \$ora_osb_lcookie Command Execution	CVE: 2008-5448 BID: 33177	This strike sends a command execution attack leveraging an unsanitized variable used by Oracle Secure Backup's exec_qr() function.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Secure Backups exec_qr() \$rbtool Command Execution	CVE: 2008-5448 BID: 33177	This strike sends a command execution attack leveraging an unsanitized variable used by Oracle Secure Backup's exec_qr() function.
Strike Oracle TimesTen Data Server Log Format String	CVE: 2008-5440 BID: 33177	This strike exploits a format string vulnerability Oracle Database 7.0.5's TimesTen Data Server. An attacker may send a format string to the event viewer, causing the component to either crash or execute malicious code.
Strike SolarWinds Storage Manager AuthenticationFilter Authentication Bypass	BID: 69438	This strike exploits a vulnerability inside SolarWinds Storage Manager which allows bypass of authentication filters. This in turn can lead to arbitrary file upload and code execution on the target server.
Strike WebUI mainfile.php arbitrary command injection		This strike exploits a command injection vulnerability in WebUI. The vulnerability is due to improper validation of user supplied data in mainfile.php. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary code on the target system.
Strike ManageEngine Applications Manager CommonAPIUtil SyncMonitors SQL Injection		This strike exploits an SQL injection vulnerability in ManageEngine Application Manager. The vulnerability is due to improper validation of user supplied input in the SyncMonitors method. An unauthenticated attacker can exploit this vulnerability by sending crafted HTTP requests to the vulnerable server.
Strike CA Total Defense Suite UNC Management SQL Injection		This strike exploits a SQL injection vulnerability within CA Total Defense Suite. This vulnerability is due to improper sanitation of parameters in a procedure. A remote attacker can take advantage of this vulnerability to inject SQL commands.
Strike PHP POST File Upload PHP GLOBALS Variable Overwrite	CVE: 2005-3390 BID: 15250	This strike exploits a vulnerability in PHP which allows an attacker to overwrite the PHP \$GLOBALS variable when performing a POST operation with a multipart/form-data request.
Strike PHP POST File Upload Overflow	CVE: 2002-0081 BID: 4183	This strike exploits a remote heap overflow in the PHP programming language function php_mime_split.
Strike Microsoft Powerpoint 2003 Heap Overflow (HTTP)		This strike exploits a heap overflow vulnerability in Microsoft Office 2005 Powerpoint

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Redaxo CMS Addon MyEvents 2.2.1 - SQL Injection	EXPLOITDB : 44261	This strike exploits a SQL injection vulnerability in the Redaxo CMS Addon MyEvents. This vulnerability is due to improper sanitization for the parameter "myevents_id". A remote attacker can access backend contents with successful exploitation.
Strike Safari Use-After-Free Parent.Close() Vulnerability	CWE: 399 CVE: 2010-1939 BID: 39990	Safari 4.0.5 and 4.0.4 are vulnerable to a use-after-free exploit that can lead to code execution. Other versions (4.0.X versions prior to 4.0.4) are at least susceptible to denial of service attacks via the same vector. The vulnerability is triggered when a child window stores a reference to its parent, attempts to close the parent, and then tries to access a property/call a function on the parent.
Strike Microsoft Sharepoint 2007 Path Info XSS	BID: 23832  CWE: 79  CVE: 2007-2581	This strike triggers a cross-site scripting vulnerability in the Microsoft Sharepoint 2007 web service.
Strike Skype URI Handler Input Validation Vulnerability	BID: 38699	This strike exploits a vulnerability in the way Skype parses skype-protocol urls, such as skype:user123?call. The vulnerability allows an attacker to pass additional command-line arguments to the Skype executable, which may force the user to persist his/her credentials in a remote location, such as an UNC share.
Strike SolusLabs SolusVM centralbackup.php SQL injection arbitrary command execution		This strike exploits a SQL injection vulnerability with arbitrary command execution in SolusVM. A specially crafted POST request can be sent to an active VM, resulting in arbitrary command execution.
Strike Squid HTTP header buffer overflow	CWE: 119  CVE: 2013-4115  BID: 61111	This strike exploits a buffer overflow vulnerability in Squid. This vulnerability is due to improper handle large header in HTTP request.
Strike NetWin SurgeMail Webmail Server page Parameter Format String	CWE: 134  CVE: 2008-1055  BID: 27990	This strike simulates a format string attack against the NetWin SurgeMail webmail server.
Strike Ultimate PHP Board User-Agent HTTP Header Code Execution	CVE: 2003-0395	This strike exploits a code execution flaw in the Ultimate PHP Board web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike VEGO Web Forum index.php theme_id Parameter SQL Injection Variant 2 (<v1.26)	CVE: 2006-0065 BID: 16107	This strike exploits a SQL injection flaw in the VEGO web forum.
Strike VLC Ogg Vorbis Comment Header Format String (HTTP)	BID: 24555 CVE: 2007-3316	This strike exploits a format string vulnerability in VLC when decoding Ogg Vorbis files. This strike simulates downloading a malicious file via HTTP.
Strike WebBBS webbbs_config.pl followup Parameter Shell Execution	CVE: 2002-1993 BID: 5048	This strike exploits a remote command execution flaw in the WebBBS bulletin board application.
Strike Wireshark Profinet DCP Dissector Name of Station Set Request Format String Vulnerability		This strike triggers a denial of service vulnerability in the Wireshark network protocol analyzer. The method for triggering the vulnerability is to transfer a malicious pcap file over the HTTP protocol.
Strike Word Macro HTTP Exfiltration Macro-enabled VBA Maldoc Command and control		This strike exfiltrates host information via HTTP POST request.
Strike Microsoft WordPad Embedded COM Code Execution (InstallEngine) (HTTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the InstallEngine COM control into the OLE section of a WordPad RTF document.
Strike Microsoft WordPad Embedded COM Code Execution (Sysmon.3) (HTTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the Sysmon.3 COM control into the OLE section of a WordPad RTF document and defines a set of corrupt OLE properties that will cause a crash on load.
Strike Wordpress Download Manager Plugin Remote File Upload		A remote file upload vulnerability exists in Wordpress Download Manager Plugin versions prior to 2.7.5. This vulnerability allows an unauthenticated attacker to upload a file to the web server and could facilitate remote code execution with the privileges of the account running the web server application.
Strike Wordpress page-flip-image-gallery plugins Remote File Upload		This strike exploits a remote file upload vulnerability inside wordpress page flip image gallery plugin.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike WordPress Property Plugin PHP File Upload Code Execution	BID: 53787	This strike identifies a vulnerability in the WordPress Property plugin. Due to improper validation, a user can upload a file to a temporary directory that will allow for remote code to be executed.
Strike Netscape Server WP Tag Directory Index Variant 8	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 9	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Joomla Plugin Mod_simplefileupload File Upload		This strike exploits a file upload vulnerability present in Joomla mod_simplefileupload plugin. By exploiting this vulnerability, an unauthenticated attacker can run arbitrary code by uploading files on the server and execute them. Note: This vulnerability was disclosed by the XAttacker tool.
Strike XAttacker Tool Prestashop Addons Arbitrary File Upload		This strike exploits file upload vulnerabilities in Prestashop CMS addons targeted by recently published XAttacker Tool. The main issue is the lack of sanitization of the user-supplied files by the components in charge of handling files upload queries. By exploiting these vulnerabilities, an unauthenticated attacker can run arbitrary code by uploading files on the server and execute them.
Strike XAttacker Tool WordPress Plugins Arbitrary File Upload (verified)	CVE: 2015-2825 EXPLOITDB : 36374 EXPLOITDB : 34922 EXPLOITDB : 36640	This strike exploits a series of file upload vulnerabilities in different Wordpress Plugins targeted by recently published XAttacker Tool. The common issue is the lack of sanitization of the user-uploaded files in the components in charge of handling files upload queries. . By exploiting this vulnerabilities, an unauthenticated attacker can run arbitrary code by uploading files on the server and execute them.
Strike Multiple ManageEngine Products It360SPUtil SQL Injection		This strike exploits an SQL injection vulnerability in ManageEngine Applications Manager and ManageEngine IT360 MSP Edition. The vulnerability is due to improper validation of It360SPUtil resIds HTTP parameter. An attacker could exploit this vulnerability by sending an unauthenticated malicious request to the server, compromising the integrity of the database.
Strike Trend Micro Safe Sync Reconnect Query String Multiple Parameters Command Injection		This strike exploits a command execution vulnerability in Trend Micro Safe Sync. Several query string parameters accepted by the reconnect command are vulnerable to command injection. An authenticated attacker can connect, disconnect, and then send a specially crafted HTTP command to reconnect in order to achieve arbitrary code execution with root privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Trend Micro IWSVA deploywizard haport Parameter Command Injection		This strike exploits a command execution vulnerability in Trend Micro InterScan Web Security Virtual Appliance (IWSVA). The haport parameter, which is sent in HTTP GET requests to the /deploywizard/deploywizard.do uri, is vulnerable to command injection and is not sanitized. An attacker can send a specially crafted HTTP GET request to achieve arbitrary command execution. NOTE: By default the vulnerable services are accessed via SSL connection (port 8443)
Strike ZebraFeeds controller.php zf_path Parameter PHP File Include	CVE: 2007-1010 BID: 22576	This strike exploits a PHP include flaw in ZebraFeeds 1.1.
Strike Microsoft SharePoint WSDL DISCO Inifinate Loop Denial of Service	CWE: 20 CVE: 2013-0081 BID: 62205	Microsoft SharePoint contains a denial of service vulnerability. When a non-existent custom web application is requested, the program will enter an infinite loop while searching for the web application, resulting in a denial of service condition.
Strike Arcserve Unified Data Protection Console Multiple Directory Traversal Vulnerabilities	CWE: 22 CVE: 2015-4068 BID: 74845	This strike exploits a directory traversal vulnerability in Arcserve Unified Data Protection prior to version 5.0 update 4. The vulnerability is caused by improper validation of a file path supplied by the user in the export and reportFile servlets. A remote, unauthenticated attacker could exploit this by sending crafted requests to the application, leading to denial-of-service, information disclosure and, possibly, loss of information.
Strike Oracle WebLogic Server Directory Traversal Vulnerability	CVE: 2020-14750 CWE: 22	This strike exploits a directory traversal vulnerability in Oracle WebLogic Server. The vulnerability arises due to improper input validation which allows attackers to bypass authentication mechanisms. A remote, unauthenticated attacker can send crafted HTTP requests containing double encoded directory traversal sequences to access restricted paths such as console.portal without proper authentication. Successful exploitation could lead to remote code execution, potentially resulting in full compromise of the Oracle WebLogic Server.
Strike Sun Java Plugin JNLP Argument Injection (Debug)	BID: 12847  CVE: 2005-0418  CVE: 2005-0836	This strike exploits a flaw in the Sun Java plugin that allows arbitrary code execution through malicious JNLP files.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Sun Java Plugin JNLP Argument Injection (Policy)	BID: 12847  CVE: 2005-0418  CVE: 2005-0836	This strike exploits a flaw in the Sun Java plugin that allows arbitrary code execution through malicious JNLP files.
Strike Apple OS X QuickDraw GetSrcBits32ARGB Memory Corruption Denial of Service (IMAP4)	BID: 22207  CVE: 2007-0462	This strike exploits a denial of service condition in Apple's Mac OS X when opening a malformed PICT file.
Strike Microsoft Excel NULL Pointer DoS (A) (IMAP4)	BID: 22717  CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Microsoft Excel NULL Pointer DoS (B) (IMAP4)	BID: 22717  CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Chicken of the VNC Hostname Size Denial of Service	CVE: 2007-0756  BID: 22372	This strike causes a denial of service in the Chicken of the VNC client program by specifying a long hostname length field in a VNC server.
Strike Adobe Acrobat Reader getIcon Memory Corruption (IMAP4 Base64)	BID: 34169  CWE: 20  CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Adobe Acrobat Reader getIcon Memory Corruption (IMAP4 Quoted Printable)	BID: 34169  CWE: 20  CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike GDI+ PNG Integer Overflow Vulnerability (IMAP4 Quoted Printable)	CWE: 189  CVE: 2009-3126	This strike exploits the way the buffer size for the pixel data in interlaced PNGs is calculated by GDI+. The methods used by GDI+ contain integer overflow vulnerabilities.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Media Player ASX File Heap Overflow (IMAP4 Base64)	CWE: 119 CVE: 2006-6134 BID: 21247	Microsoft Windows Media Player contains a vulnerability that will cause memory corruption when a malicious *.asx file is opened
Strike Windows Media Player ASX File Heap Overflow (IMAP4 Quoted Printable)	CWE: 119 CVE: 2006-6134 BID: 21247	Microsoft Windows Media Player contains a vulnerability that will cause memory corruption when a malicious *.asx file is opened
Strike Microsoft Windows AVIFile Media File Truncation Code Execution (IMAP4 Base64)	BID: 35967 CWE: 94 CVE: 2009-1545	This strike exploits a vulnerability in Microsoft Windows when parsing an AVI file with truncated AVIH chunk data.
Strike Digium Asterisk Manager Shell Execution	CWE: 287 CVE: 2012-2414 BID: 53206	This strike exposes an ability for an authenticated user to run an arbitrary shell command without restriction.
Strike Internet Explorer EMF File Rendering Denial of Service (IMAP4)	CWE: 399 CVE: 2005-0803 BID: 12834	This strike exploits a denial of service flaw in Microsoft Windows. This flaw is triggered through a malformed Windows EMF Metafile. This strike simulates downloading an EMF file via IMAP4.
Strike Microsoft Windows LoadImage API Overflow (IMAP4)	BID: 12095 CVE: 2004-1049	This strike exploits a flaw in the parsing of images via LoadImage on Microsoft Windows. This strike simulates downloading a malicious .ani animated cursor in an IMAP4 message.
Strike MWindows Mail HTML Link Program Execution (IMAP4)	BID: 23103 CVE: 2007-1658	This strike exploits an arbitrary program execution flaw in the Windows Mail client. This flaw is triggered when a user clicks a hyperlink within an HTML email.

Name	References	Description
Strike MWindows Mail HTML Link Program Execution UNC (IMAP4)	BID: 23103  CVE: 2007-1658	This strike exploits an arbitrary program execution flaw in the Windows Mail client. This flaw is triggered when a user clicks a hyperlink within an HTML email.
Strike Microsoft Windows Vista Contact Gadget Remote Code Execution (IMAP4)	CVE: 2007-3032  BID: 25304	This strike exploits a flaw in the Contact Gadget in Microsoft Vista when displaying a malicious contact.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpendgroup) (IMAP4 Base64)	CWE: 399  CVE: 2008-4030	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid 'dpendgroup' directives.
Strike UNIX rlogind Service -root Authentication Bypass	CVE: 1999-0113  BID: 458	This strike exploits an authentication bypass vulnerability present in certain versions of the rlogin service.
Strike Microsoft Windows SMB NT Rename Buffer Overflow	CWE: 20  CVE: 2017-0146  BID: 96707	This strike exploits a buffer overflow vulnerability in Microsoft Windows SMB Service. The vulnerability can be triggered by sending an overly large NT Trans request. A remote, unauthenticated attacker could exploit this vulnerability to execute arbitrary code on the target system. * NOTE: This vulnerability was targeted with ShadowBrokers EternalChampion exploit
Strike Microsoft Windows SMB Information Disclosure	CWE: 200  CVE: 2017-0147  BID: 96709	This strike exploits an information disclosure vulnerability in Microsoft Windows SMB Service. The vulnerability can be triggered by sending an SMB request that reads beyond a boundary. A remote, unauthenticated attacker could exploit this vulnerability to reveal memory addresses for use with other exploits. * NOTE: This vulnerability was targeted with ShadowBrokers EternalChampion exploit
Strike SSLv2 DROWN decryption	CWE: 200  CVE: 2016-0800  CVE: 2016-0703	This strike simulates traffic which may be seen during the man-in-the-middle DROWN SSLv2 decryption attack. In order to gather enough data to break encryption, an attacker may initiate several thousand SSLv2 handshakes. This strike initiates only 100 handshakes to reduce test time, however, because the recommended remediation is to completely disable SSLv2, even one handshake should be viewed as suspicious.

Name	References	Description
Strike Cisco NX-OS Command Injection	BID: 50347 CWE: 264 CVE: 2011-2569	This strike exploits a vulnerability in the input sanitization of Cisco's NX-OS which allows for command injection when output is piped to certain commands (less, section). This can be used to achieve privilege escalation.
Strike Oracle WebLogic Server Insecure Deserialization - RCE	CWE: 502 CVE: 2018-2628 BID: 103776	An insecure deserialization vulnerability was found in Oracle WebLogic Server due to insufficient validation of serialized data. Vulnerability can be exploited by sending a specially crafted serialized object. Successful exploitation can result in arbitrary code execution in the context of the user running WebLogic.
Strike AI LLM Database Create Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level CREATE operation. The request is designed to trigger the LLM into producing a SQL query that performs schema creation tasks, such as creating new tables, schemas or databases. The LLM's response includes a full SQL CREATE statement which, if executed, could result in unauthorized database changes or setup of malicious data structures. Target LLM: Gemini
Strike AI LLM Database Create Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level CREATE operation. The request is designed to trigger the LLM into producing a SQL query that performs schema creation tasks, such as creating new tables, schemas or databases. The LLM's response includes a full SQL CREATE statement which, if executed, could result in unauthorized database changes or setup of malicious data structures. Target LLM: Grok
Strike AI LLM Database Create Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level CREATE operation. The request is designed to trigger the LLM into producing a SQL query that performs schema creation tasks, such as creating new tables, schemas or databases. The LLM's response includes a full SQL CREATE statement which, if executed, could result in unauthorized database changes or setup of malicious data structures. Target LLM: OpenAI
Strike AI LLM Database Delete Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level DELETE operation. The request is designed to trigger the LLM into producing a SQL query that performs data deletion tasks, such as deleting records from tables or removing specific data entries. The LLM's response includes a full SQL DELETE or DROP statement which, if executed, could result in unauthorized data loss or corruption of the database. Target LLM: Gemini
Strike AI LLM Database Delete Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level DELETE operation. The request is designed to trigger the LLM into producing a SQL query that performs data deletion tasks, such as deleting records from tables or removing specific data entries. The LLM's response includes a full SQL DELETE or DROP statement which, if executed, could result in unauthorized data loss or corruption of the database. Target LLM: Grok

Name	References	Description
Strike AI LLM Database Delete Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level DELETE operation. The request is designed to trigger the LLM into producing a SQL query that performs data deletion tasks, such as deleting records from tables or removing specific data entries. The LLM's response includes a full SQL DELETE or DROP statement which, if executed, could result in unauthorized data loss or corruption of the database. Target LLM: OpenAI
Strike AI LLM Database Read Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level READ operation. The request is designed to trigger the LLM into producing a SQL query that performs data retrieval tasks, such as selecting data from tables or querying specific information. The LLM's response includes a full SQL SELECT statement which, if executed, could result in unauthorized data access or exposure of sensitive information. Target LLM: Gemini
Strike AI LLM Database Read Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level READ operation. The request is designed to trigger the LLM into producing a SQL query that performs data retrieval tasks, such as selecting data from tables or querying specific information. The LLM's response includes a full SQL SELECT statement which, if executed, could result in unauthorized data access or exposure of sensitive information. Target LLM: Grok
Strike AI LLM Database Read Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level READ operation. The request is designed to trigger the LLM into producing a SQL query that performs data retrieval tasks, such as selecting data from tables or querying specific information. The LLM's response includes a full SQL SELECT statement which, if executed, could result in unauthorized data access or exposure of sensitive information. Target LLM: OpenAI
Strike AI LLM Database Update Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level UPDATE operation. The request is designed to trigger the LLM into producing a SQL query that performs data modification tasks, such as updating existing records in a database. The LLM's response includes a full SQL UPDATE statement which, if executed, could result in unauthorized data changes or corruption of existing information. Target LLM: Gemini
Strike AI LLM Database Update Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level UPDATE operation. The request is designed to trigger the LLM into producing a SQL query that performs data modification tasks, such as updating existing records in a database. The LLM's response includes a full SQL UPDATE statement which, if executed, could result in unauthorized data changes or corruption of existing information. Target LLM: Grok
Strike AI LLM Database Update Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level UPDATE operation. The request is designed to trigger the LLM into producing a SQL query that performs data modification tasks, such as updating existing records in a database. The LLM's response includes a full SQL UPDATE statement which, if executed, could result in unauthorized data changes or corruption of existing information. Target LLM: OpenAI

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM Prompt Injection Deceptive Delight - Gemini		This strike sends a "Deceptive Delight" prompt to the Gemini LLM. This technique manipulates the Gemini LLM by embedding harmful prompts that lead the model to generate harmful responses under the guise of providing helpful information. The structured prompt subtly guides the LLM into formulating high-risk responses while appearing innocuous. Note: This strike will randomly select a harmful prompt from the Forbidden questions set and embed it within the prompt. Target LLM: Gemini
Strike AI LLM Prompt Injection Deceptive Delight - Grok		This strike sends a "Deceptive Delight" prompt to the Grok LLM. This technique manipulates the Grok LLM by embedding harmful prompts that lead the model to generate harmful responses under the guise of providing helpful information. The structured prompt subtly guides the LLM into formulating high-risk responses while appearing innocuous. Note: This strike will randomly select a harmful prompt from the Forbidden questions set and embed it within the prompt. Target LLM: Grok
Strike AI LLM Prompt Injection Deceptive Delight - OpenAI		This strike sends a "Deceptive Delight" prompt to the OpenAI LLM. This technique manipulates the OpenAI LLM by embedding harmful prompts that lead the model to generate harmful responses under the guise of providing helpful information. The structured prompt subtly guides the LLM into formulating high-risk responses while appearing innocuous. Note: This strike will randomly select a harmful prompt from the Forbidden questions set and embed it within the prompt. Target LLM: OpenAI
Strike AI LLM Disease Vector URL Prompt - Gemini		This strike sends a disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URL-based prompt to the Gemini LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects such URLs from the dataset and uses them inside the prompt. Target LLM: Gemini
Strike AI LLM Disease Vector URL Prompt - Grok		This strike sends a disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URL-based prompt to the Grok LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects such URLs from the dataset and uses them inside the prompt. Target LLM: Grok
Strike AI LLM Disease Vector URL Prompt - OpenAI		This strike sends a disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URL-based prompt to the OpenAI LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects such URLs from the dataset and uses them inside the prompt. Target LLM: OpenAI
Strike AI LLM Disease Vector URL Response - Gemini		This strike sends a prompt to the Gemini LLM asking it to generate a response which includes disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URLs. This randomly selects a few URLs from the dataset and uses them inside the LLM response. Target LLM: Gemini

Name	References	Description
Strike AI LLM Disease Vector URL Response - Grok		This strike sends a prompt to the Grok LLM asking it to generate a response which includes disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URLs. This randomly selects a few URLs from the dataset and uses them inside the LLM response. Target LLM: Grok
Strike AI LLM Disease Vector URL Response - OpenAI		This strike sends a prompt to the OpenAI LLM asking it to generate a response which includes disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URLs. This randomly selects a few URLs from the dataset and uses them inside the LLM response. Target LLM: OpenAI
Strike AI LLM Link Trap PII Leakage Banking Information - Gemini		This strike simulates a Link Trap prompt injection attack, which tricks the LLM into revealing previous chat data. The attack involves including a hyperlink in the prompt and instructing the LLM to append the previous conversation or a summary of it as a base64-encoded value in the link's query parameter. If the user clicks on the link generated by the LLM, the encoded chat history is exfiltrated to the attacker's domain via the query string. In this strike, we simulate the disclosure of personally identifiable information (PII) related to banking data, such as account holder name, account number, bank balance, registered phone number and email address. Note: API-based interactions do not retain conversational context, so to realistically simulate the Link Trap attack, prior chat history is included within the same request. It is also assumed that the user is tricked via social engineering or other means into submitting the malicious prompt containing the attacker's link to the LLM. Target LLM: Gemini
Strike AI LLM Link Trap PII Leakage Banking Information - Grok		This strike simulates a Link Trap prompt injection attack, which tricks the LLM into revealing previous chat data. The attack involves including a hyperlink in the prompt and instructing the LLM to append the previous conversation or a summary of it as a base64-encoded value in the link's query parameter. If the user clicks on the link generated by the LLM, the encoded chat history is exfiltrated to the attacker's domain via the query string. In this strike, we simulate the disclosure of personally identifiable information (PII) related to banking data, such as account holder name, account number, bank balance, registered phone number and email address. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: OpenAI
Strike AI LLM PII in User Requests Protected Health Information (PHI) Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Gemini

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM PII in User Requests Protected Health Information (PHI) Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Grok
Strike AI LLM PII in User Requests Protected Health Information (PHI) Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack Claude template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack Claude template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack Claude template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack ICL One Shot template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends icl-one-shot prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack ICL One Shot template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends icl-one-shot prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour Target LLM: Grok

Name	References	Description
Strike AI LLM Prompt Injection Adaptive Attack ICL One Shot template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends icl-one-shot prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack Refined Best Simple template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack Refined Best Simple template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack Refined Best Simple template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack Refined Simple template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends refined-best prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack Refined Simple template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends refined-best prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack Refined Simple template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends refined-best prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI

Name	References	Description
Strike AI LLM Prompt Injection P2SQL - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level CRUD (Create, Read, Update, Delete) operation. The request is designed to trigger the LLM into producing a SQL query that performs data manipulation tasks, such as creating new records, reading existing data, updating records, or deleting entries. The LLM's response includes a full SQL statement which, if executed, could result in unauthorized database changes or exposure of sensitive information. Target LLM: Gemini
Strike AI LLM Prompt Injection P2SQL - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level CRUD (Create, Read, Update, Delete) operation. The request is designed to trigger the LLM into producing a SQL query that performs data manipulation tasks, such as creating new records, reading existing data, updating records, or deleting entries. The LLM's response includes a full SQL statement which, if executed, could result in unauthorized database changes or exposure of sensitive information. Target LLM: Grok
Strike AI LLM Prompt Injection P2SQL - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level CRUD (Create, Read, Update, Delete) operation. The request is designed to trigger the LLM into producing a SQL query that performs data manipulation tasks, such as creating new records, reading existing data, updating records, or deleting entries. The LLM's response includes a full SQL statement which, if executed, could result in unauthorized database changes or exposure of sensitive information. Target LLM: OpenAI

## New Malware Samples (388)

Attack profile that aims to simulate malwares.

Name	Description
Strike Allakore_058bde7b	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 058bde7b3385b70d59120b24390377af.
Strike Allakore_09096930	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 09096930751d28d388d3e0de003bcb7b.
Strike Allakore_12dbbfcc	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 12dbbfcccd463ec884f788abd5933f8aa.
Strike Allakore_237a12a9	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 237a12a9d67614edd079c02f0f24ed45.
Strike Allakore_29a9d202	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 29a9d202ba2d46047edba9539abba0cd.
Strike Allakore_2f0b96c3	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 2f0b96c3262108012dcf9a940ae461da.
Strike Allakore_32d491d6	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 32d491d6b036c6349c4d2c3bf44011d8.
Strike Allakore_35932f58	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 35932f5856dbf8ba51e048b3b2bb2d7b.

<b>Name</b>	<b>Description</b>
Strike Allakore_3bed8895	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 3bed8895828ba27761b62e9c4ebcc2db.
Strike Allakore_40291ec2	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 40291ec2bd7f23aa76435d5d14f96758.
Strike Allakore_42300099	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 42300099a726353abfdbfd5773de83.
Strike Allakore_47ead282	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 47ead282cd7c6a667d9b4cc9b0c6935e.
Strike Allakore_59401f25	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 59401f25ac88f1c1fe0a5981dc29ea57.
Strike Allakore_59c6ae6b	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 59c6ae6bbe3d048d267d4900c9585828.
Strike Allakore_733f33fa	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 733f33faedb263d914163043b5242f0a.
Strike Allakore_746c9f8f	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 746c9f8f002fb8569d19cb2cdc1295ed.
Strike Allakore_750a3353	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 750a33531763724e8db051750a08cf99.

<b>Name</b>	<b>Description</b>
Strike Allakore_768a78b4	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 768a78b4b12efe721139c474fbf139f4.
Strike Allakore_80151f17	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 80151f17cd04b05f7765071c40215c40.
Strike Allakore_81444a9c	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is 81444a9c9f74be2c8ba32542bcc68bab.
Strike Allakore_a3d03ec0	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is a3d03ec08345e7cf02818122fc5b31f3.
Strike Allakore_a50d0d1b	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is a50d0d1bf9ab8291e986e59ebd92be14.
Strike Allakore_aa8b32b2	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is aa8b32b21dcf44a332f9c9d13af3cd7d.
Strike Allakore_ac69851a	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is ac69851a5144e0eb28923ca2e3b8cbe2.
Strike Allakore_b2cb036f	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is b2cb036f919d3cd003023c95c4bbb983.
Strike Allakore_b90a102f	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is b90a102fccedad57b06dc8fb6a58895b.

<b>Name</b>	<b>Description</b>
Strike Allakore_b99d788c	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is b99d788c4dcfd8cc7140e840bd8f5095.
Strike Allakore_bd378258	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is bd3782580c0ddbda2288b2d5d5a72258.
Strike Allakore_bd9d9a4b	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is bd9d9a4be3d93acf3228607b435a4828.
Strike Allakore_c48f0372	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is c48f0372aecf3a7c3d8fab599e7afcde.
Strike Allakore_c74e97cf	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is c74e97cf0086782ab8d22919b11f9c9d.
Strike Allakore_d355ff7b	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is d355ff7b4e022eff5c2b5a5aabae5ad0.
Strike Allakore_d72dfe82	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is d72dfe82b6072cb349120abdbd383aca.
Strike Allakore_df9b2ff8	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is df9b2ff8bd9164ae0f2c802c555d2c4f.
Strike Allakore_e6416904	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is e641690408faf6320fd7c820644ec889.

<b>Name</b>	<b>Description</b>
Strike Allakore_e78fa70b	This strike sends a malware sample known as Allakore. Allakore is a Remote Access Tool. This malware primarily used for spying and data exfiltration so it includes capabilities like keylogging, taking screenshots, upload/download files, and even take remote control of the victim's device. The MD5 hash of this Allakore sample is e78fa70b0e38c7c8c29048ceba2dd74.
Strike AsyncRAT_07f3f073	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 07f3f073391f7308ca1c7ef54d6c5656.
Strike AsyncRAT_0a82a328	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 0a82a32801a0a2c1bcf4371a4a582f5e.
Strike AsyncRAT_55a0c7d6	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 55a0c7d6356dfa4c7b45ef03caf2ac75.
Strike AsyncRAT_5b02fac6	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 5b02fac6ed22c683e36715e3c7ae05fc.

<b>Name</b>	<b>Description</b>
Strike AsyncRAT_5ee0d653	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 5ee0d653dba5a4308a7bf5da642daff1.
Strike AsyncRAT_67fefa4b	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 67fefa4bc5ee224e814bea6602399df8.
Strike AsyncRAT_73bd7a8e	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 73bd7a8efb5d7150633432bde16cd980.
Strike AsyncRAT_825a5d12	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 825a5d120ab305b5e12731307a0bee63.
Strike AsyncRAT_8d019622	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 8d01962215ddfe754b725fa9f835b2d6.

<b>Name</b>	<b>Description</b>
Strike AsyncRAT_94719304	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 94719304694a573b087d7efdd8ab8eed.
Strike AsyncRAT_9b1b21fe	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 9b1b21fe9b8ab2fb386dd5794c272baf.
Strike AsyncRAT_b29edf77	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is b29edf77f9af40aaaf7e5387f722d4e32.
Strike AsyncRAT_b4323259	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is b4323259d83bf99fd6f029a3c0d7e272.
Strike AsyncRAT_c2ce2c2a	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is c2ce2c2acb3b2f2ac33f459b850ba40d.

<b>Name</b>	<b>Description</b>
Strike AsyncRAT_c68996a7	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is c68996a7db8547fcbf2f3fd82a5e80ca.
Strike AsyncRAT_d4abb12d	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is d4abb12d79d42b0f392451c49cbe6733.
Strike BQTLock_058a1dbf	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 058a1dbfa03cac6cc67d34a4dcc69445.
Strike BQTLock_110df495	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 110df49522d46b612a28bafbdff3405c.
Strike BQTLock_3478194a	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 3478194a509ae4d2f0a31435952b27bc.

<b>Name</b>	<b>Description</b>
Strike BQTLock_69e6fa25	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 69e6fa25e66c23121826805bbcb890ac.
Strike BQTLock_84c7bf0	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 84c7bf0e243dd99b674e48701acob6b.
Strike BQTLock_9569c863	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 9569c8631bcd37da1a5048d979362804.
Strike BQTLock_972b1677	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 972b1677621bbdc45ef61c56cd9909d2.
Strike BQTLock_a441e0a2	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is a441e0a25276952bb4fa2f29e06fc209.
Strike BQTLock_a6d91094	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is a6d91094a222da6576260abf52a07b79.

<b>Name</b>	<b>Description</b>
Strike BQTLock_acf3b7f2	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is acf3b7f2f07f5d04083f99b82eb0c8ba.
Strike BQTLock_b098f677	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is b098f67726a4a3f7277b3f41a86d503c.
Strike BQTLock_bc8cc3ca	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is bc8cc3ca2a45ebb934cd71218d9b56b3.
Strike BQTLock_c34d690b	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is c34d690bbe1f9dc78066c881e3596505.
Strike BQTLock_d6476590	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is d647659069d09b59a0e5d3608df314b2.
Strike BQTLock_d6cb9f18	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is d6cb9f18705c34c515dbfd59c4015576.

Name	Description
Strike BQTLock_dae6729c	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is dae6729cc3bfcbd700fc7e46818aada2.
Strike BQTLock_e73abc48	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is e73abc48015c54214b2edae4a6d1ed25.
Strike BlockBlaster_2b366e71	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is 2b366e711484cb6648e02bc9d7774f3f.
Strike BlockBlaster_7aa6b31c	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is 7aa6b31c1531f57d744dc7fde5e92338.
Strike BlockBlaster_a80a3dc3	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is a80a3dc310429fd2d98228e49157f35a.
Strike BlockBlaster_d35249a3	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is d35249a3f80fdbd17f2664e3408f78e9.

<b>Name</b>	<b>Description</b>
Strike BlockBlaster_dd8da7ba	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is dd8da7bae76527590f171eeda5a41987.
Strike BlockBlaster_f240341a	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is f240341a95f7df4c154520b841d1a5e3.
Strike CastleRAT_14610b22	This strike sends a malware sample known as CastleRAT. CastleRAT is a malware of the Remote Access Trojan (RAT) family that targets primarily Ukrainian entities. It is delivered through a loader, CastleLoader, which is distributed via malicious Microsoft Word documents. Upon execution, it establishes persistence on the victim's machine, collects system information, and communicates with a command-and-control server. Its key capabilities include executing arbitrary commands, uploading and downloading files, and keylogging, all controlled remotely by the attacker. The MD5 hash of this CastleRAT sample is 14610b22a749a0cd464d1985abbff45f.
Strike CastleRAT_22b5bf29	This strike sends a malware sample known as CastleRAT. CastleRAT is a malware of the Remote Access Trojan (RAT) family that targets primarily Ukrainian entities. It is delivered through a loader, CastleLoader, which is distributed via malicious Microsoft Word documents. Upon execution, it establishes persistence on the victim's machine, collects system information, and communicates with a command-and-control server. Its key capabilities include executing arbitrary commands, uploading and downloading files, and keylogging, all controlled remotely by the attacker. The MD5 hash of this CastleRAT sample is 22b5bf2931140fae49228ced1d1dd3d7.
Strike CastleRAT_35f81d06	This strike sends a malware sample known as CastleRAT. CastleRAT is a malware of the Remote Access Trojan (RAT) family that targets primarily Ukrainian entities. It is delivered through a loader, CastleLoader, which is distributed via malicious Microsoft Word documents. Upon execution, it establishes persistence on the victim's machine, collects system information, and communicates with a command-and-control server. Its key capabilities include executing arbitrary commands, uploading and downloading files, and keylogging, all controlled remotely by the attacker. The MD5 hash of this CastleRAT sample is 35f81d066028f5e69508956bed79d3ee.

<b>Name</b>	<b>Description</b>
Strike ClayRAT_0658b719	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is 0658b719a2dcb7762743af4ea97646af.
Strike ClayRAT_074b5622	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is 074b5622421e8ed778af7d0c013c365c.
Strike ClayRAT_0abb2947	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is 0abb29472275a0d558839e3fb16a2407.
Strike ClayRAT_198505a6	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is 198505a6ac0ff95b4f9cada0a7f7a393.
Strike ClayRAT_49e0f3d2	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is 49e0f3d2284ed076ad5a72af97548fba.
Strike ClayRAT_57149137	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is 57149137ee7145ad106cdac344e70c85.

It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is aa5c7f832eb47c8b6acaf9fcbe87a699.

<b>Name</b>	<b>Description</b>
Strike ClayRAT_c5b7070e	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is c5b7070ee6e114e2311d200afdb0c804.
Strike ClayRAT_c8200034	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is c82000348c9b5a302bd5073b52c13221.
Strike ClayRAT_e2f3d7bc	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is e2f3d7bcd79bc500a64478977cb50efb.
Strike ClayRAT_e78cdced	This strike sends a malware sample known as ClayRAT. ClayRAT is a malware of the spyware family that turns infected mobile devices into distribution hubs for further malware attacks. It is primarily delivered via malicious SMS messages and Telegram links. Once executed, ClayRAT sends out numerous fraudulent messages containing malware-laden links to the victim's contact list. Its key capabilities include contact list access, message sending, and the ability to install and propagate additional malware. The MD5 hash of this ClayRAT sample is e78cdced64bc65e392faeed019812a62.
Strike DeceptiveDevelopment_250 443d3	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is 250443d3d3fe43e9d0ecacba69130842.
Strike DeceptiveDevelopment_3ae d5502	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is 3aed5502118eb9b8c9f8a779d4b09e11.

<b>Name</b>	<b>Description</b>
Strike DeceptiveDevelopment_3ef7 717c	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is 3ef7717c8bcb26396fc50ed92e812d13.
Strike DeceptiveDevelopment_535 03cbe	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is 53503cbe1d3f62e4b5fd3245ce144858.
Strike DeceptiveDevelopment_617 5efd1	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is 6175efd148a89ca61b6835c77acc7a8d.
Strike DeceptiveDevelopment_6d7 68860	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is 6d76886042d1d6957fec9b60cb4cc78d.
Strike DeceptiveDevelopment_a00 9cd35	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is a009cd35850929199ef60e71bce86830.

Strike DeceptiveDevelopment_b29 ddcc9	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is b29ddcc9affdd56a520f23a61b670134.
Strike DeceptiveDevelopment_b52 e105b	This strike sends a malware sample known as DeceptiveDevelopment. DeceptiveDevelopment is a malware that evolves from primitive crypto theft to sophisticated AI-based deception. It is typically delivered via phishing emails containing malicious attachments. Upon execution, the malware deploys a series of scripts to steal sensitive information, and later versions even utilize AI to mimic human behavior and deceive security systems. Its key capabilities involve stealing cryptocurrency wallet information, exfiltrating user data, and mimicking human behavior to evade detection. The MD5 hash of this DeceptiveDevelopment sample is b52e105bd040bda6639e958f7d9e3090.
Strike GayFemBoy_03ac6a68	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 03ac6a687be22b30ec48656235fef107.
Strike GayFemBoy_07025e99	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 07025e9990963038249ff2b771ee5d5c.
Strike GayFemBoy_0b6e8d5d	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 0b6e8d5d68dda316da6125d8f6b6ced3.
Strike GayFemBoy_0e17f987	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 0e17f987efa46626eb5d22d6516b3718.

<b>Name</b>	<b>Description</b>
Strike GayFemBoy_100d33b8	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 100d33b8167c0c7d842f0cd93f01648b.
Strike GayFemBoy_12b4f549	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 12b4f549ae5e131f01b0b1181b06c71e.
Strike GayFemBoy_1e715cf1	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 1e715cf11e649b8e294d7877e9ce033b.
Strike GayFemBoy_1e728e64	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 1e728e6439296e9442db6fbcb488bedc.
Strike GayFemBoy_22e99928	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 22e99928283dd4cf0d8de14511ef752d.
Strike GayFemBoy_28343b78	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 28343b780bf5d8b9e6b7a274418f997f.

It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is ff296fc2d3fc35edcbbeda8aefce75d7.
Strike GhostCall_0af11f61	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 0af11f610da1f691e43173d44643283f.
Strike GhostCall_12439688	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 1243968876262c3ad4250e1371447b23.
Strike GhostCall_5ad40a5f	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 5ad40a5fd18a1b57b69c44bc2963dc6b.
Strike GhostCall_6348b49f	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 6348b49f3499d760797247b94385fda3.

The MD5 hash of this Klopatra sample is f8e6ce9e7d1749c8f7712ff7c5e16b62.
Strike Klopatra_fa1d6028	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is fa1d6028d68b1d117438915edcb178f8.
Strike LunarSpider_21cde10c	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 21cde10c7da48bab622e75d6004d61de.

<b>Name</b>	<b>Description</b>
Strike LunarSpider_2a743bcc	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 2a743bcc9cee1900a0457127abeade60.
Strike LunarSpider_2c3d09cd	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 2c3d09cd1d8aea8cc7049296782c8def.
Strike LunarSpider_330a6bae	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 330a6bae00ad4be4a0df732520905395.
Strike LunarSpider_33f6c6b3	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 33f6c6b3727a233819111e3b3aae96ec.
Strike LunarSpider_3f21939c	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 3f21939c7db0c894b74c361d72d044db.

<b>Name</b>	<b>Description</b>
Strike LunarSpider_56d21ac3	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 56d21ac3631f52b18325224214dcbd73.
Strike LunarSpider_628d88e9	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 628d88e98c44d9846954fd7bbb8e143.
Strike LunarSpider_66b559df	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 66b559df3b20b0280322e9bf67752d6a.
Strike LunarSpider_97be7a2e	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 97be7a2e8918be589396de0eaf97a590.
Strike LunarSpider_a0ffaf70	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is a0ffaf708b8c44e7fd3a5a505acc015b.

<b>Name</b>	<b>Description</b>
Strike LunarSpider_a3254b2e	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is a3254b2ef6bca343aa158261d7a46c50.
Strike LunarSpider_d58be0d4	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is d58be0d4dcc144ca9d6a1ecf9e8232f9.
Strike LunarSpider_e0df61c7	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is e0df61c7e5c764396970dd47d4589c01.
Strike LunarSpider_fd817202	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is fd817202314d4067c2dc9c51d98f0268.
Strike Maranhao_bf646eec	This strike sends a malware sample known as Maranhao. Maranhao Stealer is a Node.js powered malware of the info-stealer type that targets sensitive user data. It is delivered through phishing emails containing malicious attachments or links. Upon execution, it collects various types of sensitive information including browser data, cryptocurrency wallets, and system information. Its key capabilities include data exfiltration, system information collection, and credential theft from multiple sources such as browsers and cryptocurrency wallets. The MD5 hash of this Maranhao sample is bf646eec3161c66a48001eba3e2772a4.

Name	Description
Strike Maranhao_c9912bd4	This strike sends a malware sample known as Maranhao. Maranhao Stealer is a Node.js powered malware of the info-stealer type that targets sensitive user data. It is delivered through phishing emails containing malicious attachments or links. Upon execution, it collects various types of sensitive information including browser data, cryptocurrency wallets, and system information. Its key capabilities include data exfiltration, system information collection, and credential theft from multiple sources such as browsers and cryptocurrency wallets. The MD5 hash of this Maranhao sample is c9912bd4cb21fa0fc9fc1a0311cb95ed.
Strike Maranhao_dc2ebe2f	This strike sends a malware sample known as Maranhao. Maranhao Stealer is a Node.js powered malware of the info-stealer type that targets sensitive user data. It is delivered through phishing emails containing malicious attachments or links. Upon execution, it collects various types of sensitive information including browser data, cryptocurrency wallets, and system information. Its key capabilities include data exfiltration, system information collection, and credential theft from multiple sources such as browsers and cryptocurrency wallets. The MD5 hash of this Maranhao sample is dc2ebe2fb7935f7b2161dd4eb93d961d.
Strike PhantomNet_0fbc2bf2	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 0fbc2bf2f66fc72c521a9b8561bab1da.
Strike PhantomNet_1498f1df	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 1498f1df4ca0e9cf23babe00cf34ed3d.
Strike PhantomNet_2632fa8f	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 2632fa8fc67dd2fd5c5a6275465dcc95.

<b>Name</b>	<b>Description</b>
Strike PhantomNet_3b4ea607	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 3b4ea6079ac9f154e0d4ec2cb6d05431.
Strike PhantomNet_608877a9	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 608877a9e11101da53bce99b0effc75b.
Strike PhantomNet_66007a1c	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 66007a1ca6d07ebb4ed85bf82e79719d.
Strike PhantomNet_7de7febe	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 7de7feb6bed06c49efb4e2c3dd23e1.
Strike PhantomNet_81159738	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 81159738f7ffb50d5bc3c75e5e0ac546.

<b>Name</b>	<b>Description</b>
Strike PhantomNet_b6e3894c	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is b6e3894c17fb05db754a61ac9a0e5925.
Strike PhantomNet_bbf9216	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is bbf92161cb71825a16e49e2aa4d2750.
Strike PhantomNet_f21b63dd	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is f21b63ddd7d2a773eb21a065015cdd01.
Strike PuTTYRider_02b3a5f0	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is 02b3a5f0121fab02f22173c9e738fee6.
Strike PuTTYRider_0e041de4	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is 0e041de4bca18fdfa54c525ae524e018.

<b>Name</b>	<b>Description</b>
Strike PuTTYRider_4e61cfa7	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is 4e61cfa7d791788ae557319e83c63fb4.
Strike PuTTYRider_7b1854a4	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is 7b1854a4bd691db129459ac6f50668b6.
Strike PuTTYRider_8eb873ad	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is 8eb873ad112121cdfd0cc72688aa229f.
Strike PuTTYRider_8ed690f6	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is 8ed690f6438133f4661465253daba3bc.
Strike PuTTYRider_93b46063	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. Strike PuTTYRider_e48431ba	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is e48431ba5aa7a42ae0a32eb7d859d7a4.
Strike PuTTYRider_eb119087	This strike sends a malware sample known as PuTTYRider. PuTTYRider is a malware that is delivered through weaponized PuTTY applications. It is propagated via Bing Ads that lead to a download of the modified version of PuTTY. Once the user downloads and executes the malicious PuTTY version, it installs a backdoor that allows unauthorized access to the victim's system. Its key capabilities include remote access, data exfiltration, and providing the attacker with full control over the compromised system. The MD5 hash of this PuTTYRider sample is eb119087d7395ca0e9c32e5fc3bcbc3b.
Strike Qilin_0f73b467	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is 0f73b467ff03f9224c024f4eb3aecedb.
Strike Qilin_1c0cb55d	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is 1c0cb55d3a8d544ab0bd7d81d2985089.

<b>Name</b>	<b>Description</b>
Strike Qilin_227f14f4	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is 227f14f4c3aa35b9fb279f52c73b2e1e.
Strike Qilin_59c3334d	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is 59c3334d184159008cd45355b436d9a8.
Strike Qilin_bb8bdb3e	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is bb8bdb3e8c92e97e2f63626bc3b254c4.
Strike Qilin_e2c05908	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is e2c059083926ec2c219cebcfa4a49453.
Strike QuirkyLoader_10e8d5ac	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 10e8d5ac2618249893621ed0a41352cc.

<b>Name</b>	<b>Description</b>
Strike QuirkyLoader_1b636f0a	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 1b636f0ac4cc6de7d4471e657335bf37.
Strike QuirkyLoader_26d4d38a	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 26d4d38a8f1d00fe4a1d62e300b98d80.
Strike QuirkyLoader_2c4da8bd	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 2c4da8bd3cbb9c94aa333bd5c576506b.
Strike QuirkyLoader_4116b369	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 4116b3691852c2c165e38b8af52ea578.
Strike QuirkyLoader_57868447	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 57868447d89fda05231bb6d9cf9bb8f.

Strike QuirkyLoader_eac607ad	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is eac607ad42e1e1b8dd9f7f85cc511ec3.
Strike SDK_13ac2635	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 13ac2635f70981a33bc422b7b8a8b5fd.

<b>Name</b>	<b>Description</b>
Strike SDK_1afd6a2e	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 1afd6a2e005334df2b24175ec80d0742.
Strike SDK_287ddfa3	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 287ddfa34525de0556c521cf21115b9a.
Strike SDK_3c0eaeb3	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 3c0eaeb351d17d8ac1d42bdcf41178ad.
Strike SDK_6dab8bad	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 6dab8bad4349055397aa35f1a48e9c90.
Strike SDK_76d40886	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 76d40886dce0d57b99f7008af5e19bf.

The MD5 hash of this nimbus_manticore sample is 3a85381dd880c69f40b02859cd9fd473.
Strike nimbus_manticore_7766772 5	This strike sends a malware sample known as nimbus_manticore. Nimbus Manticore is a malware that functions as a banking Trojan and targets European countries. It is distributed through malicious email attachments and exploits vulnerabilities in Microsoft Office and Adobe Acrobat Reader. Once executed, the malware downloads and installs additional malicious payloads, including ransomware and banking Trojans. Its key capabilities include disabling antivirus software, stealing financial information, and encrypting user files for ransom. The MD5 hash of this nimbus_manticore sample is 776677256087a5a0f543a6b6317cadf8.
Strike nimbus_manticore_83b7ec5f	This strike sends a malware sample known as nimbus_manticore. Nimbus Manticore is a malware that functions as a banking Trojan and targets European countries. It is distributed through malicious email attachments and exploits vulnerabilities in Microsoft Office and Adobe Acrobat Reader. Once executed, the malware downloads and installs additional malicious payloads, including ransomware and banking Trojans. Its key capabilities include disabling antivirus software, stealing financial information, and encrypting user files for ransom. The MD5 hash of this nimbus_manticore sample is 83b7ec5f0d5d6f11ba1284a3f705e98e.

<b>Name</b>	<b>Description</b>
Strike nimbus_manticore_96a9078d	This strike sends a malware sample known as nimbus_manticore. Nimbus Manticore is a malware that functions as a banking Trojan and targets European countries. It is distributed through malicious email attachments and exploits vulnerabilities in Microsoft Office and Adobe Acrobat Reader. Once executed, the malware downloads and installs additional malicious payloads, including ransomware and banking Trojans. Its key capabilities include disabling antivirus software, stealing financial information, and encrypting user files for ransom. The MD5 hash of this nimbus_manticore sample is 96a9078d97a8b2a0cdc6632b48b8a649.
Strike nimbus_manticore_b40533e6	This strike sends a malware sample known as nimbus_manticore. Nimbus Manticore is a malware that functions as a banking Trojan and targets European countries. It is distributed through malicious email attachments and exploits vulnerabilities in Microsoft Office and Adobe Acrobat Reader. Once executed, the malware downloads and installs additional malicious payloads, including ransomware and banking Trojans. Its key capabilities include disabling antivirus software, stealing financial information, and encrypting user files for ransom. The MD5 hash of this nimbus_manticore sample is b40533e67e70b7ff7bb53d34a4b9170e.
Strike nimbus_manticore_b7e4b752	This strike sends a malware sample known as nimbus_manticore. Nimbus Manticore is a malware that functions as a banking Trojan and targets European countries. It is distributed through malicious email attachments and exploits vulnerabilities in Microsoft Office and Adobe Acrobat Reader. Once executed, the malware downloads and installs additional malicious payloads, including ransomware and banking Trojans. Its key capabilities include disabling antivirus software, stealing financial information, and encrypting user files for ransom. The MD5 hash of this nimbus_manticore sample is b7e4b752adff07ac1b7b67a9be30b366.
Strike nimbus_manticore_be2bd408	This strike sends a malware sample known as nimbus_manticore. Nimbus Manticore is a malware that functions as a banking Trojan and targets European countries. It is distributed through malicious email attachments and exploits vulnerabilities in Microsoft Office and Adobe Acrobat Reader. Once executed, the malware downloads and installs additional malicious payloads, including ransomware and banking Trojans. Its key capabilities include disabling antivirus software, stealing financial information, and encrypting user files for ransom. The MD5 hash of this nimbus_manticore sample is be2bd408c615997c600871970573f023.
Strike operation_rewrite_0721efb9	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 0721efb9a3e364a372bbb4b7b7c42193.

<b>Name</b>	<b>Description</b>
Strike operation_rewrite_5ed7d3f4	<p>This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 5ed7d3f4e83c9456363c0502a7b00fac.</p>
Strike operation_rewrite_6049f6d2	<p>This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 6049f6d24d84b335ae8eb19d049e9e42.</p>
Strike operation_rewrite_6cada79f	<p>This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 6cada79fd399172f4ff55774ad1954ce.</p>
Strike operation_rewrite_728605f7	<p>This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 728605f7586642a814e900e9b2f236fb.</p>
Strike operation_rewrite_74863e3 5	<p>This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 74863e35f68f27386eb0f65528b5855a.</p>

<b>Name</b>	<b>Description</b>
Strike operation_rewrite_920a193 8	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 920a193888df5adef270d3f05e907d8b.
Strike operation_rewrite_941cf054	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 941cf0549f9246c655e77767cacb8666.
Strike operation_rewrite_97a7823 8	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 97a78238ffa97e140d05d18611979d55.
Strike operation_rewrite_a98432ed	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is a98432ed45af026f93fb450fd9ebcdda.
Strike operation_rewrite_b1760f43	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is b1760f43574b88382fcdc589ca458254.

<b>Name</b>	<b>Description</b>
Strike operation_rewrite_db3652d 4	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is db3652d42598323481d3168409b5b9bb.
Strike operation_rewrite_e50a3e80	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is e50a3e8071e49e17d4d11e98e57cddc8.
Strike operation_rewrite_e7e8240b	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is e7e8240be190f80c52fd4c8f26f61f68.
Strike operation_rewrite_eb84dc41	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is eb84dc4121511343b0336c92715cbe5.
Strike operation_rewrite_ebe4e970	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is ebe4e97053230d841d9f5fca62caf9ac.

Name	Description
Strike operation_rewrite_f4136470	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is f413647083a0701e91b5a2fc247fd586.
Strike soco404_14bf32e7	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 14bf32e780601c6870811982648cf293.
Strike soco404_229df8da	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 229df8dab03385371464e9a5f3ee89bd.
Strike soco404_2a26af6c	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 2a26af6c46ffb18509397b2ec7f9389a.
Strike soco404_35b66458	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 35b6645859a2fcd674042e284879be11.
Strike soco404_6a267dfa	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 6a267dfa08378eab14650b8d5fd6171.
Strike soco404_71309198	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 713091980135a30a452b34026d949890.

<b>Name</b>	<b>Description</b>
Strike soco404_7feedc2c	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is 7feedc2cd91f037d1bcd285e6f1341b.
Strike soco404_ac00592c	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is ac00592cb93fbb64c26b7f99cfcb80be.
Strike soco404_bb8fbe0f	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is bb8fbe0f257508c78df00252de2fa48c.
Strike soco404_bd8ce6bd	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is bd8ce6bd59b1f648e0ac38e575780453.
Strike soco404_c95ab34d	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is c95ab34d79740f5fa5fdc211c35eb5ea.
Strike soco404_ca125aba	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is ca125aba3e130e2d6a122fcc76461fdc.
Strike soco404_d2226fa9	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is d2226fa9e050f8fd5fe3d4aae27d3406.
Strike soco404_fa904f9d	This strike sends a malware sample known as soco404. soco404 targets Linux and Windows systems with misconfigured PostgreSQL, Apache Tomcat, and other exposed services. It hides payloads within benign seeming fake 404 HTML pages. It uses in memory execution and process masquerading, and aims to mine Monero profitably while avoiding detection. The MD5 hash of this soco404 sample is fa904f9d5abecd5e62645b115f30d971.

Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Binary Tree Encryption-Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Binary Tree Encryption-Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Binary Tree Encryption-Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Binary Tree Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Binary Tree Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Binary Tree Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: OpenAI

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Length Encryption-Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value fashion and sort them lexicographically. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Length Encryption-Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value fashion and sort them lexicographically. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Length Encryption-Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value fashion and sort them lexicographically. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Length Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Length Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Length Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: OpenAI

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with No Encryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. This strike uses a code-style jailbreak template, the embedded prompt is sent in plain text without any encryption or obfuscation. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with No Encryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. This strike uses a code-style jailbreak template, the embedded prompt is sent in plain text without any encryption or obfuscation. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with No Encryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. This strike uses a code-style jailbreak template, the embedded prompt is sent in plain text without any encryption or obfuscation. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Odd-Even Encryption- Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Odd-Even Encryption- Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Odd-Even Encryption- Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Odd-Even Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Gemini

The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Odd-Even Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Reverse Encryption-Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Reverse Encryption-Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Reverse Encryption-Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a code-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Reverse Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Reverse Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Grok

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Code Template with Reverse Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a code-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Binary Tree Encryption-Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Binary Tree Encryption-Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Binary Tree Encryption-Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Binary Tree Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Binary Tree Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Binary Tree Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is binary tree encoding, where the original prompt is structured into a binary tree format. Target LLM: OpenAI

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Length Encryption-Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Length Encryption-Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Length Encryption-Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Length Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Length Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Length Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is based on word length, where we arrange words and their lengths in key-value pair fashion and sort them lexicographically. Target LLM: OpenAI

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with No Encryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. This strike uses a text-style jailbreak template, the embedded prompt is sent in plain text without any encryption or obfuscation. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with No Encryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. This strike uses a text-style jailbreak template, the embedded prompt is sent in plain text without any encryption or obfuscation. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with No Encryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. This strike uses a text-style jailbreak template, the embedded prompt is sent in plain text without any encryption or obfuscation. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Odd-Even Encryption- Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Odd-Even Encryption- Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Odd-Even Encryption- Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Odd-Even Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Gemini

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Odd-Even Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Odd-Even Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is odd-even, where words at odd and even indices are extracted and the two sets are placed one after the other. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Reverse Encryption-Decryption - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Reverse Encryption-Decryption - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Grok
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Reverse Encryption-Decryption - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding its corresponding decryption logic within the instructions. The LLM processes this logic to reconstruct and execute the original query. This strike uses a text-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: OpenAI
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Reverse Encryption Only - Gemini		This strike sends a jailbreak prompt known as CodeChameleon to the Gemini LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Gemini
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Reverse Encryption Only - Grok		This strike sends a jailbreak prompt known as CodeChameleon to the Grok LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: Grok

Name	References	Description
Strike AI LLM CodeChameleon Prompt Injection Using Text Template with Reverse Encryption Only - OpenAI		This strike sends a jailbreak prompt known as CodeChameleon to the OpenAI LLM. The technique involves encrypting the original prompt and embedding it within the instructions. This strike uses a text-style jailbreak template, and the encryption method employed is reverse order, where the order of words in the original prompt is reversed. Target LLM: OpenAI
Strike Apache Struts REST Plugin OGNL Expression Code Execution Vulnerability	CVE: 2016-3087	This strike exploits a code execution vulnerability in Apache Struts. The vulnerability resides in the handleDynamicMethodInvocation() method of the RestActionMapper class when processing OGNL expressions with Direct Method Invocation enabled. A remote attacker can leverage this flaw by sending a crafted HTTP request, allowing arbitrary code execution with the privileges of the server.
Strike Moxa SoftCMS getcaminfo.asp VVID Parameter SQL Injection Vulnerability	CVE: 2016-5792	This strike exploits a SQL injection vulnerability in Moxa SoftCMS. The vulnerability exists due to improper sanitization of user-supplied input in the VVID parameter of the getcaminfo.asp page. A remote attacker could leverage this flaw by sending a specially crafted HTTP request, potentially leading to unauthorized database access, information disclosure, and remote code execution.
Strike Oracle Identity Manager Default Credentials Vulnerability	CVE: 2017-10151	This strike exploits an authentication weakness vulnerability in Oracle Identity Manager. The vulnerability exists due to the presence of default credentials in the WebLogic Server Administration Console and Enterprise Manager interfaces. A remote attacker can leverage this flaw to gain administrator-level privileges on the target system.
Strike HPE Intelligent Management Center FileDownloadServlet Directory Traversal Vulnerability	CVE: 2017-5795	This strike exploits a directory traversal vulnerability in HPE Intelligent Management Center. The vulnerability resides in the FileDownloadServlet due to improper sanitization of the fileName parameter in HTTP GET requests. A remote attacker can leverage this flaw to access and disclose arbitrary file contents from the server.
Strike Advantech WebAccess WADashboard Arbitrary File Overwrite Vulnerability	CVE: 2018-15705	This strike exploits an arbitrary file overwrite vulnerability in Advantech WebAccess SCADA WADashboard. The vulnerability exists due to improper validation of the folderpath parameter in HTTP requests, allowing directory traversal sequences to bypass restrictions. A remote, authenticated attacker can leverage this flaw to write arbitrary files to the server's file system, potentially leading to remote code execution.
Strike Zoho ManageEngine OpManager SQL Injection in Alarms API	CVE: 2018-20338	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the insufficient validation of the "filters" parameter in HTTP requests to the listAlarms API. A remote, authenticated attacker could leverage this flaw by sending crafted HTTP requests containing malicious SQL queries, leading to arbitrary SQL code execution on the application's database.
Strike Schneider Electric IIoT Monitor Server downloadCSV.jsp Directory Traversal Vulnerability	CVE: 2018-7835	This strike exploits a directory traversal vulnerability in Schneider Electric IIoT Monitor Server. The vulnerability exists due to improper validation of the file parameter in requests to the downloadCSV.jsp endpoint. A remote, unauthenticated attacker could leverage this flaw to access and disclose the contents of arbitrary files accessible by the SYSTEM user.

Name	References	Description
Strike Zoho ManageEngine Applications Manager SQL Injection in Popup_SLA.jsp (sid Parameter)	CVE: 2019-11448	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability resides in the improper validation of the "sid" parameter in the Popup_SLA.jsp Java class. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to database manipulation and remote code execution in the context of the application.
Strike HPE Intelligent Management Center Expression Language Injection Vulnerability cve_2019_11943	CVE: 2019-11943	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability resides in the improper validation of the beanName parameter within the SoapConfigBean class. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary code on the target system with SYSTEM-level privileges.
Strike Squid Proxy Digest Authentication Nonce Pointer Disclosure Vulnerability	CVE: 2019-18679	This strike exploits an information disclosure vulnerability in Squid Proxy. The vulnerability resides in the improper construction of the nonce value used in HTTP Digest authentication. A remote attacker could exploit this vulnerability to obtain leaked pointer addresses, potentially bypassing ASLR and facilitating further attacks.
Strike CoDeSys V3 CmpWebServer Heap Buffer Overflow Vulnerability	CVE: 2019-18858	This strike exploits a heap-based buffer overflow vulnerability in the CoDeSys V3 runtime system's web server. The vulnerability arises from improper validation of user-supplied data in the HTTP header "3S-Repl-Content" when processing requests to the /WebVisuV3 endpoint. A remote, unauthenticated attacker can exploit this flaw by sending specially crafted HTTP requests, potentially leading to arbitrary code execution in the context of the server process.
Strike rConfig devices.inc.php SQL Injection Vulnerability	CVE: 2019-19207	This strike exploits an SQL injection vulnerability in the rConfig Network Device Configuration Tool. The vulnerability exists due to improper sanitization of the searchColumn and searchField parameters in the devices.inc.php script. A remote, authenticated attacker can leverage this flaw by sending specially crafted HTTP requests, potentially leading to the execution of arbitrary SQL commands on the database of the target server.
Strike HPE Intelligent Management Center Expression Language Injection Vulnerability	CVE: 2019-5370	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability resides in the IctTableExportToCSVBean class, specifically in the handling of the beanName HTTP request parameter. A remote attacker, after bypassing authentication or using valid credentials, can exploit this flaw by sending a crafted request, leading to arbitrary code execution with SYSTEM-level privileges.
Strike rConfig compliancepolicies.inc.php Unauthenticated SQL Injection Vulnerability	CVE: 2020-10546	This strike exploits a SQL injection vulnerability in the rConfig Network Device Configuration Tool. The vulnerability exists due to insufficient input validation in the compliancepolicies.inc.php script when processing HTTP request parameters. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or access.

Name	References	Description
Strike OpenEMR phpGACL edit_group.php SQL Injection Vulnerability	CVE: 2020-13568	This strike exploits a SQL injection vulnerability in the OpenEMR phpGACL edit_group.php script. The vulnerability arises from improper validation of user-supplied input in the "parent_id" parameter during HTTP POST requests. A remote authenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially leading to the disclosure of sensitive information and further system compromise.
Strike Zoho ManageEngine OpManager Directory Traversal Vulnerability cve_2020_13818	CVE: 2020-13818	This strike exploits a directory traversal vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the improper validation of URI paths within the OpmSkipFilter::doFilter() method. A remote, unauthenticated attacker could leverage this flaw by sending specially crafted requests, potentially leading to arbitrary file read and disclosure of sensitive information on the target server.
Strike Cacti color.php SQL Injection Vulnerability	CVE: 2020-14295	This strike exploits a SQL injection vulnerability in Cacti. The vulnerability exists due to improper sanitization of the "filter" parameter in the color.php script. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to remote code execution on the target server.
Strike Zoho ManageEngine Applications Manager SQL Injection in AlertRes_Mtrgrp.jsp	CVE: 2020-15533	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability exists due to insufficient validation of the "sid" parameter in the AlertRes_Mtrgrp.jsp servlet. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to database manipulation and arbitrary code execution with SYSTEM privileges.
Strike Oracle Business Intelligence AMF Insecure Deserialization Vulnerability	CVE: 2020-2950	This strike exploits an insecure deserialization vulnerability in Oracle Business Intelligence. The vulnerability is located in the handling of AMF3 objects marked as externalizable within the BiRemotingServlet component. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute arbitrary code in the security context of the affected server.
Strike Zoho ManageEngine Applications Manager SQL Injection Vulnerability in UriCollector Class	CVE: 2020-35765	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability resides in the improper validation of the `resourceid` parameter within the `doFilter()` method of the `UriCollector` Java class. A remote, authenticated attacker could leverage this flaw by sending a crafted HTTP request, leading to the execution of arbitrary SQL statements and potentially arbitrary code in the context of the SYSTEM user.
Strike Rockwell Automation FactoryTalk RNADiagnosticsSrv Insecure Deserialization	CVE: 2020-6967	This strike exploits an insecure deserialization vulnerability in Rockwell Automation FactoryTalk Diagnostics. The vulnerability resides in the RNADiagnosticsSrv.exe component, specifically in the OnStart() method, which improperly handles serialized data. A remote, unauthenticated attacker could exploit this vulnerability by sending a maliciously crafted serialized object, leading to arbitrary code execution under the SYSTEM security context.

Name	References	Description
Strike Jenkins Generic Webhook Trigger Plugin XXE Vulnerability	CVE: 2021-21669	This strike exploits an XML External Entity (XXE) vulnerability in the Jenkins Generic Webhook Trigger Plugin. The vulnerability resides in the resolveXPath function, which improperly handles XML data in HTTP POST requests. A remote authenticated attacker with specific permissions could exploit this flaw to access and disclose the contents of arbitrary files readable by the Jenkins server.
Strike Advantech R-SeeNet ping.php Command Injection Vulnerability	CVE: 2021-21805	This strike exploits a command injection vulnerability in Advantech R-SeeNet. The vulnerability exists due to insufficient validation of the "hostname" parameter in the ping.php script. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request, leading to arbitrary command execution with the privileges of the web server on the target system.
Strike Oracle E-Business Suite Sales Offline Infinite Loop Denial of Service Vulnerability	CVE: 2021-2190	This strike exploits an infinite loop vulnerability in the Sales Offline component of Oracle E-Business Suite. The vulnerability is located in the improper handling of HTTP POST requests with a Content-Length header value of 0 in the aslAuthincps.jsp file. Exploiting this vulnerability allows a remote, unauthenticated attacker to cause excessive CPU usage, potentially leading to denial of service conditions on the target server.
Strike Oracle E-Business Suite Knowledge Management Stored Cross-Site Scripting Vulnerability	CVE: 2021-2198	This strike exploits a stored cross-site scripting vulnerability in Oracle E-Business Suite Knowledge Management. The vulnerability resides in the improper sanitization of user-supplied input when handling time period definitions in JSP files. An authenticated attacker with administrative privileges could exploit this flaw to execute arbitrary script code in the browsers of users visiting the affected page.
Strike Advantech iView SQL Injection Vulnerability in ZTPConfigTable	CVE: 2021-22654	This strike exploits a SQL injection vulnerability in Advantech iView. The vulnerability exists due to insufficient validation of user-supplied input in the ZTPConfigTable Java class when processing HTTP request parameters. A remote, unauthenticated attacker could leverage this flaw by sending specially crafted requests, potentially leading to the execution of arbitrary SQL commands, unauthorized data access, or further system compromise.
Strike Eaton IPM Arbitrary File Deletion via Directory Traversal	CVE: 2021-23278	This strike exploits an arbitrary file deletion vulnerability in Eaton Intelligent Power Manager. The vulnerability exists due to insufficient input validation in the handling of HTTP parameters in the maps_srv.js and node_upgrade_srv.js scripts. A remote, authenticated attacker could leverage this flaw to delete arbitrary files on the target system, potentially leading to system compromise.
Strike Eaton Intelligent Power Management Arbitrary File Deletion via Directory Traversal	CVE: 2021-23279	This strike exploits an arbitrary file deletion vulnerability in Eaton Intelligent Power Management. The vulnerability resides in the meta_driver_srv.js script due to insufficient input validation of HTTP request parameters. A remote, unauthenticated attacker can exploit this flaw to delete arbitrary files on the target system, potentially leading to system compromise.

Name	References	Description
Strike Oracle BI Publisher JNDI Injection Vulnerability in SchedulerConfigPage11g	CVE: 2021-2391	This strike exploits a JNDI injection vulnerability in Oracle Business Intelligence Publisher. The vulnerability exists due to insufficient validation of the DB.CFG.JNDIName HTTP request parameter in the SchedulerConfigPage11g class. A remote, authenticated attacker can leverage this flaw by sending a specially crafted request, leading to the execution of arbitrary code on the server through the retrieval of a malicious serialized object.
Strike Oracle Business Intelligence Arbitrary File Upload Vulnerability	CVE: 2021-2392	This strike exploits an arbitrary file upload vulnerability in Oracle Business Intelligence. The vulnerability exists due to insufficient validation of the filename parameter in the UploadFndDBCPage class. A remote, authenticated attacker could leverage this flaw to upload malicious files, potentially leading to privilege escalation or denial of service.
Strike Oracle BI Publisher JNDI Injection Vulnerability in UpdateConnectionServlet	CVE: 2021-2396	This strike targets a JNDI injection vulnerability in Oracle Business Intelligence Publisher. The issue arises from improper sanitization of the JNDINameField parameter in HTTP requests to the UpdateConnectionServlet. A remote, authenticated attacker could exploit this flaw to trigger a JNDI lookup on an attacker-controlled server, potentially leading to the execution of arbitrary code on the affected system.
Strike Apache OFBiz Insecure Deserialization Vulnerability	CVE: 2021-26295	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. The vulnerability arises from improper handling of serialized objects within SOAP requests. A remote, unauthenticated attacker can exploit this flaw by sending a crafted payload, leading to arbitrary code execution on the affected system.
Strike Zoho ManageEngine AD SelfService Plus Command Injection Vulnerability	CVE: 2021-28958	This strike exploits a command injection vulnerability in Zoho ManageEngine AD SelfService Plus. The vulnerability arises from improper sanitization of user-supplied input during password change requests. A remote attacker could leverage this flaw to execute arbitrary commands on the server with the privileges of the web application.
Strike Apache OFBiz Insecure Deserialization Vulnerability cve_2021_30128	CVE: 2021-30128	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. The vulnerability arises from improper validation of serialized objects within the <cus-obj> XML element in SOAP requests. A remote, unauthenticated attacker could leverage this flaw by sending a crafted payload, leading to arbitrary code execution on the affected system.
Strike Apache Tapestry ContextAssetRequestHandler Information Disclosure Vulnerability	CVE: 2021-30638	This strike exploits an information disclosure vulnerability in Apache Tapestry. The vulnerability resides in the ContextAssetRequestHandler class due to insufficient validation of user input when processing asset requests. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request, potentially leading to unauthorized access and retrieval of sensitive files within the WEB-INF directory.

Name	References	Description
Strike Microsoft Visual Studio Code Remote-Containers Extension Remote Code Execution Vulnerability	CVE: 2021-31213	This strike exploits a remote code execution vulnerability in the Remote - Containers Extension for Microsoft Visual Studio Code. The vulnerability resides in the design flaw of the "Clone Repository in Container Volume" feature, which fails to adequately warn users about the risks of cloning untrusted repositories. A remote attacker could exploit this vulnerability by tricking a user into cloning a malicious repository, leading to the execution of arbitrary code with root-level privileges.
Strike SolarWinds Network Performance Monitor Insecure Deserialization Vulnerability	CVE: 2021-31474	This strike exploits an insecure deserialization vulnerability in SolarWinds Network Performance Monitor. The vulnerability resides in the FromJson() method of the SolarWinds.Serialization.Json.SerializationHelper class within the OrionWeb.dll component. A remote, authenticated attacker can leverage this flaw by sending a crafted serialized object to the vulnerable endpoint, leading to arbitrary code execution under the NETWORK SERVICE user context.
Strike Flarum Core Reflected and Stored Cross-Site Scripting Vulnerability	CVE: 2021-32671	This strike exploits a cross-site scripting vulnerability in the Flarum Core application. The vulnerability resides in the translation library, specifically in the preprocessParameters() method of Translators, which fails to properly sanitize HTML markup. Exploiting this vulnerability allows a remote attacker to execute arbitrary script code in the security context of the browser of any user interacting with the affected pages.
Strike Advantech iView runProViewUpgrade Command Injection Vulnerability	CVE: 2021-32930	This strike exploits a command injection vulnerability in Advantech iView. The vulnerability exists due to insufficient input validation in the `fwfilename` parameter of the `runProViewUpgrade` method within the `NetworkServlet` class. A remote, unauthenticated attacker could leverage this flaw by sending a specially crafted HTTP request, leading to the execution of arbitrary commands with SYSTEM-level privileges.
Strike SolarWinds Orion Platform RenderControl.aspx Insecure Deserialization Vulnerability	CVE: 2021-35215	This strike exploits an insecure deserialization vulnerability in the SolarWinds Orion Platform. The vulnerability resides in the RenderControl.aspx endpoint, where user-supplied JSON data is insufficiently validated. A remote, authenticated attacker can leverage this flaw to execute arbitrary code on the target system with NETWORK SERVICE privileges.
Strike SolarWinds Orion Patch Manager Insecure Deserialization Vulnerability	CVE: 2021-35216	This strike exploits an insecure deserialization vulnerability in the SolarWinds Orion Patch Manager Web Console. The vulnerability resides in the handling of the ThwackData parameter within the EditTopXX.aspx endpoint. A remote, authenticated attacker could leverage this flaw by sending a crafted serialized object, leading to remote code execution under the NETWORK SERVICE security context.
Strike OpenSSL SM2 Decryption Buffer Overflow Vulnerability	CVE: 2021-3711	This strike exploits a buffer overflow vulnerability in the OpenSSL library. The vulnerability arises from an incorrect calculation of the plaintext size during SM2 decryption in the sm2_plaintext_size function. A remote attacker can exploit this flaw by sending specially crafted SM2 encrypted data, potentially leading to denial of service conditions.

Name	References	Description
Strike Centreon csv_HostGroupLogs.php SQL Injection Vulnerability	CVE: 2021-37556	This strike exploits an SQL injection vulnerability in the Centreon Web Application. The vulnerability exists due to insufficient input validation of the "start" and "end" parameters in the csv_HostGroupLogs.php script. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or further exploitation.
Strike Centreon generateImage.php SQL Injection Vulnerability	CVE: 2021-37557	This strike exploits an SQL injection vulnerability in the Centreon web application. The vulnerability is located in the generateImage.php script, specifically in the handling of the index parameter within HTTP requests. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or further compromise of the system.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability	CVE: 2021-37918	This strike exploits an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The vulnerability resides in the ModifyPhotoAction class, specifically in the cachePhotosBeforeImport() method, which fails to properly validate the file type of uploaded files. A remote authenticated attacker can leverage this flaw by uploading a malicious file, potentially leading to arbitrary code execution with SYSTEM-level privileges.
Strike Delta Industrial Automation DIAEnergie SQL Injection Vulnerability in HandlerAlarmGroup.aspx	CVE: 2021-38393	This strike exploits an SQL injection vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability is located in the HandlerAlarmGroup.ashx endpoint due to insufficient input validation of the agid parameter. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to code execution with NT SERVICE\MSSQLSERVER privileges.
Strike Zoho ManageEngine OpManager SQL Injection in getDataCollectionFailureReason Method	CVE: 2021-40493	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the getDataCollectionFailureReason method, which fails to properly validate HTTP request parameters such as pollingObject and deviceName. A remote, authenticated attacker could leverage this flaw by sending crafted HTTP requests, leading to the execution of arbitrary SQL commands on the application's database.
Strike Zoho ManageEngine Network Configuration Manager SQL Injection Vulnerability	CVE: 2021-41081	This strike exploits a SQL injection vulnerability in Zoho ManageEngine Network Configuration Manager. The vulnerability is located in the CONFIG_SEARCH_CRITERIA parameter of the configuration search operation, where input is improperly validated. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary SQL commands, potentially compromising the underlying database.
Strike Delta Industrial Automation DIAEnergie Stored Cross-Site Scripting Vulnerability cve_2021_44544	CVE: 2021-44544	This strike exploits a stored cross-site scripting vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability exists due to insufficient input validation in the HandlerEnergyType.ashx endpoint when processing the "name," "kid," and "descr" parameters. A remote attacker can exploit this flaw to execute arbitrary JavaScript code in the context of the victim's browser, potentially leading to unauthorized actions or data exposure.

Name	References	Description
Strike Tiny File Manager Directory Traversal and Arbitrary File Write Vulnerability	CVE: 2021-45010	This strike exploits a directory traversal vulnerability in Tiny File Manager. The vulnerability arises from insufficient validation of the "fullpath" parameter during file upload operations. A remote, authenticated attacker can leverage this flaw to perform directory traversal and arbitrary file write, potentially leading to remote code execution under the web server's security context.
Strike Apache Kylin dumpProjectDiagnosisInfo Command Injection Vulnerability	CVE: 2021-45456	This strike exploits a command injection vulnerability in Apache Kylin. The vulnerability resides in the dumpProjectDiagnosisInfo method due to improper validation of user-supplied project names. A remote authenticated attacker could leverage this flaw by crafting a malicious project name and sending it to the vulnerable REST API endpoint, leading to arbitrary command execution in the context of the server process.
Strike WordPress TI WooCommerce Wishlist Plugin item_id Blind SQL Injection Vulnerability	CVE: 2022-0412	This strike exploits a blind SQL injection vulnerability in the TI WooCommerce Wishlist Plugin for WordPress. The vulnerability exists due to improper sanitization of the user-supplied `item_id` parameter in the `get_wishlist_by_product_id()` function. Exploiting this vulnerability allows a remote, unauthenticated attacker to retrieve arbitrary information from the target database.
Strike Dolibarr ERP-CRM Menu Editor Code Injection Vulnerability	CVE: 2022-0819	This strike exploits a code injection vulnerability in the Dolibarr ERP/CRM software. The vulnerability exists due to insufficient input validation in the "Menu editor" module, specifically in the handling of the "perms" and "enabled" parameters. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary PHP code, potentially leading to remote code execution on the target server.
Strike WordPress Photo Gallery Plugin SQL Injection via filter_tag Parameter	CVE: 2022-1281	This strike targets a SQL injection vulnerability in the Photo Gallery plugin for WordPress. The issue arises from improper sanitization of the "filter_tag" parameter in HTTP requests. Exploiting this flaw allows a remote, unauthenticated attacker to execute arbitrary SQL commands, potentially leading to unauthorized access to sensitive database information.
Strike Pimcore GridHelperService SQL Injection Vulnerability	CVE: 2022-1429	This strike exploits a SQL injection vulnerability in Pimcore. The vulnerability exists due to improper input validation in the /grid-proxy, /get-export-jobs, and /get-batch-jobs APIs. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, potentially leading to unauthorized database access and manipulation.
Strike WordPress Events Made Easy Plugin lang Parameter SQL Injection Vulnerability	CVE: 2022-1905	This strike exploits a SQL injection vulnerability in the Events Made Easy plugin for WordPress. The vulnerability exists due to insufficient sanitization of the "lang" parameter in HTTP requests. A remote, unauthenticated attacker could leverage this flaw to execute arbitrary SQL commands, potentially leading to unauthorized access to sensitive data in the database.

Name	References	Description
Strike Lansweeper AssetActions SQL Injection Vulnerability	CVE: 2022-21210	This strike exploits an SQL injection vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of user-supplied input in the "Mass Edit Assets" functionality. A remote, authenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially gaining unauthorized access to or manipulating the underlying database.
Strike Lansweeper GetAssetsByGroupId SQL Injection Vulnerability	CVE: 2022-21234	This strike exploits an SQL injection vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of user-supplied input in the "order" parameter of the GetAssetsByGroupId function. A remote, authenticated attacker could leverage this flaw by sending a crafted HTTP request, potentially leading to remote code execution under the security context of the database service.
Strike Advantech iView SQL Injection in findTaskMgrItems Parameters	CVE: 2022-2135	This strike targets a SQL injection vulnerability in Advantech iView. The issue arises from insufficient input validation for the "sort_field" and "sort_type" parameters in the "findTaskMgrItems" process. Exploiting this flaw allows a remote, unauthenticated attacker to execute arbitrary SQL commands on the affected server.
Strike Advantech iView SQL Injection in set_useraccount UserName Parameter	CVE: 2022-2136	This strike targets a SQL injection vulnerability in Advantech iView. The issue arises from insufficient input validation of the UserName parameter in the set_useraccount process. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary SQL commands, potentially leading to remote code execution with SYSTEM-level privileges.
Strike Lansweeper HelpdeskSetupActions SQL Injection Vulnerability	CVE: 2022-22149	This strike exploits an SQL injection vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of user-supplied input in the EditSetting() method of the HelpdeskSetupActions component. A remote, authenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially leading to remote code execution under the database service.
Strike H2 Database Console Remote Code Execution via Malformed JDBC URL	CVE: 2022-23221	This strike exploits a remote code execution vulnerability in the H2 Database Console. The vulnerability arises from improper input validation when processing specific JDBC URLs. A remote, unauthenticated attacker can exploit this flaw by sending a crafted request, potentially leading to arbitrary code execution with the privileges of the H2 process.
Strike Parse Server DatabaseController Prototype Pollution Vulnerability	CVE: 2022-24760	This strike exploits a prototype pollution vulnerability in Parse Server. The vulnerability exists due to improper input validation in the DatabaseController when handling JSON data in HTTP POST and PUT requests. A remote, unauthenticated attacker could exploit this vulnerability to inject or modify properties in Object.prototype, potentially leading to denial of service or remote code execution.
Strike WordPress WP Statistics Plugin Stored Cross-Site Scripting Vulnerability	CVE: 2022-25305	This strike exploits a stored cross-site scripting vulnerability in the WordPress WP Statistics plugin. The vulnerability exists due to insufficient input validation of the "ip," "browser," and "platform" parameters in the class-wp-statistics-visitor.php file. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute arbitrary JavaScript code in the context of a user's browser.

Name	References	Description
Strike Studio-42 elFinder Directory Traversal Vulnerability	CVE: 2022-26960	This strike exploits a directory traversal vulnerability in Studio-42 elFinder. The vulnerability exists due to insufficient validation of user-supplied paths in the target and targets parameters. A remote, unauthenticated attacker can leverage this flaw to access files outside the intended web root, potentially leading to arbitrary code execution under the web server's security context.
Strike WWBN AVideo Command Injection via downloadURL Parameter	CVE: 2022-32572	This strike exploits a command injection vulnerability in WWBN AVideo. The vulnerability exists due to insufficient sanitization of the `downloadURL` parameter in HTTP requests. A remote, authenticated attacker could leverage this flaw to execute arbitrary commands on the server, potentially leading to remote code execution.
Strike Advantech iView ConfigurationServlet SQL Injection Vulnerability	CVE: 2022-3323	This strike exploits a SQL injection vulnerability in Advantech iView. The vulnerability is located in the ConfigurationServlet, specifically in the improper validation of the column_value parameter. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute crafted SQL queries, potentially leading to information disclosure.
Strike Trend Micro Mobile Security web_service.dll Path Traversal Vulnerability	CVE: 2023-32521	This strike exploits a path traversal vulnerability in Trend Micro Mobile Security. The vulnerability exists due to improper validation of user-supplied file paths in the web_service.dll component. A remote, unauthenticated attacker could leverage this flaw to delete arbitrary files on the system under the security context of the IIS Anonymous Authentication account.
Strike Splunk Enterprise Arbitrary File Write via XSLT Stylesheets	CVE: 2023-46214	This strike targets an arbitrary file write vulnerability in Splunk Enterprise. The issue resides in the insufficient validation of XSLT stylesheets within the getJobAsset method of the search.py script. Exploiting this vulnerability allows a remote, authenticated attacker to create or overwrite arbitrary files, potentially leading to arbitrary code execution under the context of the Splunk process.
Strike WordPress Royal Elementor Addons Plugin Unrestricted File Upload Vulnerability	CVE: 2023-5360	This strike exploits an unrestricted file upload vulnerability in the WordPress Royal Elementor Addons and Templates plugin. The vulnerability arises from insufficient validation of user-supplied input during file upload processing. A remote attacker can leverage this flaw to upload malicious files, potentially leading to remote code execution within the context of the PHP interpreter.
Strike WordPress Ultimate Member Plugin SQL Injection via Sorting Parameter	CVE: 2024-1071	This strike exploits a time-based blind SQL injection vulnerability in the WordPress Ultimate Member plugin. The vulnerability exists due to improper input validation of the "sorting" parameter in the ajax_get_members() function. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary SQL commands, potentially leading to unauthorized access to sensitive database information.
Strike ConnectWise ScreenConnect InstallExtension Directory Traversal Vulnerability	CVE: 2024-1708	This strike exploits a directory traversal vulnerability in ConnectWise ScreenConnect. The vulnerability exists due to improper validation of file paths within ZIP archives during the extension installation process. A remote attacker could leverage this flaw to execute arbitrary code on the target server by crafting malicious ZIP files.

Name	References	Description
Strike Centreon Web Virtual Metrics SQL Injection Vulnerability	CVE: 2024-55573	This strike exploits an SQL injection vulnerability in Centreon Web. The vulnerability resides in the manageVMetric method of the centreonGraph.class.php script, specifically in the handling of the rpn_function parameter. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to arbitrary SQL command execution on the target database.
Strike Centreon Web updateServiceHost SQL Injection Vulnerability	CVE: 2024-5723	This strike exploits an SQL injection vulnerability in Centreon Web. The vulnerability exists due to insufficient input validation in the updateServiceHost function within the DB-Func.php script. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to the execution of arbitrary SQL commands on the target database.
Strike 427BB Cookie-based Authentication Bypass (login.php)	CVE: 2006-0153 BID: 16178	This strike exploits a cross site scripting flaw in the 427BB web application.
Strike 427BB Cookie-based Authentication Bypass (getvars.php)	CVE: 2006-0153 BID: 16178	This strike exploits a cross site scripting flaw in the 427BB web application.
Strike 427BB showthread.php ForumID Parameter SQL Injection	CVE: 2006-0154 BID: 16169	This strike exploits a SQL injection flaw in the 427B web application.
Strike Microsoft Outlook Security Feature Bypass Vulnerability	CWE: 119 CVE: 2017-11774	This strike exploits a code execution vulnerability in Microsoft Outlook 2010. The vulnerability is due to improper handling of objects in memory or Microsoft Outlook security feature bypass vulnerability. By setting a crafted HTML page as Home Page in Outlook 2010, allows the attacker to execute code in the context of current user. Note: This strike simulates the opening of a malicious page at address defined in Outlook (Home Page).
Strike McAfee Web Reporter JBoss EJBInvokerServlet Marshalled Object Code Execution	CWE: 94 CVE: 2013-4810	This strike exploits in the underlining JBoss component of the McAfee Web Reporter Software. The underlining JBoss application servers is used in many enterprise webapps implementations. A flaw in authorization on the UpdateCertificateServlet class could allow a remote unauthenticated attacker to trigger arbitrary code execution with elevated privileges.
Strike Reprise License Manager HTTP licfile Buffer Overflow		This strike exploits a buffer overflow vulnerability in Reprise License Manager. The vulnerability is due to improper validation of HTTP request licfile parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike WANem v2.3 Unauthorized Remote Root Access	BID: 55485	This strike exploits the Wide Area Network Emulator WANem. By combining a privilege escalation vulnerability with the dosu binary file as setuid root that executes commands supplied as its argument with the ability to inject commands into the pc parameter remotely, a user is able to gain root access remotely.
Strike ACal Cookie Based Authentication Bypass	CVE: 2006-0182	This strike exploits a cookie authentication flaw in the ACal web application.
Strike Domino Web Server Database Access - agentrunner.nsf		This strike attempts to access the /agentrunner.nsf database on a misconfigured Lotus Domino web server.
Strike Apache File Access .htgroup		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .htpasswd		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access httpd.conf		This strike attempts to access an Apache configuration file over HTTP.
Strike Oracle 9i HTTP Server Globals.JSA Access	BID: 4034 CVE: 2002-0562	This strike attempts to access the globals.jsa file that Oracle 9i exposes in the web root.
Strike Oracle 9i HTTP Server mod_plsql Directory Traversal	BID: 3727 CVE: 2001-1217	This strike attempts to exploit a directory traversal flaw in the Oracle 9i mod_plsql module
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 1	BID: 4294 CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 2	BID: 4294 CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 3	BID: 4294 CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 4	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 5	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 6	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 7	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 8	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 9	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 10	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 11	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.
Strike Oracle 9i HTTP Server OWA_UTIL Access Variant 12	BID: 4294  CVE: 2002-0560	This strike attempts to access the OWA_UTIL PL/SQL program through the web interface of the Oracle server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle 9i HTTP Server soapConfig.xml Access	BID: 4290  CVE: 2002-0568	This strike attempts to access the Oracle 9i SOAP configuration file.
Strike Oracle 9i HTTP Server Soap Router Access	BID: 4289  CWE: 264  CVE: 2001-1371	This strike attempts to access the Oracle 9i Soap Router interface. This interface does not enforce authentication in the default configuration.
Strike Oracle 9i HTTP Server Web Administration Access	BID: 4292  CVE: 2002-0561	This strike attempts to access the Oracle 9i web administration interface in a way that bypasses the authentication phase.
Strike Oracle 9i HTTP Server XSQLServlet XSQLConfig.xml Access	BID: 4290  CVE: 2002-0568	This strike attempts to access the Oracle 9i XSQLServlet configuration file.
Strike Apache Stronghold Server Information Disclosure		This strike attempts to access the Apache Stronghold stronghold-info page.
Strike Apache Stronghold Server Status Disclosure		This strike attempts to access the Apache Stronghold stronghold-status page.
Strike Sensitive File Access .svn-entries		This strike attempts to access a Subversion entries file in the web root.
Strike Apache System User Directory Access bin		This strike attempts to access a system user's web directory over HTTP.
Strike Apache System User Directory Access cron		This strike attempts to access a system user's web directory over HTTP.
Strike Apache System User Directory Access root		This strike attempts to access a system user's web directory over HTTP.
Strike Sensitive File Access ws_ftp.log		This strike attempts to access a WS_FTP transfer log file.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Sensitive File Access WS_FTP.LOG		This strike attempts to access a WS_FTP transfer log file.
Strike Apache File Access .www_acl		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .wwwacl		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .wwwgroup		This strike attempts to access an Apache configuration file over HTTP.
Strike Apache File Access .wwwpasswd		This strike attempts to access an Apache configuration file over HTTP.
Strike ACGVclick function.inc.php path Parameter PHP File Include	CVE: 2007-0577  BID: 22278	This strike exploits a PHP include flaw in the ACGVclick web application.
Strike Adobe Acrobat Reader getIcon Memory Corruption (HTTP)	BID: 34169  CWE: 20  CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Actionpoll index.php include Parameter PHP File Include	CVE: 2001-1296  BID: 3383	This strike exploits a PHP include flaw in the Actionpoll PHP voting application.
Strike Actionpoll index.php include_dir Parameter PHP File Include	CVE: 2001-1296  BID: 3383	This strike exploits a PHP include flaw in the Actionpoll PHP voting application.
Strike Active Calendar 1.2 showcode.php page Parameter Local File Include	CVE: 2007-1110  BID: 22704	This strike exploits a local file include vulnerability in Active Calendar 1.2
Strike Active Calendar 1.2 flatevents.php css Parameter XSS	BID: 22705  CVE: 2007-1111	This strike exploits a cross-site scripting vulnerability in Active Calendar 1.2

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Active Calendar 1.2 mysqlevents.php css Parameter XSS	BID: 22705 CVE: 2007-1111	This strike exploits a cross-site scripting vulnerability in Active Calendar 1.2
Strike Active Calendar 1.2 m_4.php css Parameter XSS	BID: 22705 CVE: 2007-1111	This strike exploits a cross-site scripting vulnerability in Active Calendar 1.2
Strike ActiveCampaign 1-2- All Admin Panel Username Parameter SQL Injection	BID: 15400 CVE: 2005-3679	This strike exploits a SQL injection flaw in the ActiveCampaign 1-2-All web application.
Strike ActiveCampaign 1-2- All main.php username Parameter SQL Injection	CVE: 2005-3679 BID: 15400	This strike exploits a SQL injection vulnerability in the username field of 1-2-All
Strike ActivePerl perlIS.dll Filename Overflow Variant 1	CVE: 2001-0815 BID: 3526	This strike exploits a buffer overflow in perlIS.dll in ActivePerl for Microsoft IIS when parsing requests containing a long filename ending in '.pl'.
Strike Activist Mobilization Platform (AMP) base.php base_path Parameter PHP File Include	CVE: 2007-1571	This strike exploits a PHP include flaw in AMP 3.2 and prior.
Strike AdMentor Admin Remote SQL Injection	CVE: 2007-0575 BID: 22281	This strike exploits a remote SQL injection vulnerability in the AdMentor admin page
Strike ADNForum index.php fid Parameter SQL Injection	CWE: 89 CVE: 2006-0123 BID: 16157	This strike exploits a SQL injection flaw in the ADNForum web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe Acrobat AcroPDF.dll loadFile Vulnerability	CVE: 2006-6027 BID: 21155	This strike exploits a memory corruption vulnerability in Adobe Acrobat AcroPDF.dll when passing a long argument to the loadFile method.
Strike Adobe Acrobat AcroPDF.dll setLayoutMode Vulnerability	CVE: 2006-6236 BID: 21813	This strike exploits a memory corruption vulnerability in Adobe Acrobat AcroPDF.dll when passing a long argument to the setLayoutMode() method.
Strike Adobe Acrobat AcroPDF.dll setNamedDest Vulnerability	CVE: 2006-6236 BID: 21813	This strike exploits a memory corruption vulnerability in Adobe Acrobat AcroPDF.dll when passing a long argument to the setNamedDest() method.
Strike Adobe Acrobat AcroPDF.dll setPageMode Vulnerability	CVE: 2006-6236 BID: 21813	This strike exploits a memory corruption vulnerability in Adobe Acrobat AcroPDF.dll when passing a long argument to the setPageMode() method.
Strike Adobe Acrobat AcroPDF.dll src Vulnerability	CVE: 2006-6236 BID: 21813	This strike exploits a memory corruption vulnerability in Adobe Acrobat AcroPDF.dll when passing a long argument to the src method.
Strike Adobe Acrobat getAnnots Remote Code Execution (HTTP)	BID: 34736  CWE: 399  CVE: 2009-1492	This strike exploits a code execution vulnerability in Adobe Acrobat Reader.
Strike Adobe Acrobat Reader newPlayer Remote Code Execution (HTTP)	BID: 37331  CWE: 399  CVE: 2009-4324	This strike exploits a code execution vulnerability in Adobe Acrobat Reader's newPlayer() Javascript method.
Strike Adobe Acrobat and Reader Font Parsing Integer Overflow (HTTP)	CWE: 189  CVE: 2010-2862  BID: 42203	This strike exploits improper parsing of embedded fonts with an integer overflow (CoolType.dll) in Adobe Acrobat and Adobe Reader (PDF) documents which results in a denial of service and potential remote code execution.

Name	References	Description
Strike Adobe Flash DefineSceneAndFrameLabelData Tag NULL Pointer Dereference (Wild 1)	CWE: 189 CVE: 2007-0071 BID: 28695	This strike exploits a NULL pointer dereference vulnerability in the Adobe Flash player that is triggered by a DefineSceneAndFrameLabelData tag containing a malformed SceneCount parameter. This particular exploit is based on a sample found in the wild.
Strike Adobe Flash DefineSceneAndFrameLabelData Tag NULL Pointer Dereference (Wild 2)	CWE: 189 CVE: 2007-0071 BID: 28695	This strike exploits a NULL pointer dereference vulnerability in the Adobe Flash player that is triggered by a DefineSceneAndFrameLabelData tag containing a malformed SceneCount parameter. This particular exploit is based on a sample found in the wild.
Strike Adobe Flash plugin Transparent Object Clickjacking Vulnerability	CWE: 264 CVE: 2013-2866	This strike exploits a vulnerability in the Adobe flash plugin for the Google Chrome Browser on Macintosh OSX. The Flash vulnerability exists in the latest version of Chrome and allows for the victim's webcam's audio/video to be hijacked when handling CSS opacity settings that make the window transparent. Normal use of this plugin would prompt the user to allow or deny use to the requesting ip, but in this case it executes without a prompt.
Strike Adobe Flash Player 10.2.153.1 SWF Memory Corruption	CWE: 119 CVE: 2011-0611 BID: 47314	Adobe Flash Player before 10.2.154.27 on Windows, Mac OS X, Linux, and Solaris and 10.2.156.12 and earlier on Android; Adobe AIR before 2.6.19140; and Authplay.dll (aka AuthPlayLib.bundle) in Adobe Reader 9.x before 9.4.4 and 10.x through 10.0.1 on Windows, Adobe Reader 9.x before 9.4.4 and 10.x before 10.0.3 on Mac OS X, and Adobe Acrobat 9.x before 9.4.4 and 10.x before 10.0.3 on Windows and Mac OS X allow remote attackers to execute arbitrary code or cause a denial of service (application crash) via crafted Flash content, object type confusion, ActionScript that adds custom functions to prototypes, and Date objects; and as exploited in the wild in April 2011. This strike delivers an attack consistent with executing arbitrary code in the context of the user logged in with user interaction by way of visiting a malicious webpage.
Strike Adobe Illustrator CS4 .eps Buffer Overflow (HTTP)	CWE: 119 CVE: 2009-4195 BID: 37192	This strike exploits a vulnerability in the way Adobe Illustrator parses Encapsulated Postscript files containing an overly long strings in a DSC comment, causing a buffer overflow and resulting in possible code execution.
Strike Adobe InDesign Server SOAP Script Execution Lack of Authentication	BID: 56574	Adobe InDesign Server contains a lack of authentication vulnerability. SOAP requests are not authenticated. This allows anyone with access to the SOAP port to execute arbitrary scripts.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe Shockwave Director rcsL Chunk Memory Corruption	CWE: 119 CVE: 2010-3653 BID: 44291	This strike exploits an attack on the undocumented rcsL chunk of Shockwave director files in which setting a 4 byte value in a Director file will overwrite EAX with that value and can lead to remote code execution.
Strike Microsoft Internet Explorer ADODB.Connection Denial of Service	CWE: 20 CVE: 2006-5559 BID: 20704	This strike exploits a denial of service flaw in Microsoft Internet Explorer when instantiating calling the Execute() method of the ADODB Activex control.
Strike Windows URI Handling Arbitrary Command Execution (HTTP)	BID: 10889 CVE: 2004-0636	This strike exploits and overflow in the URI handler for AOL Instant Messenger
Strike AINS function.inc.php path Parameter PHP File Include	CVE: 2007-0570 BID: 22259	This strike exploits a PHP include flaw in the AINS web application.
Strike Akarru main_content.php bm_content Parameter PHP File Include	CVE: 2006-4645 BID: 19870	This strike exploits a PHP include flaw in the Akarru social bookmarking web application.
Strike AlienVault USM and OSSIM fqdn Command Injection	EXPLOITDB : 41884	This strike exploits a command injection vulnerability in the network component of AlienVault. Specifically, when a POST request is made to the fqdn api the host_ip parameter is not properly validated. It is possible to directly pass a command via the host_ip parameter that will get executed in the shell as the root user.
Strike allCineVid Joomla Component id Parameter SQL Injection Vulnerability	CWE: 89 CVE: 2011-0511 BID: 45840	This strike exploits a SQL injection flaw in the allCineVid 1.0.0 Joomla component.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Altnet Download Manager ActiveX Buffer Overflow	CWE: 119 CVE: 2007-5217 BID: 25903	This strike exploits a buffer overflow vulnerability present in the Altnet Download Manager installed by Kazaa and Grokster. Due to an issue involving improper bounds-checking, a malicious web page can cause the Install function to overflow the buffer, leading to system instability and the possibility of remote code execution.
Strike Android 2.0-2.1 Webkit Use-After-Free Remote Code Execution	CWE: 20 CVE: 2010-1807 BID: 43047	This strike exploits a remote code execution vulnerability in WebKit. The flaw occurs when handling floating point data. Remote attacker can use this vulnerability do to code execution on the target system.
Strike Andys PHP KnowledgeBase a_viewusers.php Parameter SQL Injection	CWE: 89 CVE: 2011-1546 BID: 47097	This strike exploits a SQL injection flaw in Andy's PHP KnowledgeBase web application.
Strike AnnoncesV annonce.php page Parameter PHP File Include Variant 1	CVE: 2006-4622 BID: 19854	This strike exploits a PHP include flaw in the AnnonceV web application.
Strike AnnoncesV annonce.php page Parameter PHP File Include Variant 2	CVE: 2006-4622 BID: 19854	This strike exploits a PHP include flaw in the AnnonceV web application.
Strike Anzeigenmarkt 2011 index.php Parameter SQL Injection	CWE: 89 CVE: 2011-1667 BID: 47136	This strike exploits a SQL injection flaw in Anzeigenmarkt 2011 web application.
Strike AOL 9.5 ActiveX AppContext Buffer Overflow		This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the AppContext function.
Strike AOL 9.5 ActiveX DisplayName Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the DisplayName function.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AOL 9.5 ActiveX FinalSavePath Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the FinalSavePath function.
Strike AOL 9.5 ActiveX ForceSaveTo Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the ForceSaveTo function.
Strike AOL 9.5 ActiveX HiddenControls Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the HiddenControls function.
Strike AOL 9.5 ActiveX InitialEditorScreen Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the InitialEditorScreen function.
Strike AOL 9.5 ActiveX Locale Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the Locale function.
Strike AOL 9.5 ActiveX Proxy Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the Proxy function.
Strike AOL 9.5 ActiveX SoapURL Buffer Overflow		This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the SoapURL function.

Name	References	Description
Strike AOL 9.5 ActiveX UserAgent Buffer Overflow	CWE: 119 CVE: 2007-6699 BID: 27026	This strike exploits a buffer overflow in an AOL 9.5 ActiveX control when calling the UserAgent function.
Strike Apache APR_PSPrintf Memory Corruption Vulnerability	CVE: 2003-0245 BID: 7723	This strike exploits a buffer overflow flaw in the Apache HTTP server.
Strike Apache apr-util IPv6 URI Parsing Buffer Overflow 1	CVE: 2004-0786	This strike exploits a vulnerability in the way Apache 2.0.35 - 2.0.50 parses IPv6 URI addresses. An attacker can request a malformed literal address which causes a buffer overflow and could potentially lead to code execution.
Strike Apache apr-util IPv6 URI Parsing Buffer Overflow 2	CVE: 2004-0786	This strike exploits a vulnerability in the way Apache 2.0.35 - 2.0.50 parses IPv6 URI addresses. An attacker can request a malformed literal address which causes a buffer overflow and could potentially lead to code execution.
Strike Apache apr-util IPv6 URI Parsing Buffer Overflow 3	CVE: 2004-0786	This strike exploits a vulnerability in the way Apache 2.0.35 - 2.0.50 parses IPv6 URI addresses. An attacker can request a malformed literal address which causes a buffer overflow and could potentially lead to code execution.
Strike Apache auth_ldap Username Format String	CWE: 134 CVE: 2006-0150 BID: 16177	This strike exploits a format string vulnerability in the Apache webserver auth_ldap module. This strike sends a HTTP basic authorization header that contains a username with format specifier characters and a blank password.
Strike Apache Chunked Encoding Overflow - Apache Nosejob	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the nosejob.c proof-of-concept exploit.
Strike Apache Chunked Encoding Overflow - Apache Nosejob (Evade)	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the nosejob.c proof-of-concept exploit.
Strike Apache Chunked Encoding Overflow - Apache Scalp	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the scalp.c proof-of-concept exploit.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apache Chunked Encoding Overflow - Apache Scalp (Evade)	CVE: 2002-0392 BID: 5033	This strike exploits a buffer overflow flaw in the Apache HTTP server. This strike is based on the scalp.c proof-of-concept exploit.
Strike Apache Continuum Remote Code Execution	EXPLOITDB : 39945	This strike exploits a vulnerability in Apache Continuum. Specifically in versions 1.4.2 and prior, due to the lack of sanitization of user input, it is possible to inject code into the installation.varValue parameter of an HTTP request to the continuum/saveInstallation.action URI. This type of code injection can lead to remote code execution on the target system.
Strike Apache httpd Range Header Memory Exhaustion Denial Of Service	CWE: 399 CVE: 2011-3192 BID: 49303	This strike exploits a denial of service bug in the processing of long range lists in the Apache Web Server. This flaw causes system resource consumption and could lead to instability and denial of service.
Strike Apache Solr Velocity-template Code Execution	EXPLOITDB : 47572 CVE: 2019-17558 CWE: 74	This strike exploits a remote code execution in Apache Solr via Velocity template in the VelocityResponseWriter plugin. When params resource loader is set to true, the user will be allowed to specify the loading of related resources by setting the parameters in the request, this allows the attacker to construct a threatening request on the server. Successful exploitation will result in code execution, in the context of the user running the Apache Solr service.
Strike Apache Struts2 2.1 OGNL Remote Code Execution	BID: 41592 CVE: 2010-1870	This strike exploits a vulnerability present in Apache Struts2 2.1 where a user can encode restricted characters in order to bypass protections put in place to prevent method execution.
Strike Apache Struts2 code execution	CWE: 732 CVE: 2011-3923 BID: 51628	The strike exploits a malicious code execution vulnerability present in apache struts2. The attacker can execute command by sending crafted HTTP request.
Strike Apache Tomcat Hash Collision Denial Of Service	CWE: 399 CVE: 2011-4858 BID: 51200	This strike exploits a denial of service bug in Apache Tomcat when parameters have the same internal hash.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apache Win32 DOS Batch File Arbitrary Command Execution	CVE: 2002-0061 BID: 4335	This strike exploits a remote command execution flaw in the Apache HTTP server. It attempts to run a random command and pipe the results to a file.
Strike Apple Safari PubSubAgent libxml2 Longentity Memory Corruption	CWE: 119 CVE: 2008-3529 BID: 31126	This strike triggers a heap memory corruption vulnerability in Apple Safari PubSubAgent due to the mishandling of long XML entity names by libxml2.
Strike Apple Quicktime for Windows QTPlugin.ocx ActiveX Control SetBgColor Denial of Service	CWE: 119 CVE: 2008-0778 BID: 27769	This strike exploits a denial of service vulnerability in the QTPlugin.ocx Activex control when calling the SetBgColor method.
Strike Apple Quicktime for Windows QTPlugin.ocx ActiveX Control SetHREF Denial of Service	CWE: 119 CVE: 2008-0778 BID: 27769	This strike exploits a denial of service vulnerability in the QTPlugin.ocx Activex control when calling the SetHREF method.
Strike Apple Quicktime for Windows QTPlugin.ocx ActiveX Control SetMatrix Denial of Service	CWE: 119 CVE: 2008-0778 BID: 27769	This strike exploits a denial of service vulnerability in the QTPlugin.ocx Activex control when calling the SetMatrix method.
Strike Apple Quicktime for Windows QTPlugin.ocx ActiveX Control SetMovieName Denial of Service	CWE: 119 CVE: 2008-0778 BID: 27769	This strike exploits a denial of service vulnerability in the QTPlugin.ocx Activex control when calling the SetMovieName method.
Strike Apple Quicktime for Windows QTPlugin.ocx ActiveX Control SetTarget Denial of Service	CWE: 119 CVE: 2008-0778 BID: 27769	This strike exploits a denial of service vulnerability in the QTPlugin.ocx Activex control when calling the SetTarget method.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apple Safari 4.0.4 & Google Chrome 4.0.249 CSS Style Stack Overflow		This strike exploits a denial of service vulnerability in Apple Safari 4.0.4 and Google Chrome 4.0.249 when wrapping an extremely long string inside of a CSS style tag.
Strike Apple Safari Javascript Multibyte Character Escaping DoS		This strike triggers a denial of service in the Apple Safari web browser when handling Javascript that escapes multibyte character strings.
Strike Apple Safari KWQListIteratorImpl () HTML Tag Handling DoS	CVE: 2006-1986 BID: 17634	This strike exploits a denial of service flaw in the Apple Safari web browser.
Strike Apple Safari objc_msgSend_rtp() HTML Tag Handling DoS	CVE: 2006-1987 BID: 17634	This strike exploits a denial of service flaw in the Apple Safari web browser.
Strike Apple Safari for Windows Beta feed --URL DoS Variant 1	BID: 24460	This strike exploits a denial of service flaw in Apple Safari for Windows Beta. This flaw is triggered when the browser attempts to open feed:// urls with special characters.
Strike Apple Safari for Windows file -- URL Denial of Service	CWE: 119 CVE: 2008-2001	This strike exploits a denial of service vulnerability in Apple Safari for Windows when attempting to download a file with a crafted URL.
Strike Apple Safari for Windows document.write Denial of Service	CWE: 119 CVE: 2008-2001	This strike exploits a denial of service vulnerability in Apple Safari for Windows when calling document.write in an infinite loop.
Strike Apple Safari 3.0 for Windows IFRAME SRC Shell Metacharacter Command Execution	CWE: 264 CVE: 2007-3186 BID: 24434	This strike exploits a vulnerability in Apple's Safari browser for Windows by passing shell metacharacters in the SRC attribute of an IFRAME tag using a gopher:// uri.
Strike Apple Safari for Windows URL Spoofing	CVE: 2008-1999	This strike exploits a URL spoofing vulnerability in Apple Safari for Windows and Mac OS X when displaying a page with a crafted URL.

Name	References	Description
Strike Apple Webkit HTML Parsing Rowspan Denial of Service	CWE: 399  CVE: 2007-0342  BID: 22059	This strike exploits a denial of service vulnerability in Apple Webkit when parsing HTML with a large ROWSPAN HTML attribute.
Strike APT-29 Sep 2020 Campaign - WellMess Command and Control		This strike simulates the 'APT-29 Sep 2020 Campaign - WellMess Command and Control' traffic that occurs after executing the WellMess malware.
Strike Arcserve Unified Data Protection EdgeServiceImpl Information Disclosure	CWE: 200  CVE: 2015-4069  BID: 74838	This strike exploits an information disclosure vulnerability in Arcserve Unified Data Protection version 5.0 update 3. The vulnerability is caused by improper validation of user authorization when sending SOAP requests to the EdgeServiceImpl getBackupPolicy and getBackupPolicies methods. A remote, unauthenticated attacker could exploit this by sending crafted requests to the service, resulting in the disclosure of sensitive information such as passwords or encryption keys.
Strike Microsoft IIS ASP Chunked Encoding Heap Overflow	CVE: 2002-0079  BID: 4485	This strike exploits a heap overflow flaw in the chunked encoding transfer mechanism in Microsoft IIS ASP.
Strike ASP.NET Hash Collision Denial Of Service	CWE: 399  CVE: 2011-3414	This strike exploits a denial of service bug in ASP.NET when parameters have the same internal hash.
Strike AssetMan download_pdf.php pdf_file Parameter Directory Traversal	BID: 22921  CVE: 2007-1427	This strike exploits a directory traversal vulnerability in AssetMan
Strike Digium Asterisk Management Interface HTTP Digest Authentication Stack Buffer Overflow	CWE: 119  CVE: 2012-1184  BID: 52815	This strike exploits a buffer overflow vulnerability in the Auth Digest field of the Digium Asterisk Web Management Interface.
Strike Atmosphere Java Framework Reflected Cross Site Scripting		This strike exploits a reflected cross site scripting vulnerability in Atmosphere Java Framework. The vulnerability resides in the JSONP transport method supported by the framework and is due to insufficient sanitization. By exploiting this flaw, an attacker obtains client-side Javascript code execution within victim's browser which can lead to information disclosure and credentials theft.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AWStats awstats.pl configdir Parameter Command Execution	BID: 12298 CWE: 20 CVE: 2005-0116	This strike exploits an arbitrary command execution flaw the AWStats CGI application.
Strike AWStats rawlog Plugin File Disclosure	BID: 10950 CVE: 2005-0435	This strike exploits a file disclosure flaw the AWStats CGI application.
Strike Axis SSI anonymous view RCE	EXPLOITDB : 43984	This strike exploits a command injection vulnerability in Axis SSI camera. If the camera is configured to allow anonymous view, a remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in arbitrary command execution or arbitrary file read.
Strike Barracuda IMG.PL f Parameter Command Execution	BID: 14712 CVE: 2005-2847	This strike exploits an arbitrary command execution flaw the Barracuda CGI application.
Strike Beautifier Core.php BEAUT_PATH Parameter PHP File Include	CVE: 2006-4044 BID: 19873	This strike exploits a PHP include flaw in the Beautifier web application.
Strike Belkin Wemo ChangeFriendlyName XSS	CWE: 79	This strike exploits an XSS code injection vulnerability in the Belkin Wemo application. Specifically it is possible for an attacker to inject code into the ChangeFriendlyName parameter when sending a POST request to the listening basicevent1 service of the Belkin application. The attacker can potentially use this vulnerability to perform various functions like exfiltrating images and GPS tracking, because the Wemo application has been granted access to these services.
Strike Bharat Mediratta Gallery index.php include Parameter PHP File Include	CVE: 2001-1234 BID: 3397	This strike exploits a PHP include flaw in the Bharat Mediratta Gallery.
Strike Bharat Mediratta Gallery index.php include_dir Parameter PHP File Include	CVE: 2001-1234 BID: 3397	This strike exploits a PHP include flaw in the Bharat Mediratta Gallery.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Bharat Mediratta Gallery captionator.php GALLERY_BASEDIR Parameter PHP File Include	CVE: 2002-1412 BID: 5375	This strike exploits a PHP include flaw in the Bharat Mediratta Gallery.
Strike Cross Site Request Forgery Vulnerability in ManageEngine EventLog Analyzer	BID: 74743	This strike exploits a cross site request forgery vulnerability inside ManageEngine EventLog Analyzer. The vulnerability is due to improper userManagementForm.do input validation. An attacker could exploit this vulnerability in order submit requests on the target system with valid user privileges.
Strike Oracle Business Transaction Management SOAP DeleteFileRequest Arbitrary File Deletion	BID: 54870	This strike exploits an arbitrary file deletion vulnerability in Oracle Business Transaction Management Server. A specially crafted SOAP request can be used to delete arbitrary files with System privileges, including system critical files. Successful exploitation can result in data loss or a denial of service condition.
Strike Sinapsi eSolar Light Photovoltaic System Monitor SQL Injection	BID: 55872  CWE: 89  CVE: 2012-5861	This strike exploits SQL injection vulnerabilities in Sinapsi eSolar Light Photovoltaic System Monitor.
Strike Siemens Solid Edge WebPartHelper ActiveX Remote Code Execution Vulnerability	BID: 60158	This strike exploits a remote code-execution vulnerability in SIEMENS Solid Edge. The vulnerability is due to the use of OpenInEditor method within the WebPartHelper ActiveX Control. By enticing a user to open a crafted web page an attacker could remotely execute arbitrary code.
Strike Bit 5 Blog processlogin.php username Parameter SQL Injection	CVE: 2006-0320  BID: 16244	This strike exploits a SQL injection flaw in the Bit 5 Blog web application.
Strike B-net Software Content Management System shout.php name Parameter XSS	CVE: 2006-0078  BID: 16114	This strike exploits a cross site scripting flaw in the B-net Software Content Management System.
Strike Boite de News index.php url_index Parameter PHP File Include	CVE: 2006-4123  BID: 19440	This strike exploits a PHP remote file include flaw in the Boite de News web application.
Strike Microsoft Internet Explorer Frameset Null Pointer Dereference		This strike exploits a Denial of Service in Microsoft Internet Explorer. The vulnerability is triggered when a specific HTML element attribute is set to an unallowed value. By enticing a user to view a malicious web page, an attacker can cause the vulnerable browser to crash. NOTE: The vendor does not intend to issue a patch for this vulnerability.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike CA BrightStor ARCserve Backup r11.5 ActiveX AddColumn Buffer Overflow	CWE: 119 CVE: 2008-1472 BID: 28268	This strike exploits flaw in an ActiveX control that ships with CA Brightstor ARCserve Backup r11.5 that can be triggered by sending an overly long string as the first argument to the AddColumn method resulting in a buffer overflow and potentially leading to arbitrary code execution.
Strike Centreon Web Interface UserAlias Command Execution	EXPLOITDB : 40170	This strike exploits a vulnerability in Centreon Web Interface. The vulnerability is due to how Centreon utilizes the echo command for logging SQL errors. It is possible for an unauthenticated attacker to abuse this functionality to inject and execute commands remotely at the login screen.
Strike CHETCPASSWD System Shadow File Disclosure	CVE: 2002-2219 BID: 6472	This strike exploits a flaw in CHETCPASSWD that discloses the tail end of the system shadow file
Strike Chimera Web Portal System linkcategory.php id Parameter SQL Injection	CVE: 2006-0137 BID: 16113	This strike exploits a SQL injection flaw in the Chimera Web Portal Application.
Strike Chimera Web Portal System modules.php comment_poster Parameter XSS	CVE: 2006-0136 BID: 16113	This strike exploits multiple cross site scripting flaws in the Chimera Web Portal Application.
Strike Chimera Web Portal System modules.php comment_poster_email Parameter XSS	CVE: 2006-0136 BID: 16113	This strike exploits multiple cross site scripting flaws in the Chimera Web Portal Application.
Strike Chimera Web Portal System modules.php comment_text Parameter XSS	CVE: 2006-0136 BID: 16113	This strike exploits multiple cross site scripting flaws in the Chimera Web Portal Application.
Strike Chipmunk Guestbook addentry.php homepage Parameter XSS	CVE: 2006-0069 BID: 16112	This strike exploits a cross site scripting flaw in the Chipmunk Guestbook.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Google Chrome PDF Viewer Use-After-Free (HTTP)	BID: 45788 CWE: 399 CVE: 2011-0475	This strike exploits a use-after-free vulnerability in Google Chrome before 8.0.552.237 and Google Chrome OS before 8.0.552.344 which causes denial of service conditions and possibly other impact by way of a maliciously crafted PDF file. May require user interaction by way of clicking a form button to exhibit malicious conditions.
Strike Cisco Secure ACS LogonProxy.cgi error Parameter XSS	CVE: 2006-3101 BID: 18449	This strike exploits a cross site scripting flaw in the Cisco Secure ACS LogonProxy.cgi application.
Strike Cisco Secure ACS LogonProxy.cgi SSL Parameter XSS	CVE: 2006-3101 BID: 18449	This strike exploits a cross site scripting flaw in the Cisco Secure ACS LogonProxy.cgi application.
Strike Cisco Secure ACS LogonProxy.cgi Ok Parameter XSS	CVE: 2006-3101 BID: 18449	This strike exploits a cross site scripting flaw in the Cisco Secure ACS LogonProxy.cgi application.
Strike Cisco IOS HTTP Authentication Bypass Level 16	CWE: 287 CVE: 2001-0537 BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 17	CWE: 287 CVE: 2001-0537 BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 18	CWE: 287 CVE: 2001-0537 BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 19	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 20	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 21	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 22	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 23	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 24	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 25	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 26	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 27	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 28	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 29	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 30	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 31	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 32	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 33	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 34	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 35	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 36	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 37	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 38	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 39	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 40	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 41	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 42	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 43	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 44	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 45	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 46	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 47	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 48	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 49	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 50	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 51	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 52	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 53	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 54	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 55	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 56	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 57	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 58	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 59	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 60	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 61	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 62	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 63	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 64	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 65	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 66	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 67	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 68	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 69	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 70	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 71	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 72	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 73	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 74	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 75	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 76	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 77	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 78	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 79	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 80	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 81	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 82	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 83	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 84	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 85	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 86	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 87	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 88	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 89	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 90	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 91	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 92	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 93	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 94	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 95	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco IOS HTTP Authentication Bypass Level 96	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 97	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 98	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco IOS HTTP Authentication Bypass Level 99	CWE: 287  CVE: 2001-0537  BID: 2936	This strike attempts to execute arbitrary IOS commands through the HTTP interface of a vulnerable router or switch.
Strike Cisco DCP2100 SADownStartingFrequency Denial of Service		This strike exploits a denial of service vulnerability in Cisco DCP2100 devices. A series of HTTP POST commands can be sent to a vulnerable device to remotely restart the router. These commands can be repeatedly sent to create a denial of service condition.
Strike Cisco SA520W Security Appliance Directory Traversal	EXPLOITDB : 44650	The vulnerability allows attackers read access to arbitrary file contents accessible in the Cisco SA520W Security Appliance server by insufficient validation of user input on requests. Successful exploitation could result in arbitrary file access on the target server.
Strike Cisco WebEx UCF atucfobj.dll ActiveX NewObject Buffer Overflow	CWE: 119  CVE: 2008-3558  BID: 30578	There exists a stack-based buffer overflow in the WebexUCFObject ActiveX control in atucfobj.dll in Cisco WebEx Meeting Manager before 20.2008.2606.4919 which allows remote attackers to execute arbitrary code via a long argument to the NewObject method. This strike delivers a payload via an html page that is consistent with triggering the vulnerable conditions of this ActiveX control method buffer overflow flaw.
Strike citrix XML password buffer overflow	BID: 48898	This strike exploits a stack buffer overflow vulnerability in Citrix XenApp and XenDesktop via XML service.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike citrix XML service request memory corruption	BID: 48898	This strike exploits a memory corruption vulnerability in Citrix XenApp and XenDesktop via XML service. The vulnerability is due to lack of input sanitation. Remote attacker could take advantage of this vulnerability to do code execution attack on the target system.
Strike Clipbucket Arbitrary PHP Code Execution		This strike exploits a file upload vulnerability in Clipbucket web application. The vulnerability is due to improper validation of the user controlled input to the file uploading scripts. By exploiting this vulnerability, a remote, unauthenticated attacker can upload any file including PHP scripts and execute them on the target server. NOTE: When run in one-arm mode, target web application index needs to be available at http://[server].
Strike Clipbucket - Operating System Command Injection		This strike exploits a command injection vulnerability in Clipbucket web application. The vulnerability is due to improper input validation of the "file_name" parameter in HTTP requests to "file_uploader.php" script. By exploiting this vulnerability, a remote, unauthenticated attacker can execute arbitrary OS commands on the target server. NOTE: When run in one-arm mode, file_uploader.php script needs to be available at http://[server]/api/file_uploader.php. Test will create a file named "exploited" in the same location as the vulnerable script.
Strike Code Avalanche inc_listnews.asp CAT ID Parameter SQL Injection	CVE: 2007-1021 BID: 22582	This strike exploits an SQL injection vulnerability in Code Avalanche
Strike Comet WebFileManager CheckUpload.php Language Parameter PHP File Include	CVE: 2006-4077 BID: 19433	This strike exploits a PHP include flaw in the Comet WebFileManager. The checkupload.php script does not properly sanitize the Language variable before use.
Strike CommuniCrypt ActiveX Control Buffer Overflow		This strike exploits a buffer overflow vulnerability inside the CommuniCrypt ActiveX control. If an overly long string is passed to the AddAttachments method a buffer will overflow.
Strike Coppermine Blind SQL Injection	CVE: 2007-1107 BID: 22709	This strike exploits a blind SQL injection vulnerability in the Coppermine Photo Gallery
Strike cPanel 9.1.0-R85 testfile.html email Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike cPanel 9.1.0-R85 erredit.html file Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike cPanel 9.1.0-R85 dnslook dns Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike cPanel 9.1.0-R85 ignorelist.html account Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike cPanel 9.1.0-R85 showlog.html account Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike cPanel 9.1.0-R85 repairdb.html db Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike cPanel 9.1.0-R85 doaddftp.html login Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike cPanel 9.1.0-R85 editmsg.html account Parameter XSS	BID: 10002  CWE: 79  CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike cPanel 9.1.0-R85 del.html ip Parameter XSS	BID: 10002 CWE: 79 CVE: 2004-1875	This strike exploits a cross-site scripting vulnerability in the cPanel remote administration package
Strike CS Chat-r-box csChatRBox.cgi setup Parameter Code Execution	CVE: 2002-1752 BID: 4452	This strike exploits an arbitrary code execution flaw in the csChatRBox website chat application.
Strike CSGuestbook csGuestbook.cgi setup Parameter Code Execution	CVE: 2002-1750 BID: 4448	This strike exploits an arbitrary code execution flaw in the csGuestbook website guestbook application.
Strike CSLiveSupport csLiveSupport.cgi setup Parameter Code Execution	CVE: 2002-1751 BID: 4450	This strike exploits an arbitrary code execution flaw in the csLiveSupport website client support application.
Strike CSNews csNews.cgi setup Parameter Code Execution	CVE: 2002-1751 BID: 4450	This strike exploits an arbitrary code execution flaw in the csNews website news management application.
Strike csSearch csSearch.cgi Arbitrary Command Execution	CVE: 2002-0495 BID: 4368	This strike exploits an arbitrary code execution flaw in the csSearch website search application.
Strike Microsoft Internet Explorer mergeAttribues Property Handling Memory Corruption	CVE: 2007-0945 BID: 23769	Microsoft Internet Explorer contains a memory corruption vulnerability. The mergeAttribues method will copy the attributes, events, and styles from one DOM object to another without validating the type of object passed in. If attributes exist in the source object which do not exist in the destination object, those attributes may write in out-of-bounds memory, resulting in memory corruption. Successful exploitation may result in arbitrary code execution with user privileges or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer cloneNode Dereferenced Pointer Memory Corruption	CWE: 399 CVE: 2007-3903 BID: 26816	Microsoft Internet Explorer contains a memory corruption vulnerability. If an element object is created with no variable referencing it, the memory will be freed during garbage collection. If cloneNode is then called on that object, which contains a pointer to the now freed memory, memory corruption could occur. Successful exploitation could lead to execution of arbitrary code or abnormal termination of Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Ask.com Toolbar activeX Control Buffer Overflow	CWE: 119 CVE: 2007-5107 BID: 25785	This strike identifies a stack buffer overflow in Ask.com Toolbar 4.0.2.53. When passing an overly long string argument to the ShortFormat method of the vulnerable control a stack buffer overflows.
Strike Icona SpA C6 Messenger ActiveX Control File Download and Execute	CWE: 264 CVE: 2008-2551 BID: 29519	This strike executes a vulnerability in Icona SpA C6 Messenger. When the DownloaderActiveX Control propPostDownloadAction parameter is set to run, a remote attacker can download and execute a file via a URL in propDownloadUrl parameter. This strike sends the initial html that contains these parameters before they make an outbound request to receive a malicious file via the propDownloadUrl parameter.
Strike Symantec appstream launchobj ActiveX code execution	CWE: 20 CVE: 2008-4388 BID: 33247	This strike exploits a Symantec appstream client launchobj ActiveX control code execution vulnerability which is due to no confirmation when executing the command in the ActiveX control. Remote attackers may do arbitrary file creation on the target system.
Strike HP Openview Network Node Manager ovlaunch HTTP Request Buffer Overflow	CWE: 119 CVE: 2008-4562 BID: 33668	This strike exploits a buffer overflow vulnerability in HP OpenView Network Node Manager (NMM). The vulnerability is due to insufficient validation of user-supplied data. By sending a specially crafted HTTP request an unauthenticated attacker could potentially execute arbitrary code on the target server.
Strike Free Download Manager torrent File String Buffer Overflow	CWE: 119 CVE: 2009-0184 BID: 33555 EXPLOITDB : 16634	This strike exploits a stack buffer overflow vulnerability in Free Download Manager. Multiple vulnerabilities can be triggered by use of overly long string values. By enticing a user to open a malicious file with the affected software, an attacker could execute arbitrary code.
Strike Orbit Downloader URL Parameter Buffer Overflow	CWE: 119 CVE: 2009-0187 BID: 33894	This strike exploits a buffer overflow vulnerability in Orbit Downloader. Due to improper validation, if a string greater than 472 bytes is passed to the host field in the URL string a stack buffer will overflow.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Novell eDirectory iMonitor HTTP Header Buffer Overflow	BID: 33928 BID: 35666 CWE: 189 CVE: 2009-0192	This strike identifies a vulnerability that exists in Novell eDirectory's iMonitor. Specifically when handling HTTP requests, the Accept-language header is not properly validated, and an overly long string can overflow a buffer causing a denial of service and possibly leading to remote code execution.
Strike Amaya Browser bdo Tag Buffer Overflow	CWE: 119 CVE: 2009-0323 BID: 33046 BID: 33047	This strike exploits a stack overflow vulnerability within Amaya Browser. If an overly long string is sent to the bdo tag the buffer will overflow allowing for the possibility of code execution.
Strike Windows Media Runtime Voice Sample Rate Vulnerability (HTTP)	CWE: 94 CVE: 2009-0555 BID: 36614	This strike exploits a vulnerability parsing the sample rate in ASF-format audio files that use the Windows Media Speech codec
Strike Mozilla Firefox first-letter Memory Corruption	CWE: 399 CVE: 2009-0771 BID: 33990	This strike exploits a Memory Corruption vulnerability in Mozilla Firefox. The vulnerability is due to error while handling svg documents. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike HP Openview rping buffer overflow	CVE: 2009-1420 BID: 35267	This strike exploits a HP Openview rping buffer overflow vulnerability which is due to bad input check the boundary of the length of hostname. Remote attackers may do arbitrary code execution on the target system.
Strike Novell iPrint Client volatile-date-time parameter Buffer Overflow	BID: 37242 CWE: 119 CVE: 2009-1569	This strike exploits a vulnerability that exists in Novell iPrint Client's ActiveX control ienipp.ocx. When the volatile-date-time parameter is passed to the persistance parameter with a string of more than 61 bytes, a stack buffer is overwritten.
Strike Oracle Secure Backup Administration Authentication Bypass <\>	CVE: 2009-1977 BID: 35672	This strike exploits a authentication bypass inside Oracle's secure backup administration application. The vulnerability resides in the php script that handles authentication and is present due to an input validation error

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Secure Backup Administration Property Box Command Injection	CVE: 2009-1978 BID: 35678	This strike exploits a command injection vulnerability inside Oracle's Secure Backup Adminstration web interface. The vulnerability allows command injection by passing malicious URL encoded parameters to property_box.php script
Strike Microsoft Internet Explorer Table Layout Corruption	CWE: 94 CVE: 2009-2531	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when a specific nesting of elements is used for a table layout which leads to a memory corruption.
Strike HP Power Manager Server Login variable Buffer Overflow	CWE: 119 CVE: 2009-2685 BID: 36933	This strike exploits a vulnerability in HP Power Manager Server. If an HTP request is sent to the Login URI the code copies the login variable into a fixed stack buffer of 198 bytes. If a larger amount than this is received it will overwrite critical data.
Strike Mozilla Firefox nsPropertyTable Propertylist Memory Corruption	BID: 36343 CVE: 2009-3070	This strike exploits a vulnerability within Mozilla Firefox. PropertyTable::PropertyList dereferences invalid memory and attempts to execute a corrupted function pointer, and if the position is fixed, height is inherit ,and either -moz-column is assigned memory corruption occurs.
Strike Mozilla Products Javascript String Replace Method Buffer Overflow	BID: 36343 CVE: 2009-3075	This strike exploits a vulnerability within Mozilla Firefox and Seamonkey. If the javascript String Replace method is passed both arguments that match the substring, and that string contains a '\$' character, the replace operation is not performed properly. This causes a large string calculation that results in a buffer overflow.
Strike Mozilla Firefox first-letter Pseudo Element Memory Corruption	CVE: 2009-3382 BID: 36866	This strike exploits a Memory Corruption vulnerability in Mozilla Firefox. The vulnerability is due to error while handling first-letter pseudo elements. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike VMWare Remote Console Format String	CWE: 134 CVE: 2009-3732 BID: 39396	This strike exploits a vulnerability in VMWare's Remote Console program where user controlled values are used for an sprintf call which may include percent modifiers to clobber memory.
Strike HP Openview Network Node Manager ovlogin.exe Buffer Overflow	CWE: 119 CVE: 2009-3846 BID: 37295	This strike exploits a heap buffer overflow vulnerability in HP OpenView Network Node Manager (NMM). The vulnerability is due to insufficient validation of user-supplied data. By sending a specially crafted POST request an unauthenticated attacker could potentially execute arbitrary code on the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP Openview network node manager buffer overflow	CWE: 119 CVE: 2009-3848 BID: 37296	This strike exploits a HP Openview network node manager buffer overflow vulnerability which is due to bad input check the boundary of the parameter template. Remote attackers may do arbitrary code execution on the target system.
Strike HP OpenView Network Node Manager SNMP OID Buffer Overflow	BID: 37261 BID: 37298 BID: 37299 CWE: 119 CVE: 2009-3849	This strike exploits a vulnerability in HP OpenView's Network Node Manager snmp program. The software does not properly validate or handle code passed to the Oid variable in an HTTP request. If this variable's size is greater than the 4096 byte buffer that is allocated the buffer will be overwritten.
Strike Adobe Download Manager getPlus ActiveX Control Buffer Overflow	CWE: 119 CVE: 2009-3958 BID: 37759	This strike exploits a buffer overflow vulnerability in Adobe Download Manager. The vulnerability is due to a stack-based buffer that can be overflowed by sending one or more overlong strings parameter/name value pairs. Remote attackers could exploit the vulnerability by enticing a user to view a malicious web page.
Strike HP Power Manager Directory Traversal	CWE: 22 CVE: 2009-4000 BID: 37873	This strike exploits a vulnerability in HP's Power manager where a user may use a directory traversal exploit to clobber arbitrary files.
Strike HP Openview user ID and password buffer overflow	CWE: 119 CVE: 2009-4176 BID: 37330	This strike exploits a HP Openview user name and password buffer overflow vulnerability which is due to bad input check the boundary of the length of user name and password. Remote attackers may do arbitrary code execution on the target system.
Strike HP OpenView NNM ovwebsnmpsrv Buffer Overflow	CWE: 119 CVE: 2009-4181 BID: 37343	This strike identifies a vulnerability in the ovwebsnmpsrv.exe service of HP OpenView's Network Node Manager. A buffer overflow exists when parsing the sel value of the request. The number of times this value is copied to a stack buffer of 400 bytes is determined by the OvwSelections parameter in the arg value.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Novell eDirectory dhost stack buffer overflow	CWE: 119 CVE: 2009-4653 BID: 37009 BID: 36815	This strike exploits a Novell eDirectory dhost stack buffer overflow vulnerability which is due to bad input check the length of module name in HTTP request. Remote attackers may do arbitrary code execution on the target system.
Strike Novell eDirectory dhost httpstk password buffer overflow	CWE: 119 CVE: 2009-4654 BID: 37042	This strike exploits a Novell eDirectory dhost httpstk passwords buffer overflow vulnerability which is due to bad input check the length of sadminpwd and verifypwd. Remote attackers may do arbitrary code execution on the target system.
Strike Oracle WebLogic Server Node Manager Command Execution	CVE: 2010-0073 BID: 37926	A command execution vulnerability was found in Oracle WebLogic Server's Node Manager. The vulnerability is due to the fact that the resources of Node Manager utility within WebLogic Server can be reached without authentication. Vulnerability can be exploited by sending a specially crafted HTTP request to the process listening on port 5556/TCP. Successful exploitation can result in arbitrary code execution in the context of the running process.
Strike Symantec IM Manager groupList Parameter SQL Injection	CWE: 89 CVE: 2010-0112 BID: 44299	This strike exploits a SQL injection vulnerability in the groupList parameter in the Symantec IM manager. This vulnerability is due to improper sanitization of an HTTP parameter. A remote attacker could exploit vulnerability to execute arbitrary SQL commands on the target system.
Strike Apache Axis2 Admin Account Default Password	CWE: 255 CVE: 2010-0219 BID: 45625	This strike exploits a vulnerability in several applications. Examples include, but are not limited to, SAP BusinessObjects Enterprise XI 3.2, CA ARCserve D2D r15. The vulnerability is caused by the inclusion of Apache Axis2 with default credentials for the administrator. A remote, unauthenticated attacker could use these credentials to access Axis2 using the admin account, bypassing the application's own security mechanisms. Further on, he would leverage other options (such as file upload) in order to upload a crafted web service file and execute code remotely under the SYSTEM account. The strike is implemented targeting CA ARCserve D2D r15. Post-authentication actions are not simulated as they would largely depend on the attacker's own intentions.
Strike Microsoft Internet Explorer Table Layout Column Corruption	CWE: 94 CVE: 2010-0244 BID: 37891	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when column layouts are modified via code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer mergeAttributes Method Memory Corruption	CWE: 94 CVE: 2010-0247 BID: 37893	This strike exploits a vulnerability in Microsoft Internet Explorer. The mergeAttributes method is not properly validated, and when an object uses it with the object as the oSource parameter, the attributes are deleted. The object is then called, and because the attributes have been modified, memory corruption will occur.
Strike Microsoft Internet Explorer Microsoft Data Analyzer ActiveX Code Execution	CWE: 94 CVE: 2010-0252	This strike exploits a vulnerability in the Microsoft Data Analyzer ActiveX control. A use after free error while parsing user interface objects allows the remote attacker to execute arbitrary code on the target system.
Strike Microsoft Internet Explorer Mouse Event Uninitialized Memory	BID: 39023 CWE: 94 CVE: 2010-0267	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when referencing mouse events that haven't been properly initialized.
Strike Viscom Software Movie Player Pro ActiveX Control Buffer Overflow	CWE: 119 CVE: 2010-0356	This strike exploits a buffer overflow in Viscom's Movie Player Pro ActiveX control MOVIEPLAYER.MoviePlayerCtrl.1. The strFontName parameter is not properly validated, and if an overly long string is received it will overflow the buffer.
Strike Microsoft Internet Explorer Reference to Incomplete Element	CWE: 94 CVE: 2010-0490 BID: 39031	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when an element is changed which hasn't been completely defined.
Strike Backdoor IBM Cognos Server	CWE: 255 CVE: 2010-0557 BID: 38084	This strike simulates the use of a backdoor account that is hardwired into IBM's Cognos Server.
Strike Microsoft Internet Explorer Rendering Corruption	BID: 39024 CWE: 94 CVE: 2010-0807	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when handling tags that are improperly nested.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Secure Backup Administration Other Variable Command Injection	CVE: 2010-0899 BID: 41616	This strike exploits a command injection vulnerability inside Oracle's Secure Backup Adminstration web interface. The vulnerability allows command injection by passing malicious URL encoded parameters ("other") to php scripts.
Strike Oracle Secure Backup Administration Authentication Bypass - character	CVE: 2010-0904 BID: 41596	This strike exploits a authentication bypass inside Oracle's secure backup administration application. The vulnerability resides in the php script that handles authentication and is present due to an input validation error
Strike Mozilla Firefox Integer Overflow	CWE: 189 CVE: 2010-1214 BID: 41842	This strike exploits a vulnerability in Mozilla's Firefox where a large number of parameters passed to the Java Runtime Environment leading to a an integer overflow and later to memory corruption.
Strike CA XOsoft multiple Buffer Overflow	CWE: 119 CVE: 2010-1223 BID: 39238	This strike exploits a buffer overflow vulnerability in CA XoSoft production. This vulnerability is due to insufficient boundary checking of parameters while parsing the request. Remote attackers may take advantage of this vulnerability to execute arbitrary code on the target system.
Strike Microsoft Internet Explorer DOM Modification After Release	CWE: 94 CVE: 2010-1259	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when a DOM object is used after it has been released.
Strike Microsoft SharePoint Server Help.aspx Denial of Service	CVE: 2010-1264 BID: 40559	Microsoft Office Sharepoint Services contains a vulnerability in its help.aspx script. By crafting an HTTP request omitting a particular parameter, an attacker can cause a denial of service condition.
Strike RealNetworks Helix Server NTLM Authentication Buffer Overflow	CWE: 119 CVE: 2010-1317 BID: 39490	This strike exploits a vulnerability in RealNetworks Helix Server Products. When handling Base64encoded NTLM Authentication strings of an invalid size, the vulnerable code returns -1 because of a decoding error. This value is then used as a counter to copy data to a heap buffer without validating the error resulting in memory corruption.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Opera Content Length BO	CWE: 189 CVE: 2010-1349 BID: 38519	This strike exploits a buffer overflow vulnerability in Opera 10.10 through 10.50. This vulnerability is due to improper checking content-length value. The attacker can send malicious http response packet with large content-length value lead to buffer overflow.
Strike Safari webkit Remote Code Execution	CWE: 399 CVE: 2010-1392 BID: 40620	This strike exploits a remote code execution vulnerability in Apple Safari. The flaw occurs when handling first-letter attribute in CSS.
Strike Novell iPrint Browser Plugin Buffer Overflow	CWE: 119 CVE: 2010-1527 BID: 42576	This strike exploits a vulnerability that exists in Novell's iPrint Client Browser Plugin. When the call-back-url string is used with op-client-interface-version and result-type set to url, a stack buffer of 200 bytes is allocated for a message string. It is not properly validated, and if an overly long user value is submitted, the buffer is overrun.
Strike HP OpenView Network Node Manager memory Corruption	CWE: 134 CVE: 2010-1550	This strike exploits a vulnerability in HP's OpenView Network Manager where a user-supplied variable is used for a string format which leads to memory corruption.
Strike HP OpenView Network Manager Stack Overflow	CWE: 119 CVE: 2010-1551 BID: 40067	This strike exploits a vulnerability in HP's OpenView Network Manager where a user supplied parameter can overflow a stack buffer.
Strike HP OpenView Network Node Manager act and app Parameter Buffer Overflow	CWE: 119 CVE: 2010-1552	This strike exploits a stack buffer overflow in HP OpenView's Network Node Manager application gennnmdata.exe. A user supplied argument is used to clobber a stack buffer that is a target of sprintf.
Strike HP OpenView Network Node Manager ICount Parameter Buffer Overflow	CWE: 119 CVE: 2010-1554	This strike exploits a stack buffer overflow in HP OpenView's Network Node Manager application gennnmdata.exe. A user supplied argument is used to clobber a stack buffer that is a target of sprintf.

Name	References	Description
Strike HP OpenView Network Node Manager Hostname Overflow	BID: 40072 CWE: 119 CVE: 2010-1555	This strike exploits a vulnerability in HP's OpenView Network Node Manager where a user may supply an overly long hostname to overflow a stack buffer.
Strike VMWare SpringSource Spring Framework class.classloader Code Execution	BID: 40954 CWE: 94 CVE: 2010-1622	This strike exploits a vulnerability in VMWare SpringSource Spring Framework. By abusing the classLoader bean, in a specially crafted request, a remote attacker may achieve arbitrary code execution, by loading a malicious jar file. All versions of SpringSource Spring Framework before 2.5.7 and 3.0.3 are vulnerable to this attack.
Strike Google Chrome Google URL Cross Origin Bypass	CWE: 264 CVE: 2010-1663	This strike exploits a vulnerability within Google's Chrome Browser. Google's URL component does not properly validate URLs that use escape characters, and these characters can allow for insertion of javascript code. In this attack the referenced page's cookie is returned via a javascript alert. With an additional alert from within a body onload event handler the application terminates abruptly.
Strike Apple Quicktime Error Logging Buffer Overflow	CWE: 119 CVE: 2010-1799 BID: 41962	This strike exploits a vulnerability in Apple's Quicktime player when a user controlled string is used to overflow a buffer when logging an error message.
Strike Google Chrome and Apple Safari Webkit Object Outline Memory Corruption	CWE: 119 CVE: 2010-1813 BID: 43078	This strike exploits a vulnerability that exists in Webkit, and is due to the way it handles CSS HTML pages. If the block element contains an inline that has a self painting layer, the code does not check for the correct layer and outlines are mishandled.
Strike Apple Quicktime QTPlugin.ocx plugin invalid pointer	CWE: 824 CVE: 2010-1818	This strike exploits a vulnerability in Apple's Quicktime QTPlugin.ocx plugin where a user supplied pointer is dereferenced without validation.
Strike HP OpenView Network Node Manager Invalid arg	BID: 40637 CWE: 119 CVE: 2010-1960	This strike exploits a stack buffer overflow in HP OpenView's Network Node Manager application jovgraph.exe. A user may supply an overly long argument to a request which clobbers a stack buffer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP OpenView Network Node Manager Sprintf Buffer Overflow	BID: 40638 CWE: 119 CVE: 2010-1961	This strike exploits a stack buffer overflow in HP OpenView's Network Node Manager application jovgraph.exe. A user supplied argument is used to clobber a stack buffer that is a target of sprintf.
Strike Microsoft Internet Explorer Iframe Removal	CWE: 94 CVE: 2010-2556	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when removing an active iframe.
Strike Microsoft Internet Explorer DOM Object Uninitialized Memory Corruption	CWE: 94 CVE: 2010-2557 BID: 42288	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when using the boundElements collection after it has been freed.
Strike Microsoft Internet Explorer Memory Corruption During Layout	CWE: 94 CVE: 2010-2560 BID: 42292	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when trying to adjust layout parameters on a page while it is still being parsed.
Strike Novell Teaming File Upload Directory Traversal	CVE: 2010-2773 BID: 41795	This strike exploits a vulnerability in Novell's Teaming where a user may use a directory traversal exploit to clobber arbitrary files.
Strike Adobe ColdFusion Directory Traversal	CWE: 22 CVE: 2010-2861 BID: 42432	Adobe ColdFusion contains a directory traversal vulnerability. The flaw is due to a lack of input validation by the ColdFusion administration console. A remote unauthenticated attacker could exploit this vulnerability to retrieve arbitrary files, including the password file for the ColdFusion administration console.
Strike Apple CUPS IPP Multiple Value Handling Use After Free	CWE: 399 CVE: 2010-2941 BID: 44530	This strike exploits a use after free vulnerability in Apple Computer Common UNIX Printing System Internet Printing Protocol. When handing certain multi-value parameters with known and unknown strings, memory is not freed properly. This may lead to a use after free condition, which may allow execution of arbitrary code or abnormal termination of the CUPS process.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Squid Proxy Server Expect Empty String Null Pointer Dereference	CVE: 2010-3072 BID: 42982	This strike exploits null pointer dereference vulnerability in Squid Proxy Server. A specially crafted HTTP request with an empty Expect header will trigger a null pointer dereference, leading to abnormal termination of the server process, resulting in a denial of service condition.
Strike Novell iPrint Client debug Parameter Buffer Overflow	CWE: 20 CVE: 2010-3106	This strike exploits a vulnerability that exists in Novell's iPrint Client Browser Plugin. The code does not properly validate the input for the debug parameter. When run, a stack buffer of 0x1FF0 bytes is allocated. If the supplied string is between 0x200 and 0x3FB, a loop will copy more than 1 byte will each iteration through until the stack buffer is overrun and data is overwritten. In this example by triggering the onmousemove event you can slowly watch the buffer fill until it crashes.
Strike Microsoft Internet Explorer Recursive Viewer Corruption of Memory	CWE: 94 CVE: 2010-3326 BID: 43696	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when using a recursively called playStateChange.
Strike Microsoft Internet Explorer Rule Use After Free	CWE: 399 CVE: 2010-3328 BID: 43705	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when removing rules.
Strike Microsoft Internet Explorer Recursive Adding of Elements	CWE: 94 CVE: 2010-3345 BID: 45260	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when recursively adding elements.
Strike Oracle Java Plugin Buffer Overflow	CVE: 2010-3552 BID: 44023	This strike exploits a buffer overflow in Oracle's Java Plugin where a string clobbers a fixed size stack buffer.
Strike Oracle Database Client System Analyzer Arbitrary File Upload	CVE: 2010-3600 BID: 45883	This strike exploits in the Client Analyzer module of Oracle Database 11g. A flaw may allow a remote unauthenticated attacker to upload and execute arbitrary code on vulnerable machine. All version below 11.2.0.1.0 and of Oracle Database 11g and below are vulnerable.

Name	References	Description
Strike RealPlayer CDDA URI Initialization Failure	CWE: 119 CVE: 2010-3747 BID: 44144	This strike exploits an initialization vulnerability within RealNetworks RealPlayer. An overly long string that is passed to the CDDA URI causes an initialization failure, and because this isn't handled properly uninitialized memory is accessed.
Strike Microsoft Unified Access Gateway Cross Site Scripting Vulnerability	CWE: 79 CVE: 2010-3936 BID: 44634	This strike exploits a cross-site scripting vulnerability in Microsoft Forefront Unified Access Gateway (UAG). The vulnerability is due to insufficient validation of user-supplied input in signurl.asp. A remote attacker can exploit this vulnerability by enticing a user to follow a malicious link, which could lead to disclosure of sensitive information, such as web browser authentication cookies or modification of user information.
Strike Microsoft Sharepoint Malformed Request Code Execution Vulnerability	CVE: 2010-3964 BID: 45264	This strike exploits a code execution vulnerability in Microsoft Sharepoint Document Coversion Launcher service. The vulnerability is due to insufficient validation of SOAP requests sent to the service interface. By specially crafting a malicious SOAP request, an unauthenticated attacker could execute arbitrary commands on the server.
Strike IBM Rational Quality Manager Default Account Bypass	CWE: 255 CVE: 2010-4094 BID: 44172	This strike exploits a default credentials vulnerability in IBM Rational Quality Manager. Attacker can use this vulnerability to bypass the authentication on the target system.
Strike HP Power Manager Web Server Stack Overflow	CWE: 119 CVE: 2010-4113	This strike exploits a vulnerability in HP's Power Manager web server where an unauthenticated user can overflow a stack buffer.
Strike Novell ZenWorks Configuration Management File Upload Vulnerability	CWE: 22 CVE: 2010-4229 BID: 47295	This strike exploits a file-upload vulnerability in conjunction with a directory-traversal vulnerability in ZenWorks Configuration Management. These vulnerabilities could allow an unauthenticated attacker to write arbitrary files anywhere on the target system and/or upload and install new web applications. This strike will attempt to upload and install a web application on the target server.
Strike Novell iPrint Client ActiveX control Remote File Deletion	CVE: 2010-4319	This strike exploits a file deletion vulnerability within Novell iPrint Client's ActiveX control. If the CleanupUploadFiles method is called it deletes the files in the zipFilePath parameter without any validation of the parameter. In this attack the folder named removeme will be deleted from C:\.
Strike Oracle GoldenGate Veridata Server XML SOAP Request Buffer Overflow	CVE: 2010-4416 BID: 45868	This strike exploits a buffer overflow vulnerability in the Oracle GoldenGate Veridata Server. The vulnerability is due to failure to properly sanitize user-supplied input data. By crafting an XML SOAP request with an overly long value an attacker could remotely execute arbitrary code on the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Products SVG Text Container Use After Free Condition	CWE: 94 CVE: 2011-0084	This strike exploits a vulnerability within Mozilla Firefox, Seamonkey, and Thunderbird. When the getCharNumAtPosition method is used with properties of its point argument, it is not validated properly. The getter of the x and y properties removes the same SVGTextContentElement that the method is called on, from DOM tree. When later attempts to access this object are performed a Use after Free condition occurs.
Strike Microsoft Windows MHTML Protocol Handler Cross Site Scripting	CWE: 79 CVE: 2011-0096 BID: 46055	This strike exploits a cross site scripting vulnerability in Microsoft Windows. The mhtml handler does not perform sufficient validation, allowing scripting code to be executed. Successful exploitation may result in execution of arbitrary script code.
Strike HP OpenView Network Node Manager parameter overflow	CWE: 119 CVE: 2011-0267 BID: 45762	This strike exploits a vulnerability in HP's OpenView Network Node Manager where a user may supply a large number of variables that will indirectly clobber a fixed buffer.
Strike HP OpenView nnmRptConfig.exe text1 Buffer Overflow	CWE: 119 CVE: 2011-0268 BID: 45762	This strike exploits a vulnerability in HP OpenView's Network Node Manager Service nnmRptConfig.exe. When the text1 parameter is passed values greater than 0x210 bytes, it overflows a buffer.
Strike HP OpenView nnmRptConfig.exe schd_select1 memory corruption	CWE: 119 CVE: 2011-0269 BID: 45762	This strike exploits a vulnerability in HP OpenView's Network Node Manager Service nnmRptConfig.exe. When the schd_select1 parameter is passed values greater than 0x210 bytes, it overflows a buffer.
Strike InduSoft Thin Client InternationalOrder ActiveX Buffer Overflow	CWE: 119 CVE: 2011-0340 BID: 47596	This strike exploits a vulnerability within InduSoft's Thin Client. If an overly long value is supplied to the International Order Property of the ISSYMBOL.ISSymbolCtrl, then that value is converted to a widechar string, and copied to offset 0x2458 overflowing the buffer.
Strike Apache Stack Overflow Recursion	CWE: 399 CVE: 2011-0419	This strike exploits a recursive call flaw on the Apache server which can lead to stack exhaustion. Even without a crash, the server can be unresponsive for some time.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Symantec IM Manager SQL Injection Vulnerability	CWE: 89 CVE: 2011-0553 BID: 49738	This strike exploits a SQL injection vulnerability in Symantec IM Manager. The vulnerability is due to a failure to properly validate parameters in HTTP requests to IMAdminLDAPConfig.asp. A remote attacker could exploit this vulnerability by enticing an authenticated user to view a malicious web page, resulting in execution of arbitrary SQL code against the IM Manager database.
Strike Symantec IM Manager ProcessAction Remote Code Execution Vulnerability	CWE: 94 CVE: 2011-0554 BID: 49742	This strike exploits a code execution vulnerability in Symantec IM Manager. The vulnerability is due to a lack of input validation of HTTP parameters, specifically rdProcess, by the Management Interface. A remote, unauthenticated attacker can exploit the vulnerability by enticing a user to view a malicious webpage, leading to the execution of arbitrary code contained in an file located on a remote share.
Strike Microsoft SharePoint Calendar Cross Site Scripting Vulnerability	CWE: 79 CVE: 2011-0653 BID: 54316	Microsoft Office Sharepoint contains a cross-site scripting (XSS) vulnerability. The vulnerability is due to insufficient validation of the request URL string by the Sharepoint server. An attacker could entice a user to open a malicious URL which could lead to privilege escalation or information disclosure.
Strike CA Internet Security Suite XMLSecDB Arbitrary File Creation	BID: 46539 CVE: 2011-1036	This strike exploits an arbitrary file creation vulnerability in CA Internet Security Suite XMLSecDB ActiveX control.
Strike IBM Tivoli Endpoint Manager POST Buffer Overflow	CWE: 119 CVE: 2011-1220 BID: 48049	This strike identifies a vulnerability in IBM Tivoli's Endpoint Manager. Specifically the vulnerability occurs when an authenticated POST request is made to vulnerable service lcfd.exe. In this strike we achieve this by utilizing a hardcoded user account (OSVDB 72751) to bypass authentication and proceed with overflowing the buffer by sending a large amount of data in the query.
Strike IBM Rational Rhapsody FlashBack FBRecorder Multiple Vulnerabilities	CWE: 94 CVE: 2011-1388 BID: 51184	This strike exploits multiple vulnerabilities attribute to an ActiveX control of the BB Flashback Recorder. If a user opens a specially crafted web page, on a vulnerable machine, arbitrary file access and memory corruption conditions may be triggered using local privileges. All IBM rational Rhapsody verisions prior to 7.6 as well as Blueberry BB FlashBack SDK FBRecorder prior to 2.0.0.214 are affected.
Strike Webkit before Block Use after Free Condition	CWE: 399 CVE: 2011-1440 BID: 47604	This strike exploits a vulnerability within Apple WebKit. When handling ruby elements within a CSS, if used as a counter and its appearance is modified by a display attribute in the CSS after it is defined in the initial CSS, a use after free condition occurs.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle GlassFish Server Administration security bypass	CVE: 2011-1511 BID: 47818	This strike exploits a security bypass vulnerability in Oracle GlassFish server. The vulnerability is due to improper handling trace request. Attacker can use this vulnerability to bypass the authentication on the target system.
Strike Cisco Unified Communications Manager Multiple SQL Injections	CWE: 89 CVE: 2011-1610	This strike exploits an SQL injection vulnerability in Cisco Unified Communications Manager. The vulnerability arises due to the lack of proper sanitation of user supplied arguments to xmldirectorylist.jsp, xmldirectorylist.utf-8.jsp, and xmldirectorylist.other.jsp. An unauthenticated remote attacker can access the vulnerable web service and inject an SQL query into a parameter, thus allowing an attacker to inject and execute arbitrary SQL commands, which can result in disclosure of sensitive information.
Strike CA Total Defense Suite UnassignFunctionalUsers SQL Injection	CWE: 89 CVE: 2011-1653 BID: 47355	This strike exploits a SQL injection vulnerability within CA Total Defense Suite. This vulnerability is due to improper sanitation of a parameter in UnAssignFunctionalRoles. A remote attacker can take advantage of this vulnerability to inject SQL commands.
Strike CA Total Defense Suite credential disclosure	CWE: 310 CVE: 2011-1655 BID: 47356	This strike exploits a code credential disclosure vulnerability in CA Total Defense Suite product. This vulnerability is due to insufficient checking of the access control. A remote attacker can take advantage of this vulnerability to gain the credential information on the target system.
Strike Microsoft Forefront UAG Default Reflected Cross-site Scripting	BID: 44974 CWE: 79 CVE: 2011-1897	This strike exploits a reflected cross-site scripting (XSS) vulnerability in Microsoft Unified Access Gateway. The vulnerability is caused by improper handling of HTTP query strings. This vulnerability can be exploited by an unauthenticated attacker to elevate privileges, inject arbitrary script code, or spoof an identity on a target system.
Strike Microsoft Report Viewer Cross Site Scripting	CWE: 79 CVE: 2011-1976 BID: 49033	This strike exploits a remote cross-site scripting (XSS) vulnerability in Microsoft Report Viewer. The flaw is due to failure to properly validate input passed to the Microsoft Report Viewer control before returning it to the user. This could allow an attacker to craft a malicious URL that could execute arbitrary script code in the context of the browser.
Strike Microsoft Internet Explorer Scroll Use After Free	CWE: 20 CVE: 2011-1993	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when using a scroll region. A region of memory that had been freed is accessed.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Forefront Unified Access Gateway NULL Cookie	CWE: 20 CVE: 2011-2012 BID: 49980	This strike exploits a vulnerability in Microsoft's Forefront Unified Access Gateway where a cookie can be both defined and NULL which leads to a denial of service.
Strike Cisco AnyConnect Load Previous Software	CWE: 20 CVE: 2011-2039	This strike exploits a flaw in Cisco's AnyConnect software where a previous version of the software may be loaded which contains known vulnerabilities. Then an attacker may use vulnerabilities in that software for an attack. Since the attacker can control the file that is downloaded, any arbitrary file can be delivered.
Strike Tom Sawyer GET Extension Object Initialization Memory Corruption	CWE: 119 CVE: 2011-2217 BID: 48099	This strike exploits a memory corruption vulnerability in a TomSawyer ActiveX controls. If activeX control objects created inside a browser memory corruption occurs because they cannot initialize properly.
Strike Oracle Secure Backup Login Command Injection	CVE: 2011-2261 BID: 48752	This strike exploits a vulnerability in the Oracle Secure Backup server where a user may inject some commands into a login statement which is then executed by the server.
Strike HP Easy Printer Care ActiveX Control Directory Traversal	CWE: 94 CVE: 2011-2404 BID: 49100	HP Easy Printer Care Software contains a directory traversal vulnerability. The flaw is due to a lack of input validation by the SaveXML method. An attacker could exploit this vulnerability to create and/or overwrite files, resulting in a denial of service or remote code execution.
Strike Citrix Access Gateway Plugin for Windows CESC ActiveX Buffer Overflow	CWE: 119 CVE: 2011-2592 BID: 54754	Citrix Access Gateway Plug-in for Windows contains a buffer overflow vulnerability. The length of the CSEC http header is not validated. Successful exploitation can allow execution of arbitrary code with privileges of the current user or abnormal termination of ActiveX.
Strike Novell Zenworks LaunchHelp.dll ActiveX Launch Process Command Execution.xml	CWE: 22 CVE: 2011-2657 BID: 50574	The LaunchHelp.dll ActiveX Control that is included with Novell ZENworks Configuration Management and AdminStudio contains an access control weakness that allows remote code execution via the browser.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apple Safari and Google Chrome WebKit Float Use After Free	CWE: 399 CVE: 2011-2790	This strike demonstrates a use after free vulnerability in Apple Safari and Google Chrome's Webkit. When the display style of an element changes from a float to a different kind of positioning, the change may not be carried over to the siblings. The parent object tries to free marked siblings, but does not identify them properly and frees incorrect objects.
Strike Apple Safari Webkit Form Tag Denial of Service	CWE: 119 CVE: 2011-2813 BID: 50066	This strike identifies a vulnerability in Apple Safari Webkit. Specifically, when objects that contain the form= attribute are initialized, associated elements are built with pointers to objects containing virtual pointers. When these pointers are referenced later a denial of service condition occurs.
Strike Apple Safari and Google Chrome Webkit DisplayBox Memory Corruption	CWE: 399 CVE: 2011-2818 BID: 48960	This strike demonstrates a vulnerability in Apple Safari and Google Chrome's Webkit. If a flexbox style is used with children of float style, the element does not verify it's style and considers it a float. This returns uninitialized memory.
Strike Citrix Access Gateway SSL VPN Plugin Remote Code Execution	CWE: 119 CVE: 2011-2882	This strike exploits a buffer overflow in Citrix's Access Gateway SSL VPN Plug-in that causes an arbitrary code execution.
Strike Mozilla Multiple Products Multiple Header Handling	CWE: 94 CVE: 2011-3000 BID: 49849	When sent an HTTP response with multiple location, content-type, content-length, or content-disposition headers, Mozilla Firefox, Thunderbird, and Seamonkey will use the last header. This increases their susceptibility to newline insertion attacks. This strike will always use multiple location headers as a malicious redirect might, but may additionally use multiple content-type, content-length, and content-disposition headers.
Strike CA ARCserve D2D GWT RPC Information Disclosure	CWE: 200 CVE: 2011-3011 BID: 48897	This strike exploits an information disclosure vulnerability in CA ARCserve. A specially crafted Google Web Toolkit Remote Procedure Call request can be sent to the server, which will return various information, including administrator username and password.
Strike KingView 6.5.3 SCADA ActiveX Control Buffer Overflow	CWE: 119 CVE: 2011-3142 BID: 46757	This strike exploits a vulnerability within KingView 6.5.3. When the ValidateUser method is passed an overly large argument, that data is not properly validated, and a buffer is overflowed allowing for the possibility of remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP Data Protector dpnepolicyservice Component LogClientInstallation SQL Injection	CWE: 89 CVE: 2011-3156 BID: 50181	This strike exploits a SQL Injection vulnerability in HP Data Protector. A remote, unauthenticated attacker can execute arbitrary SQL commands against the target server.
Strike HP Data Protector dpnepolicyservice Component GetPolicies SQL Injection	CWE: 89 CVE: 2011-3157 BID: 50181	This strike exploits a SQL Injection vulnerability in HP Data Protector. A remote, unauthenticated attacker can execute arbitrary SQL commands against the target server.
Strike HP Data Protector dpnepolicyservice Component RequestCopy SQL Injection	CWE: 89 CVE: 2011-3158 BID: 50181	This strike exploits a SQL Injection vulnerability in HP Data Protector. A remote, unauthenticated attacker can execute arbitrary SQL commands against the target server.
Strike HP Data Protector dpnepolicyservice Component FinishedCopy SQL Injection	CWE: 89 CVE: 2011-3162 BID: 50181	This strike exploits a SQL Injection vulnerability in HP Data Protector. A remote, unauthenticated attacker can execute arbitrary SQL commands against the target server.
Strike Novell Groupwise Messenger Server Process Memory Information Disclosure	CWE: 200 CVE: 2011-3179 BID: 50443	This strike exploits an error in the Novel Groupwise Messenger Server process, which leads to the disclosure of arbitrary content in memory
Strike Microsoft ASP .NET Forms Authentication Elevation of Privilege	CWE: 264 CVE: 2011-3416 BID: 51201	The Forms Authentication feature in the ASP.NET subsystem in Microsoft .NET Framework 1.1 SP1, 2.0 SP2, 3.5 SP1, 3.5.1, and 4.0 allows remote authenticated users to obtain access to arbitrary user accounts via a crafted username, aka "ASP.Net Forms Authentication Bypass Vulnerability."
Strike Oracle Java Rhino Javascript Error Parsing Vulnerability	CVE: 2011-3544 BID: 50218	This strike exploits a remote code execution vulnerability in Oracle Java. The vulnerability can be exploited by overriding the <code>toString</code> method of the <code>Error</code> class within the Rhino JavaScript Engine. Successful exploitation of this vulnerability could result in the execution of arbitrary Java code on the target system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike TeeChart Professional ActiveX Control Trusted Integer Dereference	CWE: 119 CVE: 2011-4034 BID: 50837	This strike exploits an integer overflow TeeChart ActiveX. The flaw is due to insufficient validation of input to the AddSeries property in the TeeChart ActiveX control. By enticing a user to visit a malicious web page, arbitrary code can be executed on the client system.
Strike HP Network Node Manager OpenView Cross-Site Scripting Vulnerability	BID: 50635 CWE: 79 CVE: 2011-4155	This strike exploits one of five cross-site scripting vulnerabilities in HP OpenView Network Node Manager via HTTP GET request.
Strike HP Network Node Manager Cross-Site Scripting Vulnerability	BID: 50635 CWE: 79 CVE: 2011-4156	This strike exploits one of six cross-site scripting vulnerabilities in HP OpenView Network Node Manager via HTTP POST request.
Strike HP Managed printing Administration jobAcct Remote Command Execution	CWE: 22 CVE: 2011-4166 BID: 51174	This strike exploits a vulnerability in HP Managed Printing Administration web interface. A flaw in the MPAUploader.uploader.1 control, specifically in the UploadFiles function could allow a remote unauthenticated attacker to upload a file under the wwwroot directory. Version 2.6.3 and before are vulnerable.
Strike LibLime Koha Directory traversal and File Upload Vulnerability	CWE: 22 CVE: 2011-4715 BID: 50812	This strike identifies a vulnerability in LibLime Koha that allows for a local file to be uploaded by setting a directory path in the HTTP headers.
Strike HP Easy Printer Care CacheDocumentXMLWithID ActiveX Control Directory Traversal	CWE: 94 CVE: 2011-4786 BID: 51396	HP Easy Printer Care Software contains a directory traversal vulnerability. The flaw is due to a lack of input validation by the CacheDocumentXMLWithId method. An attacker could exploit this vulnerability to create and/or overwrite files, resulting in a denial of service or remote code execution.
Strike Redmine Repository Controller Command Execution	CVE: 2011-4929	This strike exploits a command execution vulnerability in the Redmine repository controller when passing an arbitrary command to the rev parameter.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Nginx NTFS Security Bypass	CWE: 264 CVE: 2011-4963	This strike exploits a security bypass in Nginx when dealing with malformed file name requests.
Strike Microsoft Windows Anti-Cross Site Scripting Library XSS	CWE: 79 CVE: 2012-0007 BID: 51291	This strike exploits a remote cross site scripting flaw in Microsoft Windows Anti-Cross Site Scripting Library.
Strike Microsoft Internet Explorer Information Disclosure	CWE: 200 CVE: 2012-0012 BID: 51932	This strike exploits a vulnerability in Microsoft Internet Explorer where local memory can be disclosed which may contain passwords.
Strike Microsoft Internet Explorer VML Use After Free CVE 2012-0155	CWE: 94 CVE: 2012-0155 BID: 51935	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when removing objects described in the Vector Markup Language (VML).
Strike Microsoft Internet Explorer Select All Use After Free	CWE: 94 CVE: 2012-0171 BID: 52905	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when a select-all operation uses an object after it has been freed.
Strike IBM SPSS SamplePower ActiveX Remote File-System Access	CVE: 2012-0189	This strike exploits a vulnerability in IBM SPSS SamplePower ActiveX control allowing for arbitrary file-system read and write operations.
Strike IBM Tivoli Provisioning Manager Express for Software Distribution Buffer Overflow	CVE: 2012-0198	This strike exploits a vulnerability in IBM Tivoli Provisioning Manager Express for Software Distribution; a buffer overflow in RunAndUploadFile() method allows for arbitrary remote code execution.
Strike IBM Tivoli Provisioning Manager SQL Injection	CWE: 89 CVE: 2012-0199	This strike exploits an SQL Injection in IBM Tivoli Provisioning Manager where an attacker can update underlying data. In particular, a user may upgrade their account to an administrator.

Name	References	Description
Strike Advantech WebAccess HMI and SCADA Software Cross-Site Scripting	CWE: 79 CVE: 2012-0233 BID: 57178	This strike exploits a cross-site scripting vulnerability in Advantech WebAccess. The vulnerability is due to the improper sanitization of user input when creating a new project. An attacker could exploit this vulnerability by creating a project with a malicious description - any user subsequently viewing the project would have have code executed on their machine in the context of the browser.
Strike Broadwin WebAccess Client Bwocxrund ActiveX OcxSpool Format String	CWE: 134 CVE: 2012-0242 BID: 57178	This strike exploits a format string vulnerability in Broadwin WebAccess ActiveX control. The vulnerability is due to the improper sanitization of the OcxSpool method. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim machine in the context of the user.
Strike NTR ActiveX Control StopModule() Remote code execution	CWE: 20 CVE: 2012-0267 BID: 51374	This strike exploits a vulnerability in the NTR ActiveX suite. Specifically, due to improper handling of parameters in the StopModule() method, a memory corruption can be triggered that leads to code execution. All versions before 2.0.4.8 are vulnerable.
Strike Linksys PlayerPT ActiveX control sUrl Parameter Buffer Overflow	BID: 54588 CWE: 119 CVE: 2012-0284	This strike identifies a buffer overflow vulnerability in Linksys' ActiveX control, PlayerPT. Improper validation occurs when handling the sUrl parameter, and an overly large user supplied value will overflow the buffer that is allocated on the stack for the parameter.
Strike Symantec Web Gateway timer.php XSS	CWE: 79 CVE: 2012-0296 BID: 53396	This strike exploits a cross site scripting vulnerability in Symantec Web Gateway Management Console.
Strike apache struts2 cookie OGNL command execution	CWE: 264 CVE: 2012-0392	This strike exploits a command execution vulnerability in Apache struts2. This vulnerability is due to no input check the cookie names. Remote attackers may do arbitrary code execution on the target system.
Strike Oracle AutoVue ActiveX control Buffer Overflow	BID: 53077 CVE: 2012-0549	This strike exploits a vulnerability in Oracle AutoVue Enterprise Visualization software. When a string is passed to the SetMarkupMode method with a size greater than 0x100, that string is copied from heap memory into an allocated stack buffer without validation.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle GlassFish XSS	BID: 53136  CVE: 2012-0551	This strike exploits a cross site scripting flaw in the Oracle GlassFish. The remote attacker could use this vulnerability to do code execution attack in the target system.
Strike Apple Quicktime Plugin SetLanguage Buffer Overflow	CWE: 119  CVE: 2012-0666  BID: 53577	Apple QuickTime Plugin contains a buffer overflow vulnerability. The length of the SetLanguage parameter is not verified, and thus can be exploited to execute arbitrary code or crash the plugin/browser.
Strike IBM Rational ClearQuest CQOLE ActiveX Remote Code Execution	BID: 53170  CWE: 119  CVE: 2012-0708	This strike that exploits IBM's Rational ClearQuest CQOLE ActiveX controls RegisterSchemaRepoFromFileByDbSet() method; a function prototype mismatch allows remote attacker to control the returned function pointer.
Strike Tiki Wiki PHP Unserialize Code Execution	CWE: 94  CVE: 2012-0911  BID: 54298  EXPLOITDB : 19573  EXPLOITDB : 19630	This strike exploits a code execution vulnerability in Tiki Wiki. Certain configurations of Tiki Wiki will allow writing of arbitrary PHP code via the printpages parameter of the tiki-print_multi_pages script. A specially crafted HTTP request can write and call arbitrary PHP code, resulting in arbitrary code execution.
Strike LANDesk ThinkManagement Suite ServerSetup.asmx Directory Traversal	CWE: 264  CVE: 2012-1195  BID: 52023	This strike exploits a directory traversal vulnerability in the LANDesk ThinkManagement Suite allowing arbitrary file creation and command execution.
Strike LANDesk ThinkManagement Arbitrary File Deletion	BID: 52023  CWE: 22  CVE: 2012-1196	This strike exploits a weakness in the LANDesk ThinkManagement Suite where an arbitrary file may be deleted.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike D-link DSL-2640B Router Admin password change	BID: 52096 CWE: 352 CVE: 2012-1308	This strike exploits a vulnerability in D-Link DSL-2640B Router's web interface which listens on port 80. You are able to change router parameters as well as the administrator's password
Strike WebCalendar settings.php Code Injection and Remote Code Execution	CVE: 2012-1495	This strike identifies a vulnerability inside WebCalendar version 1.2.4 and prior. There exists a code injection and modification vulnerability by which modifications made to the settings.php script are possible because they are not properly validated. Updating this script will allow the attacker to execute code remotely.
Strike Microsoft Internet Explorer Layout Object Use After Free	CWE: 119 CVE: 2012-1526 BID: 54950	This strike exploits a vulnerability within Microsoft Internet Explorer. The vulnerability exists within the layout engine, and when an invalid object is contained by elements that have a large negative margin value , a CTreeNode object can be destroyed. This results in a use-after-free error when trying to access that object later and possibly memory corruption.
Strike Oracle WebCenter Forms Recognition ActiveX Code Execution	CVE: 2012-1709	This strike exploits a vulnerability in the Oracle WebCenter Forms Recognition ActiveX control. A lack of path validation in Save() method allows the remote attacker to potentially execute arbitrary code.
Strike Oracle WebCenter Forms Recognition ActiveX Control Code Execution	CVE: 2012-1710	This strike exploits a vulnerability in the Oracle WebCenter Forms Recognition ActiveX control. A lack of path validation in SaveLayout() method allows the remote attacker to potentially execute arbitrary code.
Strike PHP CGI Command Execution	CWE: 20 CVE: 2012-1823	This strike exploits a vulnerability in PHP framework, more specifically how CGI scripts is handled. By improper input escaping, malicious php.ini directives can be supplied to the php executable and any arbitrary script can be interpreted and executed on the server. All versions of PHP prior to 5.3.12 and 5.4.2 are vulnerable.
Strike Microsoft SharePoint Reflected List inplnview Parameter Cross Site Scripting Vulnerability	CWE: 79 CVE: 2012-1863 BID: 54316	Microsoft Office Sharepoint contains a cross-site scripting (XSS) vulnerability. The vulnerability is due to insufficient validation of the list parameters passed to the inplnview.aspx page.
Strike Microsoft Internet Explorer Table Element Row Insertion Memory Corruption	CWE: 94 CVE: 2012-1880	This strike exploits a vulnerability that exists in Microsoft Internet Explorer. If the methods getClientRects(), or getBoundingClientRect() are used to call Table elements, and then a row is inserted into those element that contain a caption, memory corruption occurs.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft ActiveX Objects Cachesize Memory Corruption	CWE: 119 CVE: 2012-1891	This strike demonstrates the vulnerability within Microsoft ActiveX Data Objects. When creating a recordset from an XML data island, a heap buffer is allocated based on the CacheSize property. This code is not properly validated, and if the value is large enough a NULL pointer is returned as a pointer for a different array.
Strike Mozilla Firefox Thunderbird and Seamonkey Table Memory Corruption	BID: 54578 CWE: 399 CVE: 2012-1952	This Strike exploits a vulnerability in the Mozilla products, Firefox, Thunderbird, and Seamonkey. An object casting mismatch occurs when handling a mixed assortment of columns and rows within a table. If a col based frame is received first followed by a row element, the object type is not verified, and the code is mistakenly viewed as a column group.
Strike IMB Lotus Notes URL handling command execution	CWE: 94 CVE: 2012-2174 BID: 54070	IBM Lotus notes has a command execution vulnerability. If a notes: URI containing the strings "-RPARAMS" followed by "-vm" is accessed, arbitrary remote code could be executed.
Strike IBM Lotus iNotes ActiveX Control Attach_Times Buffer Overflow	CWE: 119 CVE: 2012-2175	This strike exploits a vulnerability in IBM Lotus iNotes ActiveX control. If the General_Mode property is equal to 1 the Attachment_Times property is parsed as date time strings. This is stored in a 0x200 byte stack buffer, and if the string too large it will write into it.
Strike IBM Lotus Quickr QuickPlace ActiveX Control Remote Code Execution	BID: 53678 CWE: 119 CVE: 2012-2176	This strike exploits a vulnerability in the IBM Lotus Quickr QuickPlace ActiveX control. Lack of boundary checking causes a string copy in either Attachment_Times or Import_Times properties to write past the end of a buffer.
Strike GE Proficy Historian ActiveX Remote Code Execution	CWE: 78 CVE: 2012-2516	This strike exploits a vulnerability within GE Proficy Historian's ActiveX control KeyHelp.ocx. Specifically while using the LaunchTriPane method to run a chm file using hh.exe, the method fails to validate the parameters when passed the decompile option. This parameter can be passed a remote UNC path as the location of the stored chm file to be decompiled to a specified directory on the local machine. This strike demonstrates what would happen by calling a locally stored chm file on a windows machine to be decompiled to the C:/ directory. The path of the locally stored (safe) chm in this demonstration would be replaced by the remote UNC path and malicious chm file
Strike Microsoft Internet Explorer CSS Mailto Use After Free Condition	CWE: 94 CVE: 2012-2521	This strike exploits a vulnerability a Use After Free condition in Microsoft Internet Explorer. If a mailto URL is passed as a src parameter in the CSS font-face rule of the CSS style, a dialog box will be launched by a DOM object trying to access the font. If this object is then later destroyed, a UAF condition occurs when an event handler tries to access it.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer JScript and VBScript Integer Overflow	CWE: 189 CVE: 2012-2523	This strike exploits a vulnerability in the Microsoft JavaScript and VBscript engines. An integer overflow exists when handling strings. The code extends the 32bit value to a 64bit value and this is used as the size parameter when calling memcpy. If a string greater than 0x80000000 is passed in as this parameter an integer overflow occurs which leads to memory corruption.
Strike Microsoft System Center Configuration Manager Cross Site Scripting	BID: 55430 CWE: 79 CVE: 2012-2536	This strike exploits a reflected cross-site scripting (XSS) vulnerability in Microsoft System Center Configuration Manager. The vulnerability is caused by lack of input validation when handling HTTP requests. This vulnerability can be exploited by an attacker to execute malicious code in the context of the victim user's browser.
Strike Symantec Web Gateway blocked.php Blind SQL Injection	CWE: 89 CVE: 2012-2574 BID: 54424	This Strike exploits Symantec Web Gateway with a blind SQL injection in blocked.php. The strike will attempt to create a new user in the database.
Strike Ruby on Rails Where Hash SQL Injection	BID: 53970 CWE: 89 CVE: 2012-2695	This strike exploits a SQL injection vulnerability Ruby on Rails. The vulnerability results from a lack of input validation while handling hash values. A remote attacker could exploit this vulnerability by sending malicious SQL code.
Strike Symantec Web Gateway pbcontrol.php RCE	CWE: 78 CVE: 2012-2953 BID: 54426	This strike exploits pbcontrol.php in Symantec Web Gateways, which fails to correctly check the filename parameter before using it in an exec call. No authentication is needed.
Strike Symantec Web Gateway languageTest.php Root RCE	CWE: 264 CVE: 2012-2957 BID: 54429	This strike exploits web-server logs and a bug in languageTest.php in Symantec Web Gateway to execute code as root.
Strike Webmin show.cgi URI Path Command Execution	CVE: 2012-2982 BID: 55446	This strike exploits a vulnerability in Webmin. If the URI portion of the show.cgi command contains a correctly placed pipe character " ," the URI will run as a shell command at root level. Successful exploitation will allow for command execution at root level.

Name	References	Description
Strike Trend Micro Control Manager ad hoc query Module SQL Injection	CWE: 89 CVE: 2012-2998	This strike exploits an SQL injection vulnerability in Trend Micro Control Manager. The vulnerability is due to a insufficient sanitization of input when handling parameters to the AdHocQuery_Processor.aspx page. Specifically the id parameter is used, unsanitized, to build an SQL query. If the parameter value contains a single quote ('), the literal id value will be terminated and any SQL code following will be added to the constructed SQL query that is executed by the Control Manager server. An attacker can exploit this vulnerability by sending a specially crafted request to the AdHocQuery_Processor.aspx page with an id parameter injecting SQL code. Successful exploitation could result in arbitrary execution of SQL queries with DB Administrator privileges.
Strike Oracle Reports Developer URLPARAMETER remote execution	BID: 55955 CVE: 2012-3152	This strike exploits a vulnerability in the Oracle Reports Developer Software suite. Specifically the vulnerability allows posting random javascript inside the executable path of the server and eventually achieve code execution. All versions of Oracle Fusion Middleware 11.1.1.4, 11.1.1.6, and 11.1.2.0 are vulnerable to this attack.
Strike Oracle Reports Developer PARSEQUERY information disclosure	CVE: 2012-3153 BID: 55961	This strike exploits a vulnerability in the Oracle Reports Developer Software suite. Specifically, when using the PARSEQUERY functionality inside the rw servlet , a malicious user could potentially manipulate the system into divulging database usernames and passwords. All versions of Oracle Fusion MiddleWare 11.1.1.4, 11.1.1.6 and 11.1.2.0 are vulnerable to this attack.
Strike HP SiteScope SOAP Call Remote Arbitray File Access	CVE: 2012-3259 CVE: 2012-3260 BID: 55269	This strike exploits one of two security bypass vulnerabilities in HP SiteScope. The vulnerability is due to lack of proper access control by the APIMonitorImpl web service, using the getFileInternal and loadFileContent functions. Remote, unauthenticated users can exploit these vulnerabilities to read arbitrary system files.
Strike HP SiteScope SOAP Call APIPreferenceImpl Multiple Security Bypass	CVE: 2012-3261 BID: 55269	This strike exploits a security bypass vulnerability in HP SiteScope. The vulnerability is due to lack of authentication checking by the SOAP Call API. Remote, unauthenticated users can create new users as well view plaintext credential information simply by sending a well-formed SOAP request.
Strike HP SiteScope Multiple Directory Traversal Vulnerabilities	CVE: 2012-3264 BID: 55273	This strike exploits a directory traversal vulnerability in HP SiteScope. The vulnerability is due to insufficient validation of user-supplied input by Upload/Download manager servlets while processing http requests. A remote attacker could exploit the vulnerability to download, or upload and execute, arbitrary files to/from the target server via relative or full directory paths.
Strike Zend Technologies Zend Framework Zend_XmlRpc SimpleXMLElement Information Disclosure	CVE: 2012-3363 BID: 54192	This strike exploits an information disclosure vulnerability in Zend Technologies Zend Framework. A user can POST a crafted XML file and receive content of arbitrary files.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apache x-forwarded-for Denial of Service in mod_rpaf	BID: 55154  CVE: 2012-3526	This strike exploits a denial of service flaw in Apache's mod_rpaf module when presented with an invalid x-forward-for tag. Note that Apache's thread model and restart capabilities may somewhat mask the observable behavior of this exploit.
Strike Apple Safari 5.1.7 And Prior Title Memory Corruption	BID: 55534  CVE: 2012-3684	This strike exploits a memory corruption vulnerability in Safari 5.1.7 and before (both desktop and mobile).
Strike Apple Quicktime Plugin Content-Type Header Buffer Overflow	CWE: 119  CVE: 2012-3753  BID: 56438	Apple QuickTime Plugin contains a buffer overflow vulnerability. The length of the Content-Type parameter is not verified, and thus can be exploited to execute arbitrary code or crash the plugin/browser.
Strike Apple Quicktime Player ActiveX Control Code Execution Vulnerability	CWE: 399  CVE: 2012-3754  BID: 56438	This strike exploits a vulnerability in Apple Quicktime Player's QTplugin. Specifically a use-after-free error condition occurs when the clear method is called. The code frees an internal object that can be referenced by Internet Explorer later.
Strike Samsung Kies Arbitrary Command Execution	CVE: 2012-3807	This strike exploits an input validation error in Samsung Kies ActiveX controls that allows for an arbitrary command execution.
Strike Avayas IP Office Customer Call Reporter Unrestricted File Upload	CVE: 2012-3811  BID: 54225	This strike exploits a flaw in Avaya's IP Office Customer Call Reporter where an unauthenticated user can upload an arbitrary file.
Strike Mozilla Firefox WAV Processing Heap Overflow	CWE: 119  CVE: 2012-4186  BID: 56135	This strike exploits a Memory Corruption vulnerability in Mozilla Firefox. The vulnerability is due to error while processing wav files. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, possibly leading to execution of arbitrary code on the victim machine.
Strike Mozilla Firefox Cross Domain Information Disclosure	CWE: 264  CVE: 2012-4192	This strike exploits a vulnerability in Mozilla Firefox. This vulnerability violates the same origin policy which prevents a document or script loaded from one origin from getting or setting properties of a document from another origin. This document can read the property of the window object with a different origin, which leads to the disclosure of the URL information for that window object.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike WordPress Plugin Quick Post Widget 1.9.1 Cross-site scripting	CWE: 79 CVE: 2012-4226 BID: 54311	WordPress Quick Post Widget plugin contains multiple cross-site scripting vulnerabilities.
Strike Symantec Messaging Gateway Information Disclosure	CWE: 22 CVE: 2012-4347 BID: 56789	This strike exploits one of two directory traversal vulnerabilities exist in Symantec Messaging Gateway. The vulnerabilities are cause by improper validation of user-supplied input, specifically HTTP parameters. A remote attacker could exploit these vulnerabilities to download arbitrary system files.
Strike Java Sandbox Breach	BID: 55213 CVE: 2012-4681	This strike demonstrates an exploit in Java where an attacker can run arbitrary Java code without sandbox protection.
Strike Microsoft Internet Explorer HTML Style Property Reference Counting Use After Free	CWE: 399 CVE: 2012-4787 BID: 56830	Microsoft Internet Explorer contains a use after free vulnerability. When handling HTML styles, if the style property of an object is not supported by Internet Explorer, the object is not properly added to the Document Object Model. After the object is deleted, a use after free condition occurs due to improper reference counting. Successful exploitation may result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Asus Net4Switch ActiveX control Buffer Overflow	CWE: 119 CVE: 2012-4924 BID: 52110	This strike exploits a vulnerability within Asus' Net4Switch ActiveX control ipswcom.dll. This vulnerability exists within the alert and msgbox methods. When a string is passed to either of these it is not properly validated, and if it is larger than 0x7D0 bytes it will overflow the buffer when copied into it.
Strike Novell ZENWorks Asset Management Backdoor User and Password	CWE: 255 CVE: 2012-4933	This strike exploits a backdoor username and password in Novell's ZENWorks Asset Management. This account is hardcoded into the source and cannot be disabled.
Strike Novell File Reporter FSFUI Arbitrary File Retrieval	CWE: 22 CVE: 2012-4958	This strike exploits a file retrieval vulnerability in Novell File Reporter. The vulnerability is caused by insufficient authentication when handling FSFUI requests. An remote unauthenticated attacker could exploit this vulnerability by sending a specially crafted request to the server. Successful exploitation could result in arbitrary file retrieval with SYSTEM privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Java Sandbox Breach via Glassfish	CVE: 2012-5076  BID: 56054	This strike demonstrates an exploit in Java where an attacker can run arbitrary Java code without sandbox protection by leveraging an exploit in the glassfish package.
Strike phpmyadmin 3.5.2.2 Backdoor Access and Code Execution	CWE: 94  CVE: 2012-5159  BID: 55672	This Strike exploits a vulnerability in phpmyadmin that allows for code to be executed through a backdoor.
Strike HP Intelligent Management Center Arbitrary File Upload	CVE: 2012-5201  BID: 58385	This strike exploits a flaw in HP's Intelligent Management Center where a user can upload a zip file which in turn clobbers arbitrary files.
Strike HP Intelligent Management Center File Disclosure	CVE: 2012-5202  BID: 58385	This strike exploits a vulnerability in HP's Intelligent Management Center where an unauthenticated user may download an arbitrary file.
Strike HP Intelligent Management Center File Disclosure Traversal	CVE: 2012-5203  BID: 58385	This strike exploits a vulnerability in HP's Intelligent Management Center where a user can download an arbitrary file.
Strike HP Intelligent Management Center ict File Disclosure Traversal	CVE: 2012-5204  BID: 58385	This strike exploits a vulnerability in HP's Intelligent Management Center where an unauthenticated user may download an arbitrary file.
Strike HP Intelligent Management Center syslog File Disclosure	CVE: 2012-5206  BID: 58385	This strike exploits a vulnerability in HP's Intelligent Management Center where an unauthenticated user may download an arbitrary file.
Strike HP Intelligent Management Center download File Disclosure	CVE: 2012-5208  BID: 58385	This strike exploits a vulnerability in HP's Intelligent Management Center where an unauthenticated user may download an arbitrary file.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP Intelligent Management Center imc File Disclosure	CVE: 2012-5211 BID: 58385	This strike exploits a vulnerability in HP's Intelligent Management Center where an unauthenticated user may download an arbitrary file.
Strike Adobe Flash Player Memory Corruption	CWE: 119 CVE: 2012-5271	This strike exploits a flaw in Adobe's Flash Player where a malformed action script can write variables which are not allocated and leads to memory corruption.
Strike TVMOBili HTTP Request Denial of Service	BID: 56853 CWE: 119 CVE: 2012-5451	This strike exploits a denial of service in TVMOBili when sending an specifically crafted HTTP request to the service listneing on port 30888.
Strike lighttpd Connection Type Denial of Service	CWE: 399 CVE: 2012-5533 BID: 56619	This strike exploits a denial of service bug in lighttpd where a remote user can pass in a malformed connection type which forces the server into an infinite loop.
Strike Squid Proxy Cache Resource Exhaustion	CWE: 20 CVE: 2012-5643	This strike exploits a resource exhaustion vulnerability in Squid Proxy Cache Manager. Memory is allocated on the server to store parameters based only on the Content-Length header, when handling http requests. If an overly large Content-Length value is used then large amounts of data in the body can be used to fill an allocated buffer causing RAM to fill up and possibly a denial of service condition to occur.
Strike VMware vSphere API SOAP Request Denial Of Service	BID: 56571 CWE: 20 CVE: 2012-5703	This strike exploits a mishandling of a tag in the vSphere API which causes the hostd service to terminate for ESX/ESXi servers, causing a denial of service.
Strike McAfee Virtual Technician ActiveX Save File Creation-File Overwrite	CWE: 264 CVE: 2012-5879 BID: 58750	This strike exploits a vulnerable ActiveX control in McAfee Virtual Technician. The Save method allows for creation or overwriting of arbitrary files, including important system files. Successful exploitation could result in creation or overwriting of arbitrary files with privileges of the currently logged in user. Overwriting of system files could result in a denial of service condition.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Quest InTrust Annotation Objects ActiveX Control Index out of Bounds	CVE: 2012-5896 BID: 52765	This strike exploits a memory access vulnerability in Quest InTrust. The vulnerability is due to a flawed ActiveX control, which allows a user to specify a function pointer. A remote, unauthenticated attacker could exploit this vulnerability by enticing a user to view a specially crafted web page.
Strike IBM SPSS SamplePower ActiveX Buffer Overflow	CWE: 119 CVE: 2012-5946 BID: 59559	This strike exploits an IBM SPSS SamplePower ActiveX control buffer overflow vulnerability. Remote attackers can use this vulnerability to let target user to execute arbitrary code.
Strike IBM SPSS SamplePower VSFlexGrid ActiveX Buffer Overflow	CWE: 119 CVE: 2012-5947 BID: 59556	This strike exploits a vulnerable ActiveX control in IBM SPSS SamplePower. The ComboList and ColComboList values in the VSFlexGrid ActiveX control will copy a string to a buffer without validation. Successful exploitation can result in arbitrary code execution or abnormal termination of the browser.
Strike Digium Asterisk Server Stack Buffer Overflow	CWE: 119 CVE: 2012-5976	This strike exploits a defect in Digium's Asterisk Server where a malformed user request to a web page can clobber a stack buffer.
Strike Nagios history.cgi host buffer overflow	CWE: 119 CVE: 2012-6096 BID: 56879	This strike exploits a stack buffer overflow vulnerability in Nagios. History.cgi fails to validate the length of the host parameter. A sufficiently long host parameter can be used to overflow a stack buffer. Successful exploitation could result in execution of arbitrary code with privileges of the Nagios program or abnormal program termination, resulting in a denial of service condition.
Strike Microsoft Internet Explorer removeChild Use After Free	CWE: 399 CVE: 2013-0021	This strike exploits a vulnerability in Microsoft's Internet Explorer where Javascript can modify a document and attempt to reuse data after it has been freed.
Strike Microsoft Internet Explorer SLayoutRun Use After Free Vulnerability	CWE: 399 CVE: 2013-0025 BID: 57830	This strike exploits a remote code execution vulnerability in Microsoft Internet Explorer (IE). The vulnerability occurs when Internet Explorer attempts to access a previously freed object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer CPasteCommand Use After Free Vulnerability	CWE: 399 CVE: 2013-0027 BID: 57831	This strike exploits a remote code execution vulnerability in Microsoft Internet Explorer (IE). The vulnerability occurs when Internet Explorer attempts to access a previously freed object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft Internet Explorer On Before Edit Event Use After Free	CWE: 399 CVE: 2013-0029	This strike exploits a vulnerability in Microsoft's Internet Explorer where Javascript can modify a document and attempt to reuse data after it has been freed.
Strike Microsoft Internet Explorer VML Memory Corruption	CWE: 119 CVE: 2013-0030	A code execution vulnerability has been reported in Microsoft Internet Explorer. The vulnerability is due to memory corruption when parsing Vector Markup Language. A remote attacker could exploit this vulnerability by enticing the target user to open a malicious web page. On successful exploitation, arbitrary code would be executed in the security context of the currently logged-in user.
Strike Microsoft SharePoint CallbackFn Cross Site Scripting	CWE: 264 CVE: 2013-0080 BID: 58371	Microsoft SharePoint contains a cross site scripting vulnerability. The functions CallbackFn and CallbackParams do not sanitize for JavaScript. If a user clicks a link with JavaScript contained in these parameters, the JavaScript will execute with browser privileges. Successful exploitation can result in information disclosure or execution of JavaScript commands.
Strike Microsoft Internet Explorer onResize Use After Free Vulnerability	CWE: 399 CVE: 2013-0087 BID: 58341	This strike exploits a remote code execution vulnerability in Microsoft Internet Explorer (IE). The vulnerability occurs when Internet Explorer attempts to access a previously freed object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft Internet Explorer saveHistory Use After Free Vulnerability	CWE: 399 CVE: 2013-0088 BID: 58342	This strike exploits a remote code execution vulnerability in Microsoft Internet Explorer (IE). The vulnerability occurs when Internet Explorer attempts to access a previously freed object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft Internet Explorer CMarkupBehaviorContext Use After Free Vulnerability	CWE: 399 CVE: 2013-0089 BID: 58343	This strike exploits a remote code execution vulnerability in Microsoft Internet Explorer (IE). The vulnerability occurs when Internet Explorer attempts to access a previously freed object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Honeywell Multiple Products HSCRemoteDeploy RemoteInstaller ActiveX Code Execution	CWE: 94 CVE: 2013-0108 BID: 58134	This strike exploits a code execution vulnerability in multiple Honeywell products. The HSCRemoteDeploy.RemoteInstaller ActiveX control found in the Honeywell HMIWeb Browser can be used to access and execute an arbitrary HTML application. Successful exploitation could allow for execution of arbitrary code with user privileges.
Strike Ruby on Rails Action Pack Type Casting Parameter Parsing Vulnerability	CWE: 20 CVE: 2013-0156 BID: 57187	This strike exploits a remote code execution vulnerability in Ruby on Rails. The vulnerability is due to a type casting in the Ruby on Rails XML processor. Exploiting this vulnerability could allow remote attackers to execute arbitrary code on the target server.
Strike Movable Type 4.2x, 4.3x Upgrade Script RCE	CWE: 287 CVE: 2013-0209 CVE: 2012-6315	This strike exploits Movable Type 4.2x, 4.3x upgrade script to gain remote code execution on target server.
Strike MiniUPnPd SOAP Remote Code Execution	CWE: 119 CVE: 2013-0230 BID: 57608	This strike identifies a vulnerability in MiniUPnP server. A SOAP action sent to the server with a crafted HTTP header can overflow a stack buffer allowing for remote code to be executed.
Strike Ruby on Rails JSON Processor YAML Deserialization Vulnerability	CVE: 2013-0333 BID: 57575	This strike exploits a remote code execution vulnerability in Ruby on Rails. The vulnerability is due to an input validation error when deserializing YAML using JSON processor. Exploiting this vulnerability could allow remote, unauthenticated attackers to execute arbitrary code on the target server.
Strike Oracle Application Framework Diagnostic and Developer Mode Information Disclosure	CVE: 2013-0397	This Strike identifies a vulnerability in Oracle Application Framework, in which a user can access diagnostic and developer modes without having to be authenticated. By setting either of these parameters a user can perform a number of tracing and logging functions that provide the user with sensitive information like settings, session information and passwords.
Strike Adobe ColdFusion scheduleedit.cfm Authentication Bypass	CWE: 255 CVE: 2013-0625 BID: 57164	This strike exploits an authentication bypass vulnerability in Adobe ColdFusion. The flaw is due to a lack of authentication validation by the ColdFusion administration web console when creating a scheduled task. A remote unauthenticated attacker could exploit this vulnerability by enticing an authenticated user to view a malicious web page. Exploitation of this vulnerability could allow an attacker to upload malicious code to be executed at a scheduled time.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe ColdFusion rdsPasswordAllowed Authentication Bypass Vulnerability	CWE: 276 CVE: 2013-0632	This strike exploits a authentication bypass vulnerability in the web component of Adobe ColdFusion. The vulnerability is due to incorrect default permissions. A remote unauthenticated attacker could exploit this vulnerability by send a specially crafted request. Successful exploitation could allow an attacker to bypass authentication mechanisms and gain unauthorized admin access to the application.
Strike Siemens SIMATIC RegReader ActiveX Buffer Overflow	CWE: 119 CVE: 2013-0674	This strike exploits a vulnerability in Siemen's SIMATIC RegReader where a malformed parameter inside an ActiveX control can clobber a buffer.
Strike Novell GroupWise ActiveX Pointer Dereference	CWE: 78 CVE: 2013-0804	This strike exploits a vulnerability in Novell's GroupWise Client where a malformed ActiveX control can dereference an arbitrary pointer which can lead to a crash.
Strike Oracle Java 2D ImagingLib Integer Overflow	CVE: 2013-0809 BID: 58296	This strike exploits a remote code execution vulnerability in Oracle Java. The vulnerability is due to an integer overflow in the ImagingLib class, in the use of BufferedImage method. Successful exploitation of these vulnerabilities could result in the execution of arbitrary Java code on the target system.
Strike Novell ZENworks Configuration Management umaninv Information Disclosure	CWE: 22 CVE: 2013-1084	This strike exploits a information disclosure vulnerability that can be triggered by sending malicious HTTP requests. The request can be crafted to traverse directories and as such access any file on disk.
Strike Novell Messenger Client Stack Buffer Overflow	CWE: 119 CVE: 2013-1085	This strike exploits a vulnerability in Novell's Messenger Client where a malformed href response refers to a file that doesn't exist and the resulting error message can clobber a stack buffer.
Strike Microsoft HTTP Denial of Service	CWE: 399 CVE: 2013-1305	This strike exploits a denial of service in Microsoft's handling of malformed HTTP requestes.
Strike Internet Explorer .ipsum Construct Layout Memory Corruption	CWE: 416 CVE: 2013-1310 BID: 59751	This strike exploits a Memory Corruption vulnerability in Inernet Explorer. The vulnerability is due to error while handling CSS psuedo-objects. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SonicWall Multiple Products setSessionCheck Authentication Bypass	CVE: 2013-1359 BID: 57445	This strike exploits a vulnerability that is present in multiple SonicWall products and that allows remote unauthenticated access. The vulnerability is located at the level of the applianceMainPage
Strike DataLife Engine 9.7 Remote Code Execution	CWE: 94 CVE: 2013-1412 BID: 57603	Due to improper sanitization of user-supplied input into a preg_replace function in DataLife Engine 9.7, it is possible to gain remote code execution on the target system
Strike Piwigo Photo Gallery Project LocalFiles Editor Plugin Cross Site Request Forgery	CWE: 352 CVE: 2013-1468	This strike exploits a vulnerability in the LocalFiles Editor in Piwigo versions 2.4.6 and prior. A cross site request forgery attack exists that allows for the attacker to trick an administrator into visiting a malicious page which can create and execute PHP files.
Strike Piwigo Photo Gallery Project install script Directory Traversal	CWE: 22 CVE: 2013-1469 BID: 58229	This strike exploits a vulnerability in the Piwigo install.php script. Specifically a user is able to navigate outside of the restricted path and gain access to and delete arbitrary files.
Strike Oracle Document Capture BlackIceDevMode SetAnnotationFont ActiveX Buffer Overflow	CVE: 2013-1516 BID: 59112	This strike exploits a vulnerable ActiveX control in Oracle Document Capture. An overly long IfFaceName parameter in the SetAnnotationFont function of the BlackIceDevMode ActiveX control will overflow a stack buffer. Successful exploitation may result in arbitrary code execution or abnormal termination of the client web browser.
Strike Dlink IP Camera Authenticated Arbitrary Command Execution	CVE: 2013-1599	This strike exploits a command execution vulnerability inside Dlink's IP Cameras through a improperly parsed parameter supplied to a cgi script.
Strike Mozilla Firefox crypto.generateCRMFRequest Peek into Privileged Callers Scope	CWE: 20 CVE: 2013-1710 BID: 61900	This strike exploits a vulnerability in Mozilla Firefox. It is possible to craft Javascript in such a way that allows remote attackers to execute arbitrary JavaScript code or conduct cross-site scripting attack when calling the crypto.generateCRMFRequest function. This can lead to remote code execution on the victim's machine.
Strike Apache Rave v.11-.20 User Information Disclosure	CWE: 200 CVE: 2013-1814	This Strike exploits a information disclosure vulnerability in Apache Rave .11-.20. An authenticated user can retrieve the complete users object information by querying the correct path.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Squid Proxy Server Accept Language Denial of Service	BID: 58316 CWE: 20 CVE: 2013-1839	This strike exploits a flaw in the Squid Proxy Server where a malformed language name will put the server into an infinite loop.
Strike Apache HTTP Server RewriteLog Command Execution	CWE: 310 CVE: 2013-1862 BID: 59826	This strike identifies a vulnerability in the Apache HTTP Server mod_Rewrite module. This module has a logging feature that can be triggered that will record URL requests to a log file. Due to improper sanitation of these requests an attacker can send a URI that encodes a command to be executed when the mod_rewrite module logs the request. If the target views and then presses enter the command will be executed with the privileges of the current logged in user.
Strike Apache HTTP Server Merge Denial of Service	BID: 61129 CWE: 264 CVE: 2013-1896	This strike exploits a denial of service vulnerability in Apache HTTP server. The vulnerability is due to lack of input sanitation in the http request.
Strike Wordpress W3 Total Cache PHP Code execution	BID: 59316 CVE: 2013-2010	This strike exploits a vulnerability in the two popular Wordpress plugins, w3-total-cache and wp-super-cache. Both plugins can handle dynamic content on the page. Multiple tags specific to the plugins are interpreted as HTML comments by wordpress and but, they are interpreted and executed on the server. A malicious attacker can exploit this by inserting scripts inside HTML comments and thus successfully leverage server side code execution. All versions of W3 Supercache prior to 1.2 as well as W3 Total Cache prior to 0.9.2 are vulnerable.
Strike PHP php_quot_print_encode parameter parsing heap buffer overflow	CWE: 119 CVE: 2013-2110 BID: 60411	This strike exploits a buffer overflow vulnerability in PHP. When parsing percent encoded parameters, specially crafted strings can cause a heap buffer overflow. Successful exploitation may allow arbitrary code execution or abnormal termination of application using php, resulting in a denial of service condition.
Strike Apache Struts URL Command Execution	CWE: 94 CVE: 2013-2115 BID: 60167	This strike exploits command execution vulnerability in Apache Struts. A specially crafted URL can be sent to enable allowStaticMethodAccess and execute arbitrary Java runtime commands. Successful exploitation can result in execution of arbitrary code.

Name	References	Description
Strike Apache Struts2 wildcard OGNL command execution	BID: 60346 BID: 64758 CWE: 94 CVE: 2013-2134	This strike exploits a command execution vulnerability in Apache struts2. This vulnerability is due to no input check the ognl action name in http request. Remote attackers may do arbitrary code execution on the target system.
Strike Apache Struts OGNL action- redirect- redirectAction Command Execution	CWE: 20 CVE: 2013-2251 BID: 61189	This strike exploits command execution vulnerability in Apache Struts. A specially crafted HTTP GET or POST requests can be sent to the Apache Struts server to execute arbitrary code with user privileges.
Strike HP System Management Homepage iprange Stack Buffer Overflow	CWE: 121 CVE: 2013-2362	A stack buffer overflow exists in HP System Management Homepage. The vulnerability is due to insufficient input validation when handling HTTP requests containing an iprange variable to the /proxy/DataValidation URI. A remote unauthenticated attacker could exploit this vulnerability by sending a crafted request to the vulnerable service. Successful exploitation could result in arbitrary code execution in the context of the currently affected service, which is System by default.
Strike HP SiteScope SOAP call code execution	CVE: 2013-2367	This strike exploits a code execution vulnerability in HP SiteScope SOAP. This vulnerability is due to lack of checking the ahs key value which may be followed by malicious command. Attack can use this vulnerability to do command injection attack on the target system.
Strike HP LoadRunner micWebAjax.dll ActiveX Control Vulnerability	CVE: 2013-2368 BID: 61436	This strike exploits a vulnerability within HP LoadRunner. The vulnerability is due to insufficient boundary checking of micWebAjax parameters. By enticing a user to view a malicious web page an attacker could execute arbitrary code in the security context of the user.
Strike HP LoadRunner lrFileIOService WriteFileBinary ActiveX Control Pointer Input Validation Error	CVE: 2013-2370 BID: 61441	This strike exploits a vulnerable ActiveX control in HP LoadRunner. The WriteFileBinary method in the lrFileIOService ActiveX Component takes a parameter used as a pointer, which can be used to point to invalid memory, causing abnormal termination, or a valid address to alter program flow.
Strike Oracle Java Final Field Overwrite Remote Code Execution	CWE: 265 CVE: 2013-2423	This strike exploits a design weakness vulnerability in Oracle Java JRE/JDK. This vulnerability is due to improper validation of user supplied input. A remote attacker could exploit this vulnerability by enticing a user to open a crafted webpage and can result in remote code execution in the context of the user running the browser.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Java java.util.concurrent.ConcurrentHashMap Memory Corruption	CVE: 2013-2426 BID: 59206	This strike exploits a memory corruption vulnerability in Oracle Java. The vulnerability is due to insufficient validation of serialized ConcurrentHashMap objects. Successful exploitation of this vulnerability could result in the execution of arbitrary Java code on the target system.
Strike Oracle Java sun.awt.image.ImagingLib.lookupByteBI Buffer Overflow	CVE: 2013-2463 BID: 60655	This strike exploits a buffer overflow vulnerability on the Oracle Java applet image rendering library. The vulnerability can be triggered due to improper input validation when calling the lookupByteBi function contained in the ImagingLib library. A user could be manipulated into accessing a web page that downloads and executes a malicious applet that can lead to arbitrary code execution with local user privileges.
Strike Oracle Java ImagingLib lookupByteBI Buffer Overflow	CVE: 2013-2470 BID: 60651	This strike exploits a buffer overflow vulnerability on the Oracle Java applet image rendering library. The vulnerability can be triggered due to inadequate memory management when calling the lookupByteBi function contained in the ImagingLib library. A user could be manipulated into accessing a web page that downloads and executes a malicious applet that can lead to arbitrary code execution with local user privileges.
Strike Oracle Java sun.awt.image.ByteComponentRaster Memory Corruption	CVE: 2013-2473 BID: 60623	This strike exploits a buffer overflow vulnerability on the Oracle Java applet image rendering library. The vulnerability can be triggered due to inadequate memory management when manipulating a ByteComponentRaster object with specific methods inside the AlphaComposite class. A user could be manipulated into accessing a web page that downloads and executes a malicious applet that can lead to arbitrary code execution with local user privileges.
Strike Digium Asterisk HTTP Post Request Content Length Resource Exhaustion	CWE: 119  CVE: 2013-2686  BID: 58756	This strike exploits a resource exhaustion vulnerability in Digium Asterisk. When receiving an HTTP POST request to certain URLs, Asterisk HTTP management interface allocates a heap buffer of Content-Length + 1. An attacker could send specially crafted messages with large Content-Length values to exhaust heap memory. Successful exploitation could lead to a denial of service condition.
Strike WellinTech Multiple Products ActiveX ProjectURL Property Insecure Library Loading	CWE: 94  CVE: 2013-2827  BID: 64941	This strike exploits a dll hijacking vulnerability in multiple WellinTech products. The vulnerability is due to a lack of validation of files downloaded from a source specified by the ProjectURL property of the ClientDownload ActiveX control. By enticing a user to open a crafted web page an attacker could download and execute a file from a remote location.
Strike Microsoft Internet Explorer CMarkup ElementRelease Use After Free	CWE: 119  CVE: 2013-3114  BID: 60384	This strike exploits a use after free vulnerability in Microsoft Internet Explorer. In order to exploit this vulnerability, first a DOM object must be assigned an attribute using createAttribute or setAttributeNode. The object assigned the attribute is then destroyed. If any references to the attribute still exist, any remaining references to the attribute could be accessed to create a use-after-free condition. Successful exploitation can result in execution of arbitrary code with user privileges or abnormal termination of Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft IE CFlatMarkupPointer Object Handling Use-after-free	CWE: 119 CVE: 2013-3184 BID: 61668	This strike exploits a memory corruption vulnerability in Microsoft Windows Internet Explorer. The vulnerability lies in the modification of content-editable objects during onmove events. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim machine in the context of the user.
Strike phpMyAdmin preg_replace_php_code_execution	CVE: 2013-3238 BID: 59460	This strike exploits a code execution vulnerability in phpMyAdmin. A specially crafted HTTP POST message can be used to send arbitrary php code to the server. Successful exploitation can result in execution of the arbitrary php code with privileges of the HTTP server.
Strike Adobe ColdFusion filename Directory Traversal	CVE: 2013-3336 BID: 59773	Adobe ColdFusion contains a directory traversal vulnerability. The flaw is due to a lack of input validation by download.cfm. A remote unauthenticated attacker could exploit this vulnerability to retrieve arbitrary files, including the password file for the ColdFusion administration console.
Strike Airlive IP Camera Cross Site Request Forgery	CWE: 352 CVE: 2013-3540	This strike identifies a vulnerability in Airlive IP Cameras Web Interface. Specifically a malicious user can alter the parameters of the web interface by sending modified GET requests to the target allowing for a variety of commands to be executed that are normally not allowed. By taking advantage of the vulnerability in the usrgrp.cgi parameter in this strike we are able to create users with administrator privelages.
Strike Linksys WRT110 Command Injection vulnerability	BID: 61151 CVE: 2013-3568	This strike exploits a vulnerability inside the Linksys WRT100 and WRT110 home routers. It is possible for an authenticated remote attacker to execute arbitrary commands on a system by manipulating the arguments to the ping.cgi script.
Strike Samsung DVR Authentication Bypass	CWE: 255 CVE: 2013-3585	This strike identifies a vulnerability in Samsung DVR Firmware v1.10. An authentication bypass is possible because of improper validation of CGI page requests. If an HTTP request is made to one of many URI paths with a malicious cookie value set, then access will be given to the attacker with the ability to perform many functions such as read usernames and passwords, create users, and read and modify device configuration settings.
Strike SuperMicro IPMI login.cgi Buffer Overflow	CWE: 119 CVE: 2013-3607	This strike exploits a buffer overflow vulnerability in SuperMicro IPMI versions prior to SMT_X9_315. The vulnerability is caused by the unsafe usage of strcpy when copying to local buffers in login.cgi. A remote, unauthenticated attacker could exploit this by sending a crafted request, possibly obtaining code execution on the machine.

Name	References	Description
Strike SuperMicro IPMI close_window.cgi Buffer Overflow	CWE: 119 CVE: 2013-3623 BID: 63775	This strike exploits a buffer overflow vulnerability in SuperMicro IPMI versions prior to SMT_X9_315. The vulnerability is caused by the unsafe usage of strcpy when copying to local buffers in close_window.cgi. A remote, unauthenticated attacker could exploit this by sending a crafted request, possibly obtaining code execution on the machine.
Strike Airlive IP Camera List Parameter Information Disclosure	CWE: 264 CVE: 2013-3686	This strike identifies a vulnerability in Airlive IP Cameras. Specifically an attacker can send a malicious request to the target by means of operator/param, which will then disclose restricted information like the administrator password.
Strike Monkey HTTPD Server 1.1.1 Denial of Service	CWE: 20 CVE: 2013-3724	This Strike exploits a denial of service vulnerability in Monkey HTTPD Server version 1.1.1. When sending a request to the vulnerable service listening on port 2001 with a null byte embedded within the URI a segmentation fault occurs.
Strike Oracle Endeca Server createDataStore SOAP Request Command Execution	CVE: 2013-3763 BID: 61217	This strike exploits a command execution vulnerability in Oracle Endeca Server. A specially crafted SOAP request with the createDataStore tag can be used to execute arbitrary commands on the target system with system privileges.
Strike Oracle BPEL Process Manager BPELConsole Directory Traversal	CVE: 2013-3828 BID: 63058	This strike exploits a directory traversal vulnerability in Oracle BPEL Process Manager. GET requests to BPELConsole are not sanitized for directory traversal characters. A specially crafted GET request can be sent to access arbitrary javascript files. Successful exploitation could result in information disclosure.
Strike Microsoft .NET Framework XML XXE DOS	CWE: 20 CVE: 2013-3860 BID: 62820	This strike exploits a denial of service vulnerability in Microsoft .NET Framework. This vulnerability is due to improper handling XML files. A remote attacker can take advantage of this vulnerability to gain arbitrary files on the target system.
Strike Microsoft InformationCardSigninHelper ActiveX Remote Code Execution	CWE: 119 CVE: 2013-3918	This strike exploits a memory corruption associated with the icardie.dll dynamic library in Microsoft Windows. If a user opens a specially crafted web page where a InformationCardSigninHelper ActiveX control is instantiated, on a vulnerable machine, a memory corruption may be triggered that can lead to arbitrary code execution using local privileges. All versions of Microsoft Windows and Microsoft Windows Server are affected by this vulnerability.
Strike Squid HTTP Host Header Denial of Service	CWE: 20 CVE: 2013-4123	This strike exploits a vulnerability in Squid Internet Proxy application. If an HTTP request is received, squid parses the host headers looking for a hostname:portnumber. The port number is then used in a conversion, and if this conversion fails the process will terminate.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SpringSource Spring Framework XEE disclosure	CWE: 264 CVE: 2013-4152 BID: 61951	This strike exploits an information disclosure vulnerability in SpringSource Spring Framework XEE disclosure. This vulnerability is due to improper handling XML files. A remote attacker can take advantage of this vulnerability to gain arbitrary files on the target system.
Strike Apache Roller OGNL Injection Remote Code Execution	CWE: 94 CVE: 2013-4212 BID: 63928	This strike exploits a security vulnerability which allows for code execution inside apache roller. The exploit provides remote unauthenticated users with command execution on the target system
Strike Nginx Request URI Verification Security Bypass	CWE: 264 CVE: 2013-4547	This strike exploits a security verification bypass flaw inside NGINX engine which takes place when incorrectly validating input from a request following a space character. The vulnerability can lead to information disclosure
Strike Netgear ProSafe startup-config Information Disclosure	CWE: 200 CVE: 2013-4775 BID: 63646	This strike exploits an information disclosure vulnerability in Netgear ProSafe. An HTTP GET request to /filesystem/startup-config will return various startup configuration details, including administrator credentials.
Strike Netgear ProSafe GET filesystem denial of service	CVE: 2013-4776 BID: 61924	This strike exploits a denial of service vulnerability in Netgear ProSafe devices. An HTTP GET request to / filesystem/ with no content will cause the device to restart or crash. Repeated requests can result in a denial of service condition.
Strike HP LoadRunner directory disclosure	CVE: 2013-4798 BID: 61443	This strike exploits a HP LoadRunner ActiveX control directory traversal vulnerability which is due to bad input sanitization of file name. Remote attackers may do arbitrary code execution on the target system.
Strike HP Intelligent Management Center BIMS UploadServlet Lack of Authentication and Directory Traversal	CVE: 2013-4822 BID: 62895	This strike exploits a lack of authentication and directory traversal vulnerability in HP Intelligent Management Center. PUT requests sent to UploadServlet are not authenticated. Furthermore, UploadServlet does not sanitize directory traversal characters. Successful exploitation can result in upload of arbitrary files in arbitrary locations, including upload of executable files or overwrite of system files.
Strike HP Intelligent Management Center BIMS bimsDownload Information Disclosure	CVE: 2013-4823	This strike exploits a command injection vulnerability inside Oracle's Secure Backup Administration web interface. The vulnerability allows command injection by passing malicious URL encoded parameters ("other") to php scripts.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP euAccountService Servlet Authentication Bypass Vulnerability	CWE: 287 CVE: 2013-4824 BID: 62902	This strike exploits an authentication bypass vulnerability in HP Intelligent Management Center. The vulnerability is failure to properly authenticate HTTP requests by the euAccountService servlet. A remote, unauthenticated user can exploit the vulnerability to create arbitrary web administration accounts, allowing access to all managed devices and users.
Strike HP Intelligent Management Center SOM sdFileDownload Information Disclosure	CWE: 200 CVE: 2013-4826 BID: 62898	This strike exploits a information disclosure vulnerability inside HP Intelligent Management Center SOM that can be triggered by sending malicious HTTP requests. The request can be crafted to traverse directories and as such access any file on disk.
Strike HP SiteScope issueSiebelCmd SOAP Request Handling Vulnerability	CVE: 2013-4835 BID: 63478	This strike exploits a command execution vulnerability in HP SiteScope. The vulnerability is due to authentication failure when handling issueSiebelCmd SOAP requests. Remote, unauthenticated users could execute arbitrary code simply by sending a malicious SOAP request.
Strike HP LoadRunner Virtual User Generation Emulation Directory Traversal	CVE: 2013-4837	This strike exploits two vulnerabilities inside HP LoadRunner that allow directory traversal which in turn can lead to unauthenticated arbitrary code execution or unauthenticated information disclosure
Strike HP LoadRunner Virtual User Generator saveCodeRuleFile Directory Traversal	CVE: 2013-4838 BID: 63476	This strike exploits a vulnerability in HP LoadRunner software suite . A flaw in authorization on the Virtual User Generator component could allow a remote unauthenticated attacker to delete or modify the contents of any file on the machine running the vulnerable software with elevated privileges.
Strike Sophos Web Appliance command execution	CWE: 78 CVE: 2013-4983 BID: 62263	This strike exploits a vulnerability in the Sophos Web Appliance. Due to improper input validation an unauthenticated user may execute commands on the operating system using the web interface. All versions of the Sophos Web Appliance before 3.7.9.1 and 3.8 before 3.8.1.1 are vulnerable to this attack.
Strike Symantec Endpoint Protection XXE Injection	CVE: 2013-5014 BID: 65466	This strike exploits an XXE injection vulnerability in Symantec Endpoint Protection management console. This vulnerability is due to improper handling XML external entities in the management console. A remote attacker can take advantage of this vulnerability to do DoS attack on the target system.
Strike National Instruments ABB CWGraph3D ActiveX Arbitrary File Creation	CWE: 22 CVE: 2013-5022 BID: 61282	This strike exploits an arbitrary file creation vulnerability in 3D Graph ActiveX control. The flaw is due to a lack of input validation by the 'ExportStyle' method. An attacker could exploit this vulnerability by enticing a target user to view a specially crafted web page.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Scripting Dictionary Runtime Object Library Use After Free	CWE: 416 CVE: 2013-5056	This strike exploits a use after free error triggered because of an error Microsoft Scripting Runtime Object Library . If a user opens a specially crafted web page, on a vulnerable machine, a use after free memory corruption is triggered that can lead to arbitrary code execution using local privileges. All versions of Microsoft Windows are vulnerable to this attack.
Strike Graphite Web Remote Code Execution	CWE: 94 CVE: 2013-5093 BID: 61894	This strike exploits a remote code execution vulnerability in the renderLocalView function of Graphite web versions .9.5 through .9.10. The vulnerability lies in the way that it uses the Python Pickle module.
Strike TP-Link TL-WR740N Wireless Router DoS	CWE: 134 CVE: 2013-5135	This strike exploits a vulnerability inside TP-Link TL-WR740N wireless routers that can cause a denial of service attack. The vector for attack is represented by an improper parsing process for http requests. The attack can be triggered without authentication
Strike IBM Platfor Symphony SOAP Request Processing Buffer Overflow	CWE: 119 CVE: 2013-5387 BID: 63517	This strike exploits a vulnerability in IBM Symphony cluster computing platform and SDK. Due to improper bounds validation, a remote unauthenticated attacker can send a specially crafted SOAP request causing a buffer overflow condition that can lead to DOS conditions. All versions of IBM Symphony prior to 5.2 and 6.1.x are vulnerable.
Strike IBM Rational Focal Point Login Information Disclosure	CVE: 2013-5397 BID: 64338	This strike identifies a vulnerability in IBM Rational's Focal Point. Specifically the vulnerability occurs when a request is made to the Login servlet. Requests sent to this URI are not properly validated, and xml configuration files can be disclosed to a remote unauthenticated user.
Strike IBM Rational Focal Point Information Disclosure	CVE: 2013-5398 BID: 64339	This strike identifies a vulnerability in IBM Rational's Focal Point. Specifically the vulnerability occurs when a request is made to the RequestAccessController servlet. Requests sent to this URI are not properly validated, and xml configuration files can be disclosed to a remote unauthenticated user.
Strike Cisco Prime Data Center Network Manager processImageSave.jsp Arb File Upload	CWE: 78 CVE: 2013-5486 BID: 62484	This strike exploits a vulnerability inside Cisco's Prime Data Center Network Manager, which allows remote unauthenticated arbitrary file upload through an improperly validated parameter passed through a webpage.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco Prime Data Center Network Manager Download Servlet Information Disclosure	CWE: 200 CVE: 2013-5487 BID: 62483	This strike exploits a vulnerability inside Cisco's Prime Data Center Network Manager versions prior to 6.2, which allows remote unauthenticated arbitrary file information disclosure through the downloadServlet request URI.
Strike D-Link DSL-2740B Cross Site Request Forgery	CWE: 352 CVE: 2013-5730 BID: 62356	This strike exploits a cross site request forgery exploit in D-Link DSL-2740B devices. An attacker can send a malicious web page which will then use the target's credentials to change router settings, including things such as disabling the firewall or the MAC address filter.
Strike Zabbix 2.0.8 SQL Injection	CWE: 89 CVE: 2013-5743 BID: 62794	This strike exploits an SQL injection vulnerability in Zabbix versions 1.8.17, 2.0.8, 2.1.6. The vulnerability is caused by improper sanitization of user-controlled data being used inside an SQL query. In order to exploit the vulnerability, a remote attacker would send crafted requests to the httpmon.php page. Successful exploitation could lead to privilege escalation. Having admin privileges, the attacker may then use regular application functions, obtaining code execution in the context of the web service.
Strike Oracle Demantra 12.2.1 Arbitrary File Disclosure	CVE: 2013-5877 BID: 64831	This strike exploits a vulnerability inside Oracle Demantra 12.2.1 which allows an attacker to read the content of arbitrary files on the server.
Strike WordPress Complete Gallery Manager Plugin Arbitrary File Upload	CVE: 2013-5962	This strike exploits a vulnerability inside the Complete Gallery Manager Plugin for WordPress which allows remote users to upload arbitrary files to the server.
Strike D-Link router web interface backdoor	CWE: 264 CVE: 2013-6026 BID: 62990	This strike exploits a vulnerability in web interface for D-Link routers. By using a specially crafted User-Agent string a remote attacker could completely bypass authentication and execute commands on the remote device with full administrative rights. The following models are vulnerable: DIR-100, DIR-120, DI-624S, DI-524UP, DI-604S, DI-604UP, DI-604+, TM-G5240.
Strike MW6 Aztec ActiveX Control Buffer Overflow	CVE: 2013-6040	This strike exploits buffer overflow vulnerability within the MW6 Technologies ActiveX Control. This vulnerability is due to lack of boundary checking in the MW6 Technologies Aztec ActiveX Control. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike KingView ActiveX Control File Execution	CWE: 264 CVE: 2013-6128 BID: 62419	This strike exploits a KingView ActiveX control code execution vulnerability which is due to no confirmation when executing the command in the ActiveX control. Remote attackers may do arbitrary file creation on the target system.
Strike HP Service Virtualization AutoPass License Server Directory Traversal	CWE: 22 CVE: 2013-6221 BID: 67989	This strike exploits a vulnerability inside HP Service Virtualization Autopass. Which allows directory traversal due to improper validation of user supplied data. Exploitation of this vulnerability can result in bypassing of security restrictions and arbitrary code execution.
Strike Apache Solr SolrResourceLoader Directory Traversal	CWE: 22 CVE: 2013-6397 BID: 63935	This strike exploits a security vulnerability that allows directory traversal and xslt code execution inside apache Solr. The vulnerability is triggered through a improperly sanitized GET request parameter
Strike PHP OpenSSL Certificate Corruption	BID: 64225 CWE: 119 CVE: 2013-6420	This strike exploits a vulnerability in the OpenSSL extension of PHP where a malformed certificate file can lead to memory corruption.
Strike SpringSource Spring Framework XML XEE disclosure	BID: 64947 CWE: 352 CVE: 2013-6429	This strike exploits an information disclosure vulnerability in SpringSource Spring Framework XEE. This vulnerability is due to improper handling XML files. A remote attacker can take advantage of this vulnerability to gain arbitrary files on the target system.
Strike Red Hat JBoss Seam XML XEE disclosure	CWE: 200 CVE: 2013-6447 BID: 65051	This strike exploits an information disclosure vulnerability in Red Hat JBoss Seam XML XEE. This vulnerability is due to improper handling XML files. A remote attacker can take advantage of this vulnerability to gain arbitrary files on the target system.
Strike IBM Tealeaf CX testconn_host Remote Command execution	CWE: 78 CVE: 2013-6719 BID: 65984	This strike exploits a remote command execution vulnerability in IBM Tealeaf CX. An HTTP POST request with a specially crafted testconn_host parameter can be used to execute arbitrary OS commands.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Splunk Collect Directory Traversal	CWE: 22 CVE: 2013-6771 BID: 62632	This strike exploits a vulnerability inside Splunk which allows for directory traversal through improperly parsed input parameters. If exploited, as part of specific scenarios, the vulnerability could lead to arbitrary code execution.
Strike EMC CMCNE FileUploadController Arbitrary File Upload	CWE: 94 CVE: 2013-6810	This strike exploits a EMC Connectrix Manager Converged Network Edition SAN management suite. Due to improper authorization, a remote unauthenticated attacker may upload an arbitrary files through the FileUploadController servlet. All versions of the software prior to 12.0.3 are vulnerable.
Strike Synology DiskStation manager SLICEUPLOAD Remote Command Execution	CWE: 264 CVE: 2013-6955	This strike exploits a vulnerability for Synology Diskstation Manager. Specifically, the exploit targets how user input is processed and appended to files when using the SLICEUPLOAD functionality. The flaw allows an unauthenticated remote attacker to write random command to server side script files and potentially leverage arbitrary command execution. All version belonging to 4.1.x software branch are vulnerable.
Strike Apache Camel XML Entity Information Disclosure	CWE: 264 CVE: 2014-0002 BID: 65901	This strike exploits an information disclosure vulnerability in Apache Camel. XML entities with PUBLIC or SYSTEM identifiers are processed and returned. An attacker can craft a SYSTEM entity to return information on system information or a PUBLIC entity to send requests from the Camel server, possibly allowing for policy bypass.
Strike Apache Tomcat FileUpload Content-Type Header Infinite Loop	BID: 65400 CWE: 264 CVE: 2014-0050	This strike exploits a vulnerability in Apache Tomcat web server. The vulnerability is located in the Apache Common FileUpload component specifically when parsing the Content-Type header. The flaw allows an unauthenticated remote attacker to send a specially crafted HTTP request that, once received by the server will generate a DOS condition. Apache Tomcat version 7.0.0-7.0.50 are affected by this flaw
Strike SpringSource Spring Framework XML External Entity	CWE: 352 CVE: 2014-0054 BID: 66148	This strike exploits an XML External Entity vulnerability in SpringSource Spring Framework. SpringSource will accept XML External Entities from any source. A crafted XML External Entity can be used to disclose information on the target system, cause Spring Framework to exit abnormally, leading to a denial of service condition, or us the target system to make request, possibly bypassing security policy.
Strike Apache Struts ClassLoader Delegate Security Bypass	CVE: 2014-0094 BID: 65999	This strike exploits a vulnerability inside Apache Struts which can allow remote code execution by sandbox bypass.

Name	References	Description
Strike Apache HTTP Server mod_log_config DoS	CWE: 20 CVE: 2014-0098 BID: 66303	This strike targets a vulnerability inside Apache HTTP Server that causes denial of service. The attack is triggered through cookie values and can be triggered when the mod_log_config module is activated.
Strike Apache Struts CookieInterceptor ClassLoader Security Bypass	CWE: 264 CVE: 2014-0113 BID: 67081	This strike exploits a vulnerability in the Apache Struts web suite. Due to improper sanitization it is possible for a remote attacker to invoke the ClassLoader and effectively achieve arbitrary code execution. All versions before 2.3.16.2 are vulnerable to this attack.
Strike Apache Struts ClassLoader Security Bypass	CWE: 20 CVE: 2014-0114 BID: 67121	This strike exploits a security bypass vulnerability in Apache Struts. An attacker can send crafted HTTP requests to manipulate the Java ClassLoader. Manipulation of the Java Classloader can be further exploited to achieve arbitrary code execution.
Strike Apache mod_proxy Denial of Service	CWE: 20 CVE: 2014-0117 BID: 68740	This strike exploits a denial of service vulnerability inside Apache web server. The vulnerability exists due to improper parsing of crafted Connection HTTP headers when Apache is ran using the mod_proxy module in reverse proxy mode.
Strike Apache HTTP Server mod_status Race Condition Heap Buffer Overflow, verified	CWE: 362 CVE: 2014-0226 BID: 68678	This strike exploits a race condition vulnerability in Apache HTTP Server which leads to a heap buffer overflow. When simultaneously processing requests to server-status and to any other uri, it is possible for a non-null terminated string to be created. The system attempts to copy this until it finds null characters, leading to a heap buffer overflow. Successful exploitation can result in execution of arbitrary code or abnormal termination of the Apache HTTP Server.
Strike Microsoft Direct2D API SVG Path Tag Memory Corruption	BID: 65393 CWE: 119 CVE: 2014-0263	This strike exploits a memory corruption vulnerability in the Microsoft Direct2D API. If Internet Explorer encounters an SVG Path tag that has coordinate values that are too large, memory gets corrupted and a denial of service condition will occur.
Strike Microsoft XML Core Services transformNode Information Disclosure	CWE: 200 CVE: 2014-0266 BID: 65407	This strike exploits an information disclosure vulnerability in Microsoft XML Core Services. A specially crafted web page with a certain activeX control and a specially crafted xml object can be used to return information about arbitrary files on the target system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Scripting Runtime Object Library Use After Free	BID: 65395 CWE: 119 CVE: 2014-0271	This strike exploits a use after free error triggered because of an error Microsoft Scripting Runtime Object Library . If a user opens a specially crafted web page, on a vulnerable machine, a use after free memory corruption is triggered that can lead to arbitrary code execution using local privileges. All versions of Microsoft Windows are vulnerable to this attack.
Strike Microsoft Internet Explorer Use After Free	BID: 65372 CWE: 119 CVE: 2014-0274	This strike exploits a vulnerability in Microsoft Internet Explorer. If a DOMNodeRemoved event is triggered and all the objects that belong to the current HTMLSelection object are removed inside the event handler for DOMNodeRemoved, a use-after-free condition can occur.
Strike Microsoft Internet Explorer CSS dir rtl Memory Corruption	CWE: 119 CVE: 2014-0278 BID: 65377	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. When specially crafted CSS style content is dynamically changed to right-to-left, an uninitialized object is accessed, leading to memory corruption. Successful exploitation may result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft IE CInput Use-after-free Vulnerability	CWE: 119 CVE: 2014-0282 BID: 67862	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability is triggered when an attempt is made to access a previously deleted CInput object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft IE SVG HTML Content Use-after-free Vulnerability	CWE: 119 CVE: 2014-0283 BID: 65382	This strike exploits a remote code execution vulnerability in Microsoft Internet Explorer (IE). The vulnerability occurs when Internet Explorer attempts to access a previously freed SVG clipPath object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft Internet Explorer SelectAll appendChild Use After Free	CWE: 119 CVE: 2014-0287 BID: 65386	This strike exploits a use after free vulnerability in Microsoft Internet Explorer. A specially crafted webpage which uses 1) the document.write function in a DOM onmove or onresize event, as well as 2) a SelectAll command and 3) the DOM appendChild method can be used to trigger the vulnerability. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft IE Behavior URL Use-after-free Vulnerability	CWE: 119 CVE: 2014-0303 BID: 66028	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability is triggered when an attempt is made to access a previously deleted object while processing behavior behavior properties within an html body element. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.

Name	References	Description
Strike Microsoft Internet Explorer Use After Free CVE 2014-0305	CWE: 119 CVE: 2014-0305 BID: 66030	This strike exploits a use after free error triggered when Microsoft Internet Explorer handles DOM rewrites when processing certain web pages. If a user opens a specially crafted web page, on a vulnerable machine, a heap memory corruption is triggered that can lead to arbitrary code execution using local privileges. All versions of Internet Explorer 6 through 11.
Strike Microsoft IE TextRange Object Handling Use-After-Free Vulnerability	CWE: 119 CVE: 2014-0307 BID: 66032	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability lies in the handling of TextRange object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Adobe Flash SharedObject Use After Free	CWE: 399 CVE: 2014-0502 BID: 65702	This strike exploits a Use After Free vulnerability on Adobe Flash Player. The vulnerability can be triggered due to inadequate memory management when using a SharedObject entities. A user could be manipulated into accessing a web page that downloads and executes a malicious file that can lead to arbitrary code execution with local user privileges. All versions of flash player below 12.0.0.44 and 11.2.202.341 are affected.
Strike Novell GroupWise FileUploadServlet Directory Traversal	CWE: 200 CVE: 2014-0600 BID: 69424	This strike exploits a directory traversal vulnerability in Novell GroupWise. The vulnerability is due to improper validation of user supplied parameters in the fileUpload servlet. An unauthenticated attacker can exploit this vulnerability by sending a specially crafted request to the vulnerable server, leading to the disclosure and destruction of files in arbitrary locations on the server. NOTE: By default the vulnerable services are accessed via SSL connection (port 9710).
Strike Attachmate Reflection FTP Client ActiveX GetGlobalSettings Memory Corruption	CWE: 94 CVE: 2014-0603	This strike exploits an ActiveX control vulnerability associated with the AttachMate EXTRA!, INFOConnect and Reflection software suites. If a user opens a specially crafted web page, by instantiating a specialized ActiveX control, a memory corruption vulnerability may occur that could lead to code execution. All versions of Attachmate INFOConnect Enterprise prior to 9.2.0.1182 or Attachmate Reflection FTP Client prior to 4.1.420.0 are vulnerable.
Strike Cross-Site Scripting Vulnerability In Novell GroupWise WebAccess	CWE: 79 CVE: 2014-0611 BID: 76008	This strike exploits a cross-site scripting vulnerability in Novell GroupWise WebAccess. The vulnerability is due to improper validation while processing email attachments. An attacker could exploit this vulnerability in order to run malicious scripts on the target machine.
Strike Advantech WebAccess SCADA webvact.ocx GotoCmd Buffer Overflow	CWE: 119 CVE: 2014-0765 BID: 66722	This strike exploits a security vulnerability inside Advantech WebAccess which can lead to remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Advantech WebAccess SCADA webvact NodeName2 Buffer overflow	CWE: 119 CVE: 2014-0766 BID: 66725	This strike exploits a buffer overflow vulnerability inside Advantech WebAccess SCADA which can lead to arbitrary code execution in the context of the logged in user.
Strike Advantech WebAccess SCADA webvact AccessCode Buffer overflow	CWE: 119 CVE: 2014-0767 BID: 66728	This strike exploits a buffer overflow vulnerability inside Advantech WebAccess SCADA which can lead to arbitrary code execution in the context of the logged in user.
Strike Advantech WebAccess SCADA webvact AccessCode2 Buffer overflow	CWE: 119 CVE: 2014-0768 BID: 66732	This strike exploits a buffer overflow vulnerability inside Advantech WebAccess SCADA which can lead to arbitrary code execution in the context of the logged in user.
Strike Advantech WebAccess BWOXRUN.Bwocxr unCtrl ActiveX Code Execution vulnerability	CVE: 2014-0773 BID: 66742	This strike exploits a remote code execution vulnerability in Advantech WebAccess. The vulnerability lies within the CreateProcess method used by the bwocxrun.ocx ActiveX Control. By enticing a user to open a crafted web page an attacker could remotely execute arbitrary code.
Strike IBM SPSS Sample Power Vsflex8l Combolist Buffer Overflow	CWE: 119 CVE: 2014-0895 BID: 66116	This strike targets a vulnerability inside IBM SPSS SamplePower that exist due to improper boundary checking and which could lead to code execution in the context of the user targeted by the attack. The attack is carried out through Vsflex8l ActiveX control
Strike WordPress WP Symposium Plugin Arbitrary File Upload	CVE: 2014-10021 BID: 71686	This strike exploits a file upload vulnerability in Wordpress WP Symposium Plugin version 14.11. The vulnerability is due to lack of sanitization of the user-uploaded files in UploadHandler.php. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary code by uploading files on the server and execute them.
Strike SOAPUI Remote Code Execution	CWE: 94 CVE: 2014-1202	This strike exploits a vulnerability inside the SOAPUI testing suite. Specifically, if a user is tricked into accessing a specially formatted WSDL document, local code execution may be achieved. All versions of SOAPUI prior to 4.6.4 are affected.

Name	References	Description
Strike Mozilla Firefox TypeObject Use After Free	CWE: 399 CVE: 2014-1512 BID: 66209	This strike exploits a use after free vulnerability in Mozilla Firefox. The vulnerability occurs while handling TypeObjects within the JavaScript engine. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim's machine.
Strike Mozilla Firefox SharedWorker Port Close Use After Free	CVE: 2014-1548 BID: 68818	This strike exploits a use after free vulnerability in Mozilla Firefox. If a SharedWorker is created then has its MessagePort closed, the pointer is left but the object is removed by the garbage collector. The dangling pointer can be accessed, creating a use after free condition.
Strike Mozilla Firefox SVG Animation Use After Free	CWE: 416 CVE: 2014-1563 BID: 69523	This strike exploits a Use After Free vulnerability in Mozilla Firefox. The vulnerability is due to a flaw in the handling of SVG objects embedded in web pages. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, leading to execution of arbitrary code on the victim system.
Strike CenturyStar ActiveX Control SetMyAddress BO	CWE: 787 CVE: 2014-1598	This strike exploits buffer overflow vulnerability within CenturyStar 7.12 ActiveX Control. This vulnerability is due to lack of boundary checking in the CenturyStar 7.12 ActiveX Control. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system.
Strike Belkin N750 DB Wi-Fi Gigabit Router Buffer Overflow	CWE: 119 CVE: 2014-1635 EXPLOITDB : 35184 BID: 70977	This strike exploits a buffer overflow vulnerability inside Belkin's N750 DB Wi-Fi router. If exploited the vulnerability results in command execution in the context of the root user which effectively grants full access of the device to the attacker.
Strike Mitsubishi EZPcAut260.dll ActiveX Control ESOOpen Buffer Overflow	CVE: 2014-1641	This strike exploits buffer overflow vulnerability within Mitsubishi EZPcAut260.dll ActiveX Control. This vulnerability is due to lack of boundary checking in the function ESOOpen in Mitsubishi EZPcAut260.dll ActiveX Control. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system.
Strike Symantec LiveUpdate Administrator Security Bypass	CWE: 255 CVE: 2014-1644 BID: 66399	This strike identifies a security policy bypass vulnerability in Symantec LiveUpdate Administrator. When processing a Post request, the temporary passwords are not properly validated allowing for a malicious user to take advantage of the reset old password feature to force a reset and create user account information.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Symantec Workspace Streaming xmlrpc ManagementAgentServer Arbitrary File Upload	CWE: 264 CVE: 2014-1649 BID: 67189	This strike exploits an arbitrary file upload vulnerability in Symantec Workspace Streaming. An attacker can send a specially crafted HTTP POST message with an XML_RPC call to ManagementAgentServer to upload an arbitrary file onto the target. Successful exploitation could result in arbitrary file creation or file overwrite.
Strike Symantec Web Gateway clientreport.php SQL Injection	CWE: 89 CVE: 2014-1651 BID: 67754	This strike exploits an SQL injection vulnerability in Symantec Web Gateway management console versions prior to 5.2. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure, database corruption, denial of service and others.
Strike SkyBlueCanvas CMS Un-Authenticated Command Execution	CWE: 134 CVE: 2014-1683 BID: 65129	This strike identifies a vulnerability in SkyblueCanvas CMS that allows for command execution by sending a request to the vulnerable CMS application. The parameters "name", "email", "subject", and "message" are not properly validated, therefore allowing an unauthenticated user to issue malicious commands.
Strike Google Chrome V8 Javascript ArrayBuffer Memory Corruption Vulnerability	CWE: 119 CVE: 2014-1705 BID: 66239	This strike exploits a memory corruption vulnerability in Google Chrome. The vulnerability can be exploited by overwriting a function for accessing a TypedArray property. By enticing a user to open a malicious web page, an attacker could exploit this vulnerability to execute arbitrary code on the client system.
Strike Microsoft IE removeAttribute Use-after-free Vulnerability	CWE: 399 CVE: 2014-1765 BID: 66244	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability is triggered when an attempt is made to access a previously deleted style attribute. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft Internet Explorer Object OnError CTreePos Use After Free	CWE: 119 CVE: 2014-1772 BID: 67864	This strike exploits a use after free vulnerability in Microsoft Internet Explorer. The vulnerability is caused by improper management of resources during event handling by the Internet Explorer engine. A remote attacker could entice the user to access a crafted HTML page, potentially obtaining code execution in the context of the user accessing the page.
Strike Microsoft Internet Explorer PushClipRect Array Indexing Memory Corruption	CWE: 119 CVE: 2014-1773 BID: 67866	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. An attacker can entice a target to visit an HTML page with a specially crafted canvas object to trigger the vulnerability. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer CPeerFactoryUrlMap Use-after-free Vulnerability	CWE: 119 CVE: 2014-1775 BID: 67871	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability is triggered when attempting to access a deleted CPeerFactoryUrlMap object. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Microsoft IE VML Object Handling Use-After-Free Vulnerability	CWE: 416 CVE: 2014-1776 BID: 67075	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability lies in the handling of VML groups. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Internet Explorer replaceNode Memory Corruption	CWE: 119 CVE: 2014-1789 BID: 67881	This strike exploits a Memory Corruption vulnerability in Internet Explorer. The vulnerability is due to error while dynamically replacing DOM nodes. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike CVE-2014-1791 Microsoft Internet Explorer Memory Corruption	CWE: 119 CVE: 2014-1791 BID: 67884	This strike exploits a use after free memory corruption vulnerability inside Microsoft Internet Explorer. The vulnerability can be triggered by enticing a user to access a malicious website and could result in remote code execution. If code execution is achieved, it will be run in the context of the user.
Strike Microsoft Internet Explorer createTextRange Page Hide Use After Free	CWE: 119 CVE: 2014-1795 BID: 67887	This strike exploits a use after free vulnerability in Microsoft Internet Explorer. The createTextRange command creates a CMarkup object. This object gets deleted on page hide. The onpagehide command can execute calls on page hide, including manipulating the deleted CMarkup object, causing a use after free condition. Successful exploitation may result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer Marquee Object Use After Free	CWE: 119 CVE: 2014-1815 BID: 67301	This strike exploits a Use-After-Free vulnerability in Microsoft Internet Explorer. The vulnerability is due to an error while handling marquee objects within HTML pages. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim's machine.
Strike Mitsubishi EZPcAut220 ActiveX Control HostAddress Buffer Overflow	CVE: 2014-1847	This strike exploits buffer overflow vulnerability within Mitsubishi EZPcAut220.dll ActiveX Control. This vulnerability is due to lack of boundary checking in the attribute HostAddress in Mitsubishi EZPcAut220.dll ActiveX Control. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Schneider Electric ClearSCADA 2013R1.2 GetOPCServers ActiveX Control BO	CVE: 2014-1848	This strike exploits buffer overflow vulnerability within Schneider Electric ClearSCADA 2013R1.2 ActiveX Control. This vulnerability is due to lack of boundary checking in the Schneider Electric ClearSCADA 2013R1.2 ActiveX Control. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system.
Strike Mitsubishi ActiveX Control EZPcAut280.dll KeywordSet Argument Buffer Overflow	CVE: 2014-2074	A buffer overflow vulnerability exists in Mitsubishi ActiveX Control EZPcAut280.dll. The vulnerability is due to a boundary error in while parsing arguments passed to the KeywordSet argument.
Strike CA ERwin Web Portal ProfileIconServlet Directory Traversal	CWE: 22 CVE: 2014-2210 BID: 66644	This strike exploits a directory traversal vulnerability in CA ERwin Web Portal. The parameters fileName and customImageName are not sanitized for directory traversal characters in requests to ProfileIconServlet. Successful exploitation can result in disclosure of arbitrary files.
Strike Vtiger CRM Unauthenticated Password Reset	CWE: 20 CVE: 2014-2269 BID: 66757	This strike identifies a vulnerability in Vtiger's web-based Customer Relationship Management system. Due to a lack of user restriction on the changePassword function an unauthenticated user can alter the password of the administrator account.
Strike PHP Libmagic Executable PE Selection Table Entry Out of Bounds Memory Access	CWE: 119 CVE: 2014-2270	This strike exploits an out of bounds memory access vulnerability in PHP Libmagic. An executable file with a specially crafted PE selection table entry can cause an integer overflow when calculating the memory address. This will bypass verification, allowing for access of an out of bounds memory location. Successful exploitation can result in execution of arbitrary code or abnormal termination of PHP, resulting in a denial of service condition.
Strike EMC CMCNE FileUploadController FILELOCATION Directory Traversal	CWE: 264 CVE: 2014-2276 BID: 66308	This strike exploits a directory traversal vulnerability in EMC Connectrix Manager Converged Network Edition (CMCNE). CMCNE does not sanitize "../" in the FILELOCATION header in requests to /inmservlets/FileUploadController for directory traversal characters. A specially crafted HTTP request can be sent to gain access to files normally not accessible.
Strike Digium Asterisk Cookie Stack Overflow CVE-2014-2286	CWE: 20 CVE: 2014-2286 BID: 66093	This strike exploits a vulnerability inside Digium Asterisk that allows stack overflow through the Cookie header inside HTTP GET requests. This vulnerability could be leveraged conduct denial of service attacks

Name	References	Description
Strike Atlassian Jira Issue Collector Directory Traversal	CWE: 22 CVE: 2014-2314 BID: 65849	This strike exploits a vulnerability in the Atlassian JIRA software suite. It allows a remote unauthenticated attacker to upload a file to random location on the file system by exploiting a directory traversal vulnerability. All versions of JIRA prior to 6.0.3 are vulnerable.
Strike ZTE F460-F660 cable modem web_shell_cmd.gch Command Injection	CWE: 264 CVE: 2014-2321	This strike exploits a command execution vulnerability in ZTE F460/F660 cable modem Web Interface. The vulnerability is due to improper access checks of the web platform resources. Successful exploitation can result in arbitrary commands on the target system.
Strike Lighttpd Host Header mod_simple_vhost directory traversal	CWE: 22 CVE: 2014-2324 BID: 66157	This strike exploits a vulnerability in the Lighttpd Web Server. Due to insufficient input validation, a malicious user may send a request with a specially crafted Host header and generate a directory traversal. All versions of Lighttpd Project Lighttpd prior to 1.4.35 are vulnerable.
Strike Oracle Data Quality PostcardPreviewInt Onclose Untrusted Pointer Dereference	CVE: 2014-2415	This strike exploits an untrusted pointer dereference vulnerability inside Oracle Data Quality. The vulnerability can be exploited to gain arbitrary code execution on the target system in the context of the logged in user.
Strike Oracle Data Quality DateTimeWrapper onchange Untrusted Pointer Dereference	CVE: 2014-2416	This strike exploits a pointer dereference vulnerability inside Oracle Data Quality. The vulnerability could provide attackers with remote code execution in the security context of the logged in user.
Strike Oracle Data Quality onloadstatechange Pointer Dereference	CVE: 2014-2417 BID: 66841	This strike exploits a pointer dereference vulnerability in Oracle Data Quality. The onloadstatechange property of the TSS12.DscXB.XB ActiveX control expects a function and does not check type of data it is passed. Passing in a different type can result in invalid memory access. Successful exploitation may result in read/write to arbitrary memory, arbitrary code execution, or abnormal termination of the web browser.
Strike Oracle Data Quality FileChooserDlg onChangeDirectory Untrusted Pointer Dereference	CWE: 822 CVE: 2014-2418	A remote code execution vulnerability exists in Oracle Data Profiling and Data Quality for Data Integrator. The vulnerability is due to dereferencing an arbitrary pointer within the TSS12.DscTools.FileChooserDlg ActiveX control. A remote attacker can exploit this vulnerability by enticing a user to open a malicious web page. Successful exploitation could result in arbitrary code execution in the context of the currently logged on user.
Strike Oracle Event Processing FileUploadServlet filename Parameter Directory Traversal	CVE: 2014-2424 BID: 66871	This strike exploits a directory traversal exploit in Oracle Event Processing. When processing multipart messages sent to FileUploadServlet, the filename parameter is not sanitized for directory traversal characters. Successful exploitation can result in creation or overwrite of arbitrary files.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike LibYAML scanner yasml_parser_scan_uri_escapes Heap Bufferoverflow	CWE: 119 CVE: 2014-2525 BID: 66478	This strike exploits a vulnerability in the LibYAML open source library. Due to improper memory management, when handling Uri encoded tag elements, opening a specially formatted YAML file will cause a heap overflow that could potentially lead to code execution. All versions of the LibYAML library prior to 0.1.5 are vulnerable
Strike HP SiteScope EmailServlet webinfra_emailFileName Directory Traversal	CWE: 287 CVE: 2014-2614 BID: 68361	This strike exploits a directory traversal vulnerability in HP SiteScope. The webinfra_emailFileName parameter in http requests to /SiteScope/EmailServlet is not sanitized for directory traversal characters. A specially crafted HTTP request can be sent to a vulnerable server to access information not normally accessible.
Strike HP Universal CMDB Default Credentials Arbitrary File Upload	CVE: 2014-2617 BID: 68363	This strike exploits a code execution vulnerability in HP Universal CMDB. The vulnerability is due to the use of hard-coded credentials with administrator rights. By exploiting this vulnerability, an attacker can upload files on the server using the hard-coded credentials and execute code with SYSTEM privileges.
Strike HP Intelligent Management Center Branch Intelligent Management Software Directory Traversal	CVE: 2014-2618 BID: 68540	This strike exploits a directory traversal vulnerability in HP Intelligent Management Center (IMC) Branch Intelligent Management Software (BIMS). When processing the fileName parameter in an HTTP request, BIMS does not sanitize for directory traversal characters. Successful exploitation can result in disclosure of arbitrary files on the target machine.
Strike HP Intelligent Management Center SyslogDownloadServlet Information Disclosure	CVE: 2014-2619 BID: 68543	This strike exploits a directory traversal vulnerability inside HP Intelligent Management Center which can be attacked through the SyslogDownloadServlet resource. If exploited the vulnerability could result in arbitrary file disclosure.
Strike HP Intelligent Management Center FaultDownloadServlet Information Disclosure	CVE: 2014-2620 BID: 68544	This strike exploits a vulnerability in the HP Intelligent Management Center. Due to insufficient input validation, a malicious user may send a request with a specially crafted URL that generates directory traversal conditions and may allow access to any file on the system. All versions of HP Intelligent Management Center prior to 7.0 are vulnerable.
Strike HP Intelligent Management Center ICTDownloadServlet Information Disclosure	CVE: 2014-2621 BID: 68546	This strike exploits an information disclosure vulnerability inside HP Intelligent Management Center. The vulnerability is available due to improper validation of input parameters and can be accessed through the ICTDownload servlet. If exploited the vulnerability grant read access to all files on the targeted system.
Strike HP Network Virtualization toServerObject Directory Traversal	CWE: 22 CVE: 2014-2626 BID: 68851	This strike exploits a directory traversal vulnerability inside HP Network Virtualization. The vulnerability allows arbitrary file upload on the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP Sprinter Tidestone Formula ActiveX SwapTables Memory Corruption	CVE: 2014-2635 BID: 70354	This strike exploits a memory-corruption vulnerability in an HP Sprinter ActiveX control. The vulnerability is due to a failure to sanitize user-supplied input, allowing a user to pass part of a memory address as a method parameter to the SwapTables method. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim system.
Strike HP Sprinter Tidestone Formula ActiveX AttachToSS Memory Corruption	CVE: 2014-2636 BID: 70358	This strike exploits a memory-corruption vulnerability in an HP Sprinter ActiveX control. The vulnerability is due to a failure to sanitize user-supplied input, allowing a user to pass part of a memory address as a method parameter to the AttachToSS method. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim system.
Strike HP Sprinter Tidestone Formula ActiveX Multiple Memory Corruption	CVE: 2014-2637 BID: 70357	This strike exploits a memory-corruption vulnerability in an HP Sprinter ActiveX control. The vulnerability is due to a failure to sanitize user-supplied input, allowing a user to pass part of a memory address as a method parameter to the CopyRange and CopyRangeEx methods. By enticing a user to view a malicious web page, an attacker could execute arbitrary code on the victim system.
Strike HP Sprinter Tidestone Formula One ActiveX DefaultFontName Buffer Overflow	CVE: 2014-2638	This strike exploits a flaw in HP Sprinter that results in execution of arbitrary code triggered by manipulation of object property in ActiveX controls.
Strike Microsoft Internet Explorer TextArea Use After Free	CWE: 119  CVE: 2014-2782  BID: 68101	This strike exploits a Use-After-Free vulnerability in Internet Explorer. The vulnerability is due to an attempt to use a TextArea object after it has been improperly deleted. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike Microsoft IE History Use-after-free Vulnerability	CWE: 119  CVE: 2014-2804  BID: 68386	This strike exploits a use-after-free vulnerability in Microsoft Internet Explorer (IE). The vulnerability is triggered when a modifying the browser history state. By enticing a user to view a malicious web page, an attacker can remotely execute arbitrary code.
Strike Internet Explorer CDOMUIEvent Memory Corruption	CWE: 119  CVE: 2014-2820  BID: 69116	This strike exploits a Memory Corruption vulnerability in Internet Explorer. The vulnerability is due to an error while processing events using the dispatchEvent method. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apple CUPS Web Interface URL XSS	CWE: 79 CVE: 2014-2856 BID: 66788	This strike exploits a reflected XSS vulnerability inside CUPS which can lead to information disclosure on the target's machine. The vulnerability is present due to poor input validation inside the URL and can lead to exposure of sensitive data residing on the client, like session cookies
Strike F5 Multiple Products iControl API hostname remote command execution	CVE: 2014-2928 BID: 67278	This strike exploits a remote command execution vulnerability in multiple F5 products. The vulnerability is due to lack of validation of user supplied input in set_hostname SOAP requests. An unauthenticated remote attacker can exploit this vulnerability by sending specially crafted SOAP allowing the attacker to execute shell commands on the vulnerable server. NOTE: By default the vulnerable services are accessed via SSL connection (port 443).
Strike Belkin Router N150 Path Traversal	CWE: 22 CVE: 2014-2962 BID: 68085 EXPLOITDB : 38488	This strike exploits an absolute path traversal vulnerability in the webproc cgi module on the Belkin N150 router. This vulnerability could allow remote attackers to read arbitrary files via a full pathname in the HTTP getpage parameter.
Strike Sixnet Sixview Web Console Directory Traversal	CWE: 22 CVE: 2014-2976 BID: 67032	The strike exploits a directory traversal vulnerability inside Sixnet SixView Manager 2.4.1 that allows remote attackers to read arbitrary files by specifying traversal characters.
Strike Acunetix 8 Remote Stack Based Buffer Overflow	CWE: 119 CVE: 2014-2994 BID: 67058	This strike exploits a vulnerability inside Acunetix Web Application Vulnerability Scanner 8. The vulnerability can be exploited by supplying a specially crafted website as the scanner's target and can result in remote code execution.
Strike ElasticSearch Dynamic Script Arbitrary Java Execution Vulnerability	CWE: 284 CVE: 2014-3120 BID: 67731	This strike exploits a remote code execution vulnerability in ElasticSearch. The vulnerability is due to a design flaw allowing code execution as part of query. Exploiting this vulnerability could allow remote, unauthenticated attackers to execute arbitrary code on the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Symantec Endpoint Protection Manager Cross-Site Scripting Vulnerabilities	CWE: 79 CVE: 2014-3438 BID: 70844	This strike exploits one of two reflected Cross-Site Scripting (XSS) vulnerabilities in Symantec Endpoint Protection Manager. The vulnerabilities are due to improper sanitization of parameters prior to presenting content to the user. A remote attacker could exploit these vulnerabilities by enticing a user to follow a malicious link, which could result in arbitrary execution of script code. NOTE: Communication with the Javascript-based console is via HTTPS (TCP/8443)
Strike SAP Sybase Event Stream Processor XML-RPC ConnectionType Unsafe Pointer Dereference	CVE: 2014-3457 BID: 67585	This strike exploits an unsafe pointer dereference vulnerability in SAP Sybase Event Stream Processor. An HTTP POST request with a specially crafted XML-RPC command can be used to cause the program to dereference an arbitrary memory location. Successful exploitation can result in execution of arbitrary code or abnormal termination of the esp_parse service.
Strike Sybase Event Stream Processor Connection Pointer Dereference	CVE: 2014-3458 BID: 67587	This strike exploits unsafe pointer dereference vulnerabilities in SAP Sybase Event Stream Processor ESP Studio. The XML-RPC methods Connection.getErrors and Connection.getType both accept user-supplied input as pointer to a location in memory. By sending specially crafted XML-RPC commands an attacker could cause a Denial of Service condition.
Strike PHP Unserialize SplObjectStorage and ArrayObject Member Array Memory Corruption	CVE: 2014-3515 BID: 68237	This strike exploits a memory corruption vulnerability in PHP. When PHP attempts to deserialize a specially crafted serializable object a type confusion will occur, resulting in memory corruption. Successful exploitation may result in arbitrary code executions with the privileges of the PHP application or abnormal program termination.
Strike Squid Range Header Denial of Service	CWE: 20 CVE: 2014-3609 BID: 69453	This strike exploits a vulnerability in the Squid proxy which can be exploited due to improper validation of input parameters. The vulnerability can be triggered through Range headers inside the requests. The vulnerability can be exploited remotely and results in a denial of service condition.
Strike PHP Core Unserialize Calls Object Length Integer Overflow	CWE: 189 CVE: 2014-3669 BID: 70611	This strike exploits an integer overflow vulnerability in PHP. When processing serializable objects, the value of the DataLen fields of a class object is not verified. A sufficiently large DataLen value will cause an integer overflow, which may result in memory corruption. Successful exploitation may result in execution of arbitrary code with the privileges of the PHP application or abnormal termination of the PHP application, resulting in a denial of service condition.
Strike Drupal 7 Preauth SQL Injection	BID: 70595 CWE: 89 CVE: 2014-3704	This strike exploits a vulnerability in Drupal 7 versions pre 7.32 which allows malicious users to perform unauthenticated SQL injection attacks. When exploited, the vulnerability can result in complete compromise of the target website.

Name	References	Description
Strike Cogent DataHub Web Server GetPermissions Command Injection	CWE: 94 CVE: 2014-3789 BID: 67486	This strike exploits a vulnerability inside Cogent DataHub Web Server that allows an attacker to execute commands in the context of the DataHub process. The vulnerability exists due to improper validation of input parameters passed to the authenticate function
Strike Centreon and Centreon Enterprise Server SQL Injection	CWE: 89 CVE: 2014-3828 BID: 70648	This strike exploits an SQL injection vulnerability in Centreon versions 2.5.2 and prior and Centreon Enterprise Server versions 2.2 and prior, as well as 3.0. The vulnerability is caused by improper sanitization of parameters passed in requests to multiple application pages. An unauthenticated remote attacker could exploit this vulnerability by sending crafted packets to the application, resulting in the injection of SQL commands to the underlying database.
Strike Centreon and Centreon Enterprise Server Remote Command Injection	CWE: 94 CVE: 2014-3829 BID: 70649	This strike exploits a remote command injection vulnerability in Centreon versions 2.5.2 and prior and Centreon Enterprise Server versions 2.2 and prior, as well as 3.0. The vulnerability is caused by improper sanitization of the template_id and session_id parameters in displayServiceStatus.php, as well as improper escaping of a shell argument field. An attacker may resort to SQL injection on these fields in order to bypass security checks and prepare a command for subsequent execution. Successful exploitation depends upon a user (any user) being logged in to the application during the attack and will result in remote command execution.
Strike Samsung iPOLiS Device Manager FindConfigChildeKeyList Stack Buffer Overflow	CWE: 119 CVE: 2014-3912 BID: 67823	This strike exploits a Samsung iPOLiS Device Manager vulnerability which is due to improper bound validation in the FindConfigChildeKeyList method. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Rocket Servergraph Admin Center fileRequest Arbitrary File Creation	CWE: 22 CVE: 2014-3914 BID: 67779	This strike exploits a arbitrary file creation vulnerability present in Rocket Servergraph Admin Center. The vulnerability is present due to lack of checks on user supplied data and can be exploited through the use of fileRequest resources. Successfull exploitation can result in arbitrary code execution on the target machined in the context of the SYSTEM user.
Strike Rocket Servergraph Admin Center run and runClear Command Execution	CWE: 22 CVE: 2014-3914	This strike exploits a command execution vulnerability present in Rocket Servergraph Admin Center. The vulnerability is present due to lack of checks on user supplied data and can be exploited through the use of fileRequest resource. Successful exploitation can result in arbitrary code execution on the target machined in the context of the SYSTEM user.

Name	References	Description
Strike Rocket Servergraph Admin Center userRequest and tsmRequest Command Execution	CWE: 94 CVE: 2014-3915 BID: 67780	This strike exploits a arbitrary command execution present in Rocket Servergraph Admin Center. The vulnerability is present due to lack of checks on user supplied data and can be exploited through the use of tsmRequest and userRequest resources. The command gets executed in the context of the System user.
Strike D-Link HNAP HTTP POST Content Stack Buffer Overflow	CWE: 119 CVE: 2014-3936 BID: 67651	This strike exploits a stack overflow vulnerability in multiple D-Link devices using Home Network Administration Protocol (HNAP). When processing an HNAP request, the vulnerable devices copy the request content to a fixed buffer without validating the size. Successful exploitation may result in attacker control of the vulnerable device.
Strike Multiple ManageEngine Products LinkViewFetchServlet SQL Injection	CWE: 89 CVE: 2014-3996 BID: 69305	This strike exploits a SQL injection vulnerability in multiple ManageEngine products. The vulnerability is due to improper sanitization of a parameter in LinkViewFetchServlet. By exploiting this vulnerability, an attacker can inject SQL commands and execute code on the target server.
Strike Internet Explorer first-letter element styling Memory Corruption	CWE: 119 CVE: 2014-4050 BID: 69125	This strike exploits a Memory Corruption vulnerability in Internet Explorer. The vulnerability is due to an error while handling CSS pseudo-objects. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the target machine.
Strike Microsoft Internet Explorer CSegment Use After Free	CWE: 119 CVE: 2014-4063 BID: 69132	This strike exploits a use after free vulnerability in Internet Explorer. If the style attribute function executes selectAll and the onreadystatechange event executes selectAll and indent, a CSegment object is deleted and later accessed, creating a use after free condition. Successful exploitation could result in execution of arbitrary code.
Strike Microsoft XML Core Services XML Content Parsing Memory Corruption	CWE: 94 CVE: 2014-4118 BID: 70957	This strike exploits a flaw in Microsoft XML Core Services. The vulnerability is due to an uninitialized variable while processing the value of the priority element in xsl:template. By exploiting this vulnerability, an attacker can determine arbitrary code execution.
Strike Microsoft .NET System.dll iriParsing Remote Code Execution	CWE: 399 CVE: 2014-4121 BID: 70351	This strike exploits a heap corruption vulnerability in Microsoft .NET Framework. The vulnerability is due to an integer underflow occurring while Internationalized Resource Identifier (IRI) elements are processed. A remote, unauthenticated attacker can execute arbitrary code in the context of .NET web application by sending crafted IRI strings to the vulnerable server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer onerror CTitleElement Use After Free	CWE: 20 CVE: 2014-4130 BID: 70332	This strike exploits a use after free error in Microsoft Internet Explorer. A specially crafted webpage can free and then attempt to access the MSHTML!CTitleElement Object. Successful exploitation can lead to execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer basefont ASLR Bypass	CWE: 264 CVE: 2014-4140 BID: 70325	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. An attacker can entice a target to visit an HTML page with a specially crafted basefont tag to trigger the vulnerability. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike SENKAS Kolibri Webserver Request Buffer Overflow	CWE: 119 CVE: 2014-4158 BID: 68195 EXPLOITDB : 33027	This strike exploits a buffer overflow vulnerability in Kolibri webserver. The overflow can be triggered through GET and HEAD requests and can result in remote code execution.
Strike Manage Engine Desktop Central Arbitrary File Upload	CWE: 22 CVE: 2014-5005 BID: 69494	This strike exploits a vulnerability in Manage Engine Desktop Central product which allows arbitrary file upload. The vulnerability exists due to lack of parsing of directory traversal characters.
Strike ManageEngine Desktop Central Directory Traversal	CWE: 22 CVE: 2014-5006 BID: 69493	This strike exploits a directory traversal vulnerability in ManageEngine Desktop Central. The vulnerability is due to improper validation of the filename parameter in mdmLogUploader. By exploiting this vulnerability, an attacker can upload files to arbitrary locations on the server and execute code.
Strike OSSIM AlienVault av-centerd Util.pm remote_task Arbitrary Command Execution	CWE: 94 CVE: 2014-5210 BID: 69239	This strike exploits a vulnerability in the OSSIM AlienVault software suite. By sending a specially crafted SOAP request an unauthenticated attacker can execute commands on a vulnerable system. All AlienVault versions prior to 4.7.0 are vulnerable.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Novell eDirectory rdn Parameter Cross Site Scripting	CWE: 79 CVE: 2014-5212 BID: 71741	This strike exploits a memory corruption vulnerability in Novell eDirectory. In HTTP requests to /nds/search/data, the rdn parameter is not properly sanitized. An attacker could place arbitrary script codes into the parameter, which will then be executed with the privileges of the current browser session.
Strike Drupal Core XML-RPC Excessive Parameter Tags Denial of Service	CWE: 399 CVE: 2014-5266 BID: 69146	This strike exploits a denial of service vulnerability in Drupal Core. Due to how Drupal Core parses XML, an XML-RPC request with excessive parameter tags can cause CPU and memory exhaustion, causing a denial of service condition.
Strike ManageEngine Multiple Products FileAttachment directory traversal	CWE: 22 CVE: 2014-5301	This strike exploits a directory traversal vulnerability in multiple ManageEngine products. The vulnerability is due to improper validation of the path parameter when uploading files to the server. By exploiting this vulnerability, an authenticated attacker can upload files to arbitrary locations on the server and execute them.
Strike ManageEngine Multiple Products FileCollector doPost Directory Traversal	CWE: 22 CVE: 2014-6034	This strike exploits a remote arbitrary file upload vulnerability inside ManageEngine. The vulnerability exists due to improper sanitization of input characters and can lead to arbitrary code execution in the context of the System user.
Strike Manage Engine Multiple Products File Collector Directory Traversal	CWE: 22 CVE: 2014-6035 BID: 70169	This strike exploits a vulnerability in multiple Manage Engine products which allows arbitrary file upload. The vulnerability exists due to lack of parsing of directory traversal characters.
Strike ManageEngine Multiple Products multipartRequest Directory Traversal	CWE: 22 CVE: 2014-6036 BID: 70172	This strike exploits a vulnerability inside multiple products from the Manage Engine suite which allows arbitrary file execution. The vulnerability is due to lack of authentication controls and directory traversal vulnerabilities.
Strike ManageEngine EventLog Analyzer agentUpload Directory Traversal	CWE: 22 CVE: 2014-6037 BID: 69482	This strike exploits a code execution vulnerability inside ManageEngine EventLog Analyzer. The vulnerability allows remote unauthenticated attackers to upload files to arbitrary locations and grants execution abilities with System privileges.

Name	References	Description
Strike ManageEngine EventLog Analyzer agentHandler Information Disclosure	CWE: 200  CVE: 2014-6038  BID: 70959	This strike exploits an information disclosure inside ManageEngine EventLog Analyzer. The vulnerability is exploited through the agentHandler servlet and allows remote unauthenticated information disclosure from within the databases available inside the application.
Strike ManageEngine EventLog Analyzer Hostdetails Information Disclosure	CVE: 2014-6039  BID: 70960	This strike exploits an information disclosure inside ManageEngine EventLog Analyzer. The vulnerability is exploited through the agentHandler servlet and allows remote unauthenticated information disclosure in regard to the details of the server hosting the application.
Strike Google Android Browser Same Origin Policy Bypass	CWE: 264  CVE: 2014-6041  BID: 69548	This strike exploits a vulnerability inside Google's Android browser which allows violation of the same origin policy bypass. The vulnerability can be exploited through the use of window.location property and can result in session takeover.
Strike Zenoss Core Version Check Remote Code Execution	CWE: 94  CVE: 2014-6261  BID: 71528	This strike exploits a remote code execution vulnerability in Zenoss Core. The flaw is due to a lack of authentication validation by the Zenoss Core Server during an update check. A remote unauthenticated attacker could exploit this vulnerability by enticing an authenticated user to perform an update check and spoofing a response, which could lead to arbitrary code execution on the target server.
Strike GNU Bash Trailing Characters After Function Definitions in Environment Variables Apace CGI Scripts	CWE: 78  CVE: 2014-6271  BID: 70103	This strike exploits a vulnerability in the GNU Bash which allows an attacker to execute arbitrary commands by providing them as trailing characters to an environment variable which holds a bash function. This strike exploits this vulnerability through Apache's mod_cgi module. If exploited the vulnerability results in remote code execution in the context of the user running the Apache process.
Strike Rejetto HTTP FileServer Remote Code Execution	CWE: 94  CVE: 2014-6287	This strike exploits a design weakness vulnerability in Rejetto HTTP FileServer. The vulnerability is due to improper validation of user supplied input. The findMacroMarker function in parserLib.pas allows an attacker to execute arbitrary programs via a null byte sequence in a search action. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the file server and might result in remote code execution.
Strike Microsoft Windows OLE Array Resize Memory Corruption	CWE: 119  CVE: 2014-6332  BID: 70952	This strike exploits a memory corruption vulnerability in Microsoft Windows OLE. VBScript has a function, redim preserve, which resizes an array while preserving the contents. If this is used with a very large value, it will trigger an error but not return the array to the original size, allowing read/write access outside the initial array bounds. A specially crafted HTML page can be used to trigger this vulnerability. Successful exploitation can result in execution of arbitrary code or abnormal termination of the browser.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer Data Prefix Memory Corruption	CWE: 399 CVE: 2014-6347 BID: 70347	This strike exploits a memory corruption vulnerability in Internet Explorer. The vulnerability is due to type-confusion when a DOMStringMap object is assigned to a text node property. An attacker could remotely execute arbitrary code by enticing a victim to view a malicious web page.
Strike Microsoft Internet Explorer CQuotes Use After Free Vulnerability	CWE: 399 CVE: 2014-6351 BID: 70323	This strike exploits a use-after-free vulnerability in Internet Explorer. The vulnerability occurs when an attempt is made to access a previously deleted CQuotes object. An attacker could remotely execute arbitrary code by enticing a victim to view a malicious web page.
Strike Internet Explorer base element Memory Corruption	CWE: 119 CVE: 2014-6366 BID: 71450	This strike exploits a Use-Afer-Free vulnerability in Internet Explorer. The vulnerability is due to an error triggered while processing dynamically added elements. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, causing arbitrary code to be executed on the victim system.
Strike GNU Bash Function Definitions in Environment Variables Apace CGI Scripts	CWE: 78 CVE: 2014-7169	This strike exploits a vulnerability in the GNU Bash also known as ShellShock which allows an attacker to execute arbitrary commands by providing them as functions to an environment variable. This strike exploits this vulnerability through Apache's mod_cgi module. If exploited the vulnerability results in remote code execution in the context of the user running the Apache process. NOTE: this vulnerability exists because of an incomplete fix for CVE-2014-6271.
Strike FreePBX Asterisk Recording Interface Cookie Unserialize Code Execution	CWE: 94 CVE: 2014-7235 BID: 70188	This strike exploits a code execution vulnerability in FreePBX Asterisk Recording Interface. The cookie ari_auth parameter receives a serialized PHP object which is not verified. An attacker can place a crafted serialized PHP object into the cookie ari_auth parameter to achieve code execution.
Strike ManageEngine Desktop Central DCPlugInServlet addPluginUser Policy Bypass	CWE: 264 CVE: 2014-7862 BID: 71849	This strike exploits a policy bypass vulnerability in ManageEngine Desktop Central. Authentication is not required to use the HTTP "action=addPlugInUser" parameter and value pair. An attacker may use this parameter to create and administrative account on the target system.
Strike ManageEngine Multiple Products Directory Traversal and File upload	CWE: 22 CVE: 2014-7866 BID: 71001	This strike exploits a directory traversal vulnerability in multiple ManageEngine products. The vulnerability is due to improper validation of the filename parameter. By exploiting this vulnerability, an attacker can upload files to arbitrary locations on the server and execute code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Multiple ManageEngine Products APMBVHandler and DataComparisonServlet SQL Injection	CWE: 89 CVE: 2014-7868 BID: 71002	This strike exploits a SQL Injection vulnerability in multiple ManageEngine products. The vulnerability is due to insufficient sanitization of parameters in APMBVHandler and DataComparisonServlet servlets. By exploiting this vulnerability, an attacker can execute arbitrary SQL queries on the server.
Strike HP Point of Sale OPOS Driver oposstoneindicator Open Method Stack Buffer Overflow	CVE: 2014-7890 BID: 72969	This strike exploits a HP Point of Sale PC OPOS Driver vulnerability which is due to improper bound validation in the oposstoneindicator component. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike HP Point of Sale OPOS Driver POSKeyboard Buffer Overflow	CVE: 2014-7891 BID: 72969	This strike exploits a HP Point of Sale PC OPOS Driver vulnerability which is due to improper bound validation in the OPOSPOSKeyboard component. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike PHP Core Unserialize KeyName Use After Free	CVE: 2014-8142 BID: 71791	This strike exploits a use after free vulnerability in PHP. When PHP attempts to deserialize a specially crafted serializable object, a use after free may occur. Successful exploitation may result in arbitrary code executions with the privileges of the PHP application or abnormal program termination.
Strike Honeywell OPOS Suite Open Method HWOPSSCANNER Stack Buffer Overflow	CWE: 119 CVE: 2014-8269 BID: 71642	This strike exploits one of two buffer overflow vulnerabilities in the HWOPSSCANNER.ocx or HWOPSScale.ocx ActiveX controls within the HoneyWell OPOS Suite. The vulnerabilities are due to failure of the vulnerable methods to check the boundaries of user supplied input. By enticing a user to view a specially crafted web page, an attacker can execute code in the security context of the running process.
Strike Realtek SDK - Miniigd UPnP SOAP Remote Code Execution	CWE: 20 CVE: 2014-8361	This strike exploits a remote code execution on Realtek SDK Miniigd UPnP SOAP service. This vulnerability is due to improper handling of the parameter under xml tag when a client sends SOAP traffic to the server. A remote unauthenticated attacker can exploit this vulnerability by sending crafted http requests to the target server. Successful exploitation results in remote code execution.
Strike Advantech WebAccess SCADA webeye.ocx ActiveX ip_address Parameter Buffer Overflow	CWE: 119 CVE: 2014-8388 BID: 71193	This strike exploits a stack buffer overflow vulnerability in Advantech WebAccess SCADA software. The flaw is due to insufficient validation of input to the ip_addr parameter by the webeye.ocx ActiveX control. By enticing a user to visit a malicious web page, arbitrary code can be executed on the client system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Visual Mining NetCharts Server HTTP Arbitrary File Upload	CWE: 434 CVE: 2014-8516 BID: 70895	This strike exploits an arbitrary file upload vulnerability in Visual Mining NetCharts Server. A specially crafted HTTP request can be sent to the server to upload arbitrary files. Further access to these files could lead to arbitrary code execution. This attack does require authentication, however there exist default, non-modifiable credentials in the software which can be used.
Strike NetBSD tnftp fetch.c fetch_url Command Execution	CWE: 77 CVE: 2014-8517 BID: 70792	This strike exploits a command execution vulnerability inside NetBSD tnftp client. The vulnerability is due to improper input validation of server supplied values and results in command execution in the context of the user running the client.
Strike Mozilla Firefox Proxy Prototype XrayWrapper Bypass Privilege Escalation	CWE: 94 CVE: 2014-8636 BID: 72041	This strike exploits a privilege escalation vulnerability in Mozilla Firefox. The vulnerability is due to the bypass of XrayWrappers, allowing web content to open a privileged window with the chrome property. An attacker could exploit this vulnerability by enticing a user to open a specially crafted webpage, resulting in execution of arbitrary code.
Strike WordPress Marketplace Remote Code Execution	CWE: 20 CVE: 2014-9013 BID: 73328 EXPLOITDB : 36490	This strike exploits a RCE vulnerability existent in the WordPress Marketplace plugin. This vulnerability is due to the lack of proper input sanitization while processing data from a POST request. An unauthenticated user could exploit this vulnerability by specially crafting a HTTP POST request with a call to wpmp_pp_ajax_call() method, which can lead to arbitrary code execution in the context of the vulnerable WP plugin.
Strike Schneider Electric ProClima ArrangeObjects Memory Corruption	CWE: 119 CVE: 2014-9188 BID: 71713	This strike exploits a memory corruption vulnerability in Schneider Electric ProClima MetaDraw ActiveX. The vulnerability is due to insufficient validation of a parameter from the ArrangeObjects method. By enticing a user to access a malicious web page, an attacker could execute code remotely in the context of the affected user.
Strike Advantech WebAccess AspVCOBJ ActiveX Multiple Buffer Overflow Vulnerabilities	CWE: 119 CVE: 2014-9208 BID: 76672	This strike exploits a vulnerability in Advantech WebAccess. The vulnerability is due to improper input validation of the argument given to InterfaceFilter, GetLastTagNbr, UpdateProjec or GetRecipeInfo methods in the AspVCOBJ ActiveX control. An attacker could exploit this vulnerability in order to remotely execute malicious code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SAP SQL Anywhere .NET Data Provider Scientific Notated Number Buffer Overflow	CWE: 119 CVE: 2014-9264 BID: 71627	This strike exploits a buffer overflow vulnerability in SAP SQL Anywhere .NET Data Provider. The vulnerable program fails to properly validate integers with multiple "e" or "E" scientific notation characters, and will copy the value into a fixed-length buffer. Successful exploitation may result in execution of arbitrary code with privileges of the .NET application or abnormal termination of the vulnerable application.
Strike Samsung SmartViewer CNC_Ctrl ActiveX Control Buffer Overflow	CWE: 119 CVE: 2014-9265 BID: 71486	This strike exploits a stack buffer overflow vulnerability in Samsung SmartViewer CNC_Ctrl ActiveX. The flaw is due to insufficient validation of input to the BackupToAvi method by the CNC_Ctrl ActiveX control. By enticing a user to visit a malicious web page, arbitrary code can be executed on the client system.
Strike Microsoft Internet Explorer CAutoRange ScrollIntoView Memory Corruption	CWE: 399 CVE: 2015-0017 BID: 72402	This strike exploits a Memory Corruption vulnerability in Internet Explorer. The vulnerability is due to the manner in which Internet Explorer processes selections and scrolling. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike Microsoft Internet Explorer CShadow Direction Integer Overflow	CWE: 399 CVE: 2015-0036 BID: 72446	This strike exploits an Integer Overflow vulnerability in Internet Explorer. The vulnerability is due to the failure of the CShadow::put_Direction function to sanitize user-supplied input. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike Microsoft Internet Explorer X509EnrollmentWeb ClassFactory Type Confusion Memory Corruption	CWE: 399 CVE: 2015-0046 BID: 72416	This strike exploits a Memory Corruption Vulnerability in the Microsoft Internet Explorer X509EnrollmentWebClassFactory ActiveX Control. An attacker can entice a victim to visit a specially crafted web page using the vulnerable control. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer DOM Style Postion Memory Corruption	CWE: 399 CVE: 2015-0053 BID: 72421	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. An HTML DOM object with specially crafted style values can be used to trigger memory corruption. Successful exploitation may result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer BuildAnimation Memory Corruption	CWE: 399 CVE: 2015-0099 BID: 72925	This strike exploits a Memory Corruption vulnerability in Internet Explorer. The vulnerability occurs when certain CSS directives are used during key frame creation. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer CTreeNode Use-After-Free	CWE: 119 CVE: 2015-0100 BID: 72926	This strike exploits a Use-After-Free vulnerability in Internet Explorer. The vulnerability is due to an error while handling CTreeNode objects. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike PHP Core Unserialize Numeric KeyName Use After Free	CVE: 2015-0231 BID: 72539	This strike exploits a use after free vulnerability in PHP. When PHP attempts to deserialize a specially crafted serializable object, a use after free may occur. Successful exploitation may result in arbitrary code executions with the privileges of the PHP application or abnormal program termination.
Strike GNU C Library (glibc) gethostname Function Heap Buffer Overflow - Wordpress XML-RPC	CWE: 119 CVE: 2015-0235 BID: 72325	This strike exploits a heap buffer overflow within glibc, used by Wordpress XML-RPC. The vulnerability is due to a failure to validate user input within the gethostbyname function. A remote, unauthenticated attacker could exploit this vulnerability by sending a specially crafted XML-RPC request, resulting in arbitrary code execution on the targeted system.
Strike PHP DateTime Object Unserialize Use After Free	CVE: 2015-0273 BID: 72701 EXPLOITDB : 36158	This strike exploits a vulnerability PHP which is triggered when trying to unserialize a serialized DateTime object. The vulnerability can be exploited through user supplied parameters which are then passed to the vulnerable function. If exploited the vulnerability can result in remote code execution under the context of the service running the PHP server.
Strike Oracle Data Quality LoaderWizard ActiveX SetEntities Type Confusion	CVE: 2015-0444 BID: 75803	This strike exploits a type confusion vulnerability in Oracle Data Quality. The ActiveX control TSS12.LoaderWizard.lwctrl has a function SetEntities, which expects a VARIANT type parameter. If the function receives an unexpected type, it leads to an arbitrary pointer dereference. Successful exploitation may result in execution of arbitrary code or abnormal browser termination.
Strike Cisco Data Center Network Manager FileServlet Class Information Disclosure	CWE: 22 CVE: 2015-0666 BID: 73479	This strike exploits a Cisco Data Center Network Manager directory traversal vulnerability which is due to improper parameter validation in the FileServlet class doGet method. By exploiting this vulnerability sensitive information could be obtained, which could be used in a remote code execution attack.
Strike Novell Zenworks Configuration Management remote code execution	CWE: 22 CVE: 2015-0779 BID: 73949	This strike exploits a directory traversal vulnerability in Novell ZenWorks Configuration Management. The vulnerability is due to improper handling of the uid parameter in UploadServlet. By exploiting this vulnerability, an unauthenticated attacker can upload files in arbitrary locations on the server and execute them. NOTE: By default the vulnerable services are accessed via SSL connection (port 443)

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Novell Zenworks Configuration Management GetStoredResult SQL Injection	BID: 74284 CWE: 89 CVE: 2015-0780	This strike exploits a SQL injection vulnerability in Novell Zenworks Configuration Management. The vulnerability is due to improper validation of user supplied input in the GetStoredResult action. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary SQL queries on the server.
Strike Novell Zenworks Configuration Management Rtrlet Directory Traversal	CWE: 22 CVE: 2015-0781 BID: 74291	This strike exploits a directory traversal vulnerability in Novell Zenworks Configuration Management. The vulnerability is due to improper validation of user supplied data in the Rtrlet class when uploading files to the server. By exploiting this vulnerability, an unauthenticated attacker can upload files to arbitrary locations on the server and execute them.
Strike Novell Zenworks Configuration Management scheduleQuery SQL Injection	CWE: 89 CVE: 2015-0782 BID: 72808	This strike exploits an SQL injection vulnerability in Novell Zenworks Configuration Management. The vulnerability is due to improper sanitization of user supplied input in the scheduleQuery action. An authenticated attacker can exploit this vulnerability in order to execute arbitrary SQL queries on the target system. NOTE: By default the vulnerable services are accessed via SSL connection (port 443).
Strike Novell ZENworks Configuration Management Directory Traversal	CWE: 200 CVE: 2015-0785 BID: 74288	This strike exploits a directory traversal vulnerability inside Novell ZENworks Configuration Management. The vulnerability is due to improper parameter validation in the DirectoryViewer run method. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services. NOTE: By default the vulnerable services are accessed via SSL connection (port 443).
Strike NetIQ Solutions Safeshellexecute buffer overflow	CWE: 119 CVE: 2015-0795 BID: 75903	This strike exploits a buffer overflow vulnerability in NETIQExecObject.NetIQExec ActiveX Control. The vulnerability is due to improper validation of parameters in the SafeShellExecute method. By enticing a user to access a specially crafted web page, an attacker can execute arbitrary code on the target's system.
Strike Sefrengo CMS idclient and idcat SQL Injection	CWE: 89 CVE: 2015-0919 BID: 71885	This strike exploits a SQL injection in Sefrengo CMS. The vulnerability is due to improper sanitization of user supplied input in idcat and idclient parameters in /backend/main.php. By exploiting this vulnerability, an authenticated attacker can execute arbitrary SQL queries on the server.
Strike Schneider Electric DS-NVs RVControl Buffer Overflow	CWE: 119 CVE: 2015-0982 BID: 73096	This strike exploits a Schneider Electric Pelco DS-NV Software package vulnerability which is due to improper bound validation in the SetText method. An attacker could exploit this vulnerability in order to remotely execute malicious code.

Name	References	Description
Strike D-Link DnsProxy Cross Site Scripting (XSS)	CWE: 79 CVE: 2015-1028 EXPLOITDB : 35750 BID: 72725	This strike exploits a stored cross-site scripting (XSS) vulnerability in D-Link DSL-2730B Modem. The vulnerability is due to improper validation of HTTP request domainname parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike Safari Cross-Domain Vulnerability	CWE: 20 CVE: 2015-1126 BID: 73977	This strike exploits a Safari cross-domain vulnerability which is due to improper FTP URL sanitization. By exploiting this vulnerability an attacker could gain unauthorized access to information or services.
Strike Privilege Escalation Vulnerability Inside Apple CUPS	CWE: 254 CVE: 2015-1158 BID: 75098	This strike exploits an elevation-of-privilege vulnerability inside Apple CUPS. The vulnerability is due to improper processing of certain requests in the add_job method. An attacker could exploit this vulnerability in order to gain root privileges and execute malicious code on the target machine.
Strike Cross-Site Scripting (XSS) Vulnerability Inside Apple CUPS Web Interface	CWE: 79 CVE: 2015-1159 BID: 75106	This strike exploits a cross-site scripting vulnerability inside Apple CUPS Web interface. The vulnerability is due to improper input validation in the cgi_puts method. By exploiting this vulnerability an attacker could execute malicious scripts on the target machine.
Strike ElasticSearch Search Groovy Sandbox Bypass Vulnerability	CWE: 284 CVE: 2015-1427 BID: 72585	This strike exploits a sandbox-bypass vulnerability in ElasticSearch. The vulnerability is due to a failure to sanitize user supplied input, java code to be executed via reflection. Exploiting this vulnerability could allow remote, unauthenticated attackers to execute arbitrary code on the target server.
Strike Sefrengo CMS Login Cookie SQL Injection	CWE: 89 CVE: 2015-1428 BID: 72452	This strike exploits a SQL injection vulnerability in Sefrengo CMS. The vulnerability is due to improper sanitization of the cookie in HTTP requests. The vulnerable file is /backend/main.php. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary SQL queries on the server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Sefrengo CMS value_id SQL Injection	CWE: 89 CVE: 2015-1428 BID: 72452	This strike exploits a SQL injection in Sefrengo CMS. The vulnerability is due to improper sanitization of user supplied input in /backend/main.php. The vulnerable parameter is value_id. By exploiting this vulnerability, an authenticated attacker can execute arbitrary SQL queries on the server.
Strike ManageEngine ServiceDesk Plus Privilege Bypass Information Disclosure	CWE: 200 CVE: 2015-1480 BID: 72302	This strike exploits a directory traversal vulnerability in ServiceDesk. A non-administrator user can access certain directories which should be restricted to administrators due to insufficient validation. Successful exploitation can result in disclosure of information.
Strike Symantec Endpoint Protection ConsoleServlet Policy Bypass Vulnerability	CWE: 287 CVE: 2015-1486 BID: 76074	This strike exploits a policy bypass vulnerability in Symantec Endpoint Protection. The vulnerability is due to improperly sending a valid session token to unauthenticated users that request a password reset for the admin account. An attacker could exploit this vulnerability in order get access on the target machine. NOTE: By default the vulnerable services are accessed via SSL connection (port 8443).
Strike Multiple Vulnerabilities in Samsung Security Manager ActiveMQ	CWE: 264 CVE: 2015-1499 BID: 72598	This strike exploits multiple code execution vulnerabilities inside Samsung Security Manager ActiveMQ. These vulnerabilities are due to permitting unauthenticated access to ActiveMQ Fileserver. An attacker could exploit this vulnerability in order to gain unauthorized access and run malicious code on the target machine.
Strike SolarWinds Server and Application Monitor loadExtensionFactor y Stack Buffer Overflow	CWE: 119 CVE: 2015-1500 BID: 72600	This strike exploits a buffer overflow vulnerability in SolarWinds Orion Server and Application Monitor that is due to lack of boundary validation. Exploitation of this vulnerability results in a remote code execution attack.
Strike IceWarp Mail Server under 11.1.1 - Directory Traversal	CWE: 22 CVE: 2015-1503 EXPLOITDB : 44587	This vulnerability in IceWarp Mail Server under version 11.1.1 allows attackers read access to arbitrary file content by directory traversal due to insufficient validation of http parameter "script".
Strike Dell ScriptLogic Asset Manager GetClientPackage SQL Injection	CWE: 89 CVE: 2015-1605 BID: 72697	This strike exploits a SQL injection vulnerability in Dell ScriptLogic Asset Manager. The vulnerability is due to improper sanitization of parameters in HTTP requests. By exploiting this vulnerability, an unauthenticated attacker can inject and execute SQL queries, leading to disclosure or manipulation of data on the server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer CGeneratedContent Memory Corruption	BID: 72927 CWE: 399 CVE: 2015-1622	This strike exploits a Microsoft Internet Explorer vulnerability which is due to an out-of-bounds write while style processing HTML elements. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Microsoft HTTP.sys Remote Code Execution Vulnerability	CWE: 94 CVE: 2015-1635 BID: 74013	This strike exploits an integer overflow vulnerability in Microsoft HTTP.sys. The vulnerability is caused by an integer overflow which may occur when processing specially crafted HTTP requests. Successful exploitation could lead to remote code execution under the System account or to a denial of service.
Strike Internet Explorer Tree TextData Use After Free	CWE: 399 CVE: 2015-1665 BID: 74000	This strike exploits a use after free vulnerability in Microsoft Internet Explorer. The vulnerability is caused by incorrect management of TextData objects when processing HTML and Javascript code. A remote unauthenticated attacker could exploit this vulnerability by enticing a user to view a specially crafted HTML file, possibly resulting in remote code execution in the security context of the target user.
Strike Internet Explorer CVE-2015-1667 Use After Free	CWE: 399 CVE: 2015-1667 BID: 74003	This strike exploits a use after free vulnerability in Microsoft Internet Explorer. The vulnerability is caused by incorrect management of CQuotes objects when processing HTML and Javascript code. A remote unauthenticated attacker could exploit this vulnerability by enticing a user to view a specially crafted HTML file, possibly resulting in remote code execution in the security context of the target user.
Strike Microsoft Internet Explorer SVG Marker Object Use-After-Free	CWE: 399 CVE: 2015-1668 BID: 74004	This strike exploits a Use-After-Free vulnerability in Internet Explorer. The vulnerability is due to an error while handling CGeneratedTreeNode objects. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike Information Disclosure Vulnerability in Microsoft Windows VBScript	CWE: 200 CVE: 2015-1684 BID: 74522	This strike exploits a regular expression information disclosure vulnerability inside Microsoft Windows VBScript . This vulnerability is due to improper processing of regular expressions. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Information Disclosure Vulnerability in Microsoft Internet Explorer	CWE: 200 CVE: 2015-1692 BID: 74517	This strike exploits an information disclosure vulnerability inside Microsoft Internet Explorer. The vulnerability is due to improper access to system clipboard through copy, cut and paste events. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer CParamElement Use-After-Free	CWE: 119 CVE: 2015-1705 BID: 74509	This strike exploits a Use-After-Free vulnerability in Internet Explorer. The vulnerability is due to an error while handling CParamElement objects. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike Internet Explorer memory corruption	CWE: 399 CVE: 2015-1744 BID: 74984	This strike exploits a use after free vulnerability in Internet Explorer. The vulnerability is due to the way first-line and first-letter element styling are handled in HTML code. By enticing a user to access a specially crafted web page, a remote unauthenticated attacker can execute arbitrary code in the security context of the target user.
Strike Memory Corruption Vulnerability Inside Microsoft Internet Explorer	CWE: 399 CVE: 2015-1745 BID: 74985	This strike exploits a memory corruption vulnerability inside Microsoft Internet Explorer . The vulnerability is due to an error that occurs when CAttrValue objects are created with uninitialized data. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Microsoft Internet Explorer ArrayBuffer Write What Where	CWE: 399 CVE: 2015-1747 BID: 74986	This strike exploits a write-what-where condition in Microsoft Internet Explorer version 11. The vulnerability is caused by improper invalidation of an ArrayBuffer object. A remote, unauthenticated attacker could exploit this vulnerability by enticing a user to access a crafted HTML page. Successful exploitation would result in code execution in the context of the user accessing the web page.
Strike Microsoft Internet Explorer execCommand AutoDetect Crafted Url Memory Corruption	CWE: 399 CVE: 2015-1752 BID: 74989	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. An HTML DOM execCommand AutoDetect can be caused to read out-of-bounds by a specially crafted URL string. An attacker can entice a target to visit a specially crafted webpage to trigger the exploit. Successful exploitation can result in execution of arbitrary code, information disclosure, or abnormal termination of Internet Explorer.
Strike Apache ActiveMQ File Upload Directory Traversal Vulnerability	CWE: 22 CVE: 2015-1830 BID: 76452	This strike exploits a directory traversal vulnerability in Apache ActiveMQ. The vulnerability is due to improper validation of destination HTTP header. Using a crafted URI, an attacker could upload a malicious executable to be executed on the target server.

Name	References	Description
Strike D-Link HNAP SOAPAction Header Command Execution	CWE: 77 CVE: 2015-2051 BID: 74870 EXPLOITDB : 37171	This strike exploits a vulnerability in D-Link DIR-645 Wired/Wireless Router. Specially crafted HTTP messages can be sent to a vulnerable device to achieve arbitrary code execution via HNAP interface.
Strike Agilent Technologies Feature Extraction Insert Method Out-Of-Bounds Indexing	CWE: 119 CVE: 2015-2092 BID: 72840	This strike exploits an out-of-bounds indexing vulnerability in Agilent Technologies Feature Extraction. The vulnerability is caused by improper validation of a parameter to the Insert method. A remote, unauthenticated attacker could exploit this vulnerability by crafting a malicious page and enticing a user to access it. Successful exploitation could lead to code execution in the security context of the application.
Strike WebGate WESPPPlayback Stack Buffer Overflow	CWE: 119 CVE: 2015-2094 BID: 72841	This strike exploits a WebGate WESPPPlaybackCtrl control vulnerability that appears in multiple products. This vulnerability is due to improper bound validation in the PlaySiteAllChannel, StopSiteAllChannel, PrintSiteImage and SaveSiteImage methods. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike WebGate Multiple Products WESPMonitor Stack Buffer Overflow	CWE: 119 CVE: 2015-2097 BID: 72835	This strike exploits a stack buffer overflow vulnerability in multiple WebGate products in the WESPMonitorCtrl ActiveX control. The vulnerability is due to improper validation of a parameter in LoadImage and LoadImageEx methods. By enticing a user to access a specially crafted web page, an attacker could execute arbitrary code.
Strike WebGate eDVR Manager WESPPPlayback SiteName Stack Buffer Overflow	CVE: 2015-2098 BID: 72838	This strike exploits a WebGate eDVR Manager WESPPPlaybackCtrl ActiveX buffer overflow vulnerability. This vulnerability is due to improper bound validation for the SiteName property. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike WebGate WESPSDK WESPDiscovery Stack Buffer Overflow	CVE: 2015-2100 BID: 72843	This strike exploits a buffer overflow vulnerability in WebGate WESPSDK WESPDiscovery ActiveX. The vulnerability is due to improper validation of a parameter in TCPDiscovery and TCPDiscovery2 methods. By enticing a user to access a specially crafted web page, an attacker could execute arbitrary code.
Strike HP SiteScope Log Analyzer Information Disclosure	CVE: 2015-2120 BID: 74801	This strike exploits an information disclosure vulnerability in HP SiteScope LogAnalyzer versions 11.1x before 11.13, 11.2x before 11.24.391, and 11.3x before 11.30.521. The vulnerability is caused by improper validation of a user-supplied file path, allowing a user to, among others, load user passwords from the users.config file. An authenticated attacker could exploit this by choosing a filename which would then disclose user passwords, possibly leading to privilege escalation to the administrator role.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike PHPMoAdmin Unauthorized Remote Code Execution	CWE: 77 CVE: 2015-2208	This strike exploits an arbitrary code execution vulnerability in phpMoAdmin. The vulnerability is due to unsanitized evaluation of user-supplied input via http. An attacker could exploit this vulnerability to remotely execute arbitrary code on the target system.
Strike SolarWinds Firewall Security Manager userlogin.jsp Policy Bypass	CWE: 264 CVE: 2015-2284	This strike exploits a policy bypass vulnerability in SolarWindws Firewall Security Manager. The vulnerability is due to improper handling of parameters in userlogin.jsp. By exploiting this vulnerability, an attacker can add, modify, remove or impersonate users without authentication.
Strike Electric Sheep Fencing pfSense Directory Traversal	CWE: 352 CVE: 2015-2295 BID: 73344	This strike exploits an Electric Sheep Fencing pfSense directory traversal vulnerability which is due to improper parameter validation. By exploiting this vulnerability an attacker could delete private information which could lead to a denial of service attack.
Strike Microsoft Internet Explorer Memory Corruption Vulnerability	CWE: 119 CVE: 2015-2391	This strike exploits a memory corruption vulnerability inside Microsoft Internet Explorer. The vulnerability is due to an error that occurs when trying to free an internal structure 2 times. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Internet Explorer Javascriptexecption sOperator memory corruption	CWE: 119 CVE: 2015-2443 BID: 76195	This strike exploits a type confusion vulnerability in Microsoft Internet Explorer. The vulnerability is due to improper handling of a parameter in the accessor function for the stack trace property descriptor. An attacker can entice a target to visit an specially crafted HTML page in order to trigger the vulnerability. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer.
Strike Microsoft Internet Explorer CSS Style Behavior Property Use After Free	CWE: 119 CVE: 2015-2444 BID: 76194	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically the vulnerability exists when a CSS style assigned to a child element of an HTML element is overwritten through reloading the window. If the object is deleted a reference to it remains and any further attempts to access the freed object result in a use-after-free condition.
Strike CInput Memory Corruption Vulnerability In Microsoft Internet Explorer	CWE: 119 CVE: 2015-2446 BID: 76193	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. The vulnerability is due to a user-after-free condition that can be triggered when dealing with CInput objects. An attacker could exploit this vulnerability in order to remotely execute malicious code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Type Confusion Vulnerability In Microsoft Internet Explorer	CWE: 119 CVE: 2015-2448 BID: 76191	This strike exploits a type confusion vulnerability in Microsoft Internet Explorer. The vulnerability is due to an error that occurs when handling an Array's call function, which does not verify that the first parameter is an object. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Microsoft Internet Explorer WMPlayer Use-After-Free	CWE: 119 CVE: 2015-2487 BID: 76574	This strike exploits a Use-After-Free vulnerability in Internet Explorer. The vulnerability occurs when Internet Explorer interacts with Windows Media Player in the handling certain HTML objects. An attacker could exploit this vulnerability by enticing a user to view a malicious web page, executing arbitrary code on the victim machine.
Strike Microsoft Internet Explorer Memory Corruption Vulnerability Through Table Element	BID: 76580 CWE: 119 CVE: 2015-2499	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. The vulnerability is due to a out-of-bounds memory access condition that can be triggered when dealing with table elements constructed in a certain way. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Microsoft Windows Shell Toolbar Object Use After Free	CWE: 416 CVE: 2015-2515 BID: 76981	This strike exploits a use after free vulnerability in Microsoft Windows Shell. The vulnerability is triggered by accessing a CQuickLinksobject after its deletion. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Microsoft Windows Tablet Input Band Object Use After Free	CVE: 2015-2548 BID: 76989	This strike exploits a use after free vulnerability in Microsoft Tablet Input Band. The vulnerability is triggered by accessing a CDeskBand object after its deletion. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike ManageEngine Desktop Central Unauthorized Administrative Password Reset	BID: 73380 CWE: 264 CVE: 2015-2560	This strike exploits an access control vulnerability in ManageEngine Desktop Central. The vulnerability is due to lack of authentication checks on DCOperationsServlet. By exploiting this vulnerability, an unauthenticated attacker can modify password for privileged accounts and gain administrative access in the application.
Strike Oracle Endeca Information Discovery Integrator ETL Server Directory Traversal Vulnerability Through CopyFile	CVE: 2015-2604 BID: 75757	This strike exploits a directory traversal vulnerability in Oracle Endeca Information Discovery Integrator ETL Server. The vulnerability is due to improper validation of parameters when handling CopyFile operation in SOAP requests. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Endeca Information Discovery Integrator ETL Server Directory Traversal Vulnerability Through MoveFile	CVE: 2015-2605 BID: 75756	This strike exploits a directory traversal vulnerability in Oracle Endeca Information Discovery Integrator ETL Server. The vulnerability is due to improper validation of parameters when handling MoveFile operation in SOAP requests. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Oracle Endeca Information Discovery CloverServerWSImpl directory traversal	CVE: 2015-2606 BID: 75758	This strike exploits a directory traversal vulnerability in Oracle Endeca Information Discovery Integrator ETL Server. The vulnerability is due to insufficient validation of user supplied input in RenameFile SOAP requests. By exploiting this vulnerability, an authenticated attacker can move arbitrary files on the vulnerable server in order to disclose sensitive information.
Strike Wordpress Simple Ads Manager SQL Injection	CWE: 89 CVE: 2015-2824 BID: 73698	This strike exploits a SQL injection vulnerability in WordPress Simple Ads Manager. The vulnerability is due to failure to sanitize user-controlled input in sam-ajax.php and sam-ajax-admin.php. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary SQL queries on the server.
Strike Wordpress Simple Ads Manager Arbitrary File Upload	CVE: 2015-2825 BID: 73924	This strike exploits a directory traversal vulnerability in Wordpress Simple Ads Manager. The vulnerability is due to lack of sanitization of the path parameter in sam-ajax-admin.php. By exploiting this vulnerability, an unauthenticated attacker can upload arbitrary files on the server and execute them.
Strike Wordpress Simple Ads Manager Information Disclosure	CWE: 200 CVE: 2015-2826 BID: 73924	This strike exploits an information disclosure vulnerability in Wordpress Simple Ads Manager. The vulnerability is due to improper handling of the action parameter in sam-ajax-admin.php. The vulnerability can be exploited through sam-ajax-admin.php and allows remote unauthenticated information disclosure from the database available in the application.
Strike TP-Link Archer Devices Directory Traversal	CWE: 22 CVE: 2015-3035	This strike exploits a directory traversal vulnerability in TP-Link Archer Devices. This vulnerability is due to insufficient input validation. A remote, unauthenticated attacker could exploit this vulnerability to read sensitive information from arbitrary files located on the file system of the target server.
Strike cURL and libcurl sanitize_cookie_path remote code execution	CWE: 119 CVE: 2015-3145 BID: 74303	This strike exploits a remote code execution vulnerability in cURL and libcurl. The vulnerability is due to improper validation of the Set-Cookie header. An unauthenticated attacker can exploit this vulnerability in order to execute arbitrary code on the target system. Unsuccessful exploitation may lead to a denial of service condition on the target system.

Name	References	Description
Strike WordPress Comment Cross Site Scripting (XSS)	CWE: 79 CVE: 2015-3440 BID: 74334	This strike exploits a cross-site scripting vulnerability in Wordpress. The vulnerability is due to improper validation of HTTP request comment parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike Magento Forwarded Authentication Bypass	CWE: 287 CVE: 2015-3457 BID: 74420	This strike exploits an authentication bypass vulnerability in Magento. The vulnerability is due to improper handling of unauthenticated requested actions with the forwarded parameter set. By exploiting this vulnerability, an unauthenticated attacker can perform administrative actions without any prior authentication.
Strike Bonita BPM themeResource directory traversal arbitrary file disclosure	CWE: 22 CVE: 2015-3897	This strike exploits a directory traversal vulnerability in Bonita BPM. The vulnerability is due to lack of validation of user supplied parameters in themeResource web page An unauthenticated attacker can exploit this vulnerability in order to reveal the contents of files from any location on the vulnerable server.
Strike PHP tar Zero Length File Name Integer Overflow	CWE: 189 CVE: 2015-4021 BID: 74700	This strike exploits an integer overflow vulnerability in PHP. When PHP processes a tar file, it determines the length of the filename by the displacement of the first null byte. A later calculation subtracts 1 from this length. If the calculated length was zero, the calculation results in an unsigned integer overflow, allowing access to a large portion of the heap. Successful exploitation may result in execution of arbitrary code with privileges of the service running PHP or abnormal termination of the service.
Strike Visual Mining NetCharts Server saveFile.jsp Directory Traversal	CWE: 22 CVE: 2015-4031 BID: 74792	This strike exploits a directory traversal vulnerability in Visual Mining NetCharts Server versions 7.0.1 and prior. The vulnerability is caused by improper sanitization of the filename parameter in a request to saveFile.jsp. An unauthenticated remote attacker could exploit this vulnerability by sending a crafted HTTP request to the target application, leading to file upload and remote code execution under the credentials of the process running the web server (by default, System).
Strike Visual Mining Netcharts Server projectContents.jsp directory traversal	CWE: 264 CVE: 2015-4032 BID: 74788	This strike exploits a directory traversal vulnerability in Visual Mining NetCharts Server. The vulnerability is due to improper validation of the project parameter in projectContents.jsp when renaming project files. By exploiting this vulnerability, an unauthenticated attacker can rename arbitrary files on the server, which can result in a denial of service condition.

Name	References	Description
Strike Adobe Flash Nellymoser audio Codec Heap Overflow	CWE: 119 CVE: 2015-4432 GOOGLE: 425 BID: 75592	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow when loading FLV file with Nellymoser audio codec. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike OpenEMR Authentication Bypass Vulnerability	CWE: 287 CVE: 2015-4453 BID: 75299	This strike exploits an authentication bypass vulnerability in OpenEMR. The vulnerability is due to improper HTTP parameter extraction. An attacker could exploit this vulnerability in order to obtain unauthorized access.
Strike Mozilla Firefox Pdf.js Same Origin Policy Bypass	CVE: 2015-4495 CWE: 346	This strike exploits the Same-Origin Policy Bypass Vulnerability against Mozilla Firefox. The Vulnerability is due to a design flaw in the built-in PDF Viewer of the application. A remote unauthenticated attacker can exploit this vulnerability by enticing a user to visit a specially crafted webpage. Successful Exploitation would result in the disclosure of sensitive information.
Strike Panasonic Security Ipropsapi ActiveX FilePassword Buffer Overflow	BID: 75409 CWE: 119 CVE: 2015-4647	This strike exploits a buffer overflow vulnerability in Panasonic Security API Ipropsapi ActiveX Control. The vulnerability is due to improper validation of the FilePassword property. By enticing a user to access a specially crafted web page, an attacker can execute arbitrary code.
Strike Panasonic Security Ipropsapi ActiveX MulticastAddr Buffer Overflow	CWE: 20 CVE: 2015-4648 BID: 75405	This strike exploits a buffer overflow vulnerability in Panasonic Security API Ipropsapi ActiveX Control. The vulnerability is due to improper validation of the MulticastAddr property. By enticing a user to access a specially crafted web page, an attacker can execute arbitrary code.
Strike Oracle Data Quality SetBasicPreviewData type confusion	CVE: 2015-4759 BID: 75806	This strike exploits a code execution vulnerability in Oracle Data Quality TSS12.LoaderWizard.Iwctrl ActiveX. The vulnerability is due to improper handling of native Javascript objects by the SetBasicPreviewData method. An unauthenticated attacker can exploit this vulnerability by enticing a user to view a specially crafted web page. Successful exploitation can lead to remote code execution.

Name	References	Description
Strike Endian Firewall Proxy Reset Pasword Command Execution	CWE: 77 CVE: 2015-5082 EXPLOITDB : 38096 BID: 76865	This strike exploits a input validation error present in Endian Firewall. Vulnerability can be exploited by crafting a special HTTP request to the target. Successful exploitation would result in arbitrary command execution in the security context of Apache httpd server.
Strike Adobe Flash ActionScript 3 ByteArray Use After Free	CWE: 119 CVE: 2015-5119 BID: 75568	This strike exploits a use after free vulnerability in Adobe Flash. If a ByteArray object contains a class instance which resizes the ByteArray, new memory will be allocated for the ByteArray, but a Vector object may be written in the address of the old ByteArray, a use after free condition. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike Apache Software Foundation Subversion Integer Overflow Vulnerability	CWE: 119 CVE: 2015-5343	This strike exploits an integer overflow vulnerability in Apache Software Foundation Subversion. The vulnerability is due to improper validation of HTTP Content-Length header before allocating a heap buffer based on this length. An attacker could exploit this vulnerability in order to remotely execute arbitrary code or cause a denial of service condition on the target machine.
Strike Adobe Flash MP3 ID3 Integer Overflow	CWE: 189 CVE: 2015-5560 BID: 76289 EXPLOITDB : 37882	This strike exploits an integer overflow vulnerability in Adobe Flash Player. The vulnerability is due to a failure when handling malformed MP3 files. An attacker could exploit this vulnerability by enticing a user to open a malicious file with the vulnerable software, potentially executing arbitrary code.
Strike Adobe Flash Player Wild write in Color Conversion Memory Corruption	CWE: 119 CVE: 2015-5575 GOOGLE: 452 BID: 76799	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a wild write at 0x453b0cf0 in color conversion. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe Flash Audio Handling Read Out Of Bound	CWE: 119 CVE: 2015-5577 BID: 76799 GOOGLE: 449	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to an out-of-bounds read when Adobe flash loads the MP4 file using Sound.extract() or a similar API. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike OpenDocMan Cross-Site Scripting (XSS)	CWE: 79 CVE: 2015-5625 BID: 76627	This strike exploits a cross-site scripting vulnerability in OpenDocMan Web interface. The vulnerability is due to improper validation of HTTP request parameters. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike WordPress KSES Bypass Cross Site Scripting (XSS)	CWE: 79 CVE: 2015-5714 BID: 76745	This strike exploits a cross-site scripting vulnerability in Wordpress. The vulnerability is due to improper validation of content in blog when using short code. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike Websense Content Gateway HTTP Parameter cmd_param Buffer Overflow	CWE: 119 CVE: 2015-5718 BID: 75160	This strike exploits a buffer overflow vulnerability inside Websense Content Manager administrative interface. The vulnerability is due to improper validation of cmd_param HTTP parameter. An attacker could exploit this vulnerability in order to remotely execute malicious code on the target machine.
Strike Typo3 CMS Cross Site Scripting (XSS)	CWE: 79 CVE: 2015-5956 BID: 76692	This strike exploits a cross-site scripting vulnerability in Typo3 CMS. The vulnerability is due to improper validation of HTTP request returnUrl and redirect_url HTTP parameters. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike Microsoft Internet Explorer CWindow Object Use After Free	CVE: 2015-6042 BID: 76984	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically a use after free vulnerability occurs when an iframe element is encountered pointing to code in which a CWindow object is created. If the children of this object are deleted upon invoking an event listener, memory corruption can occur leading a use after free condition. It is possible that an attacker can control this, potentially leading to remote code execution, or a denial of service in the Internet Explorer application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer COM object Use After Free	CWE: 119 CVE: 2015-6049 BID: 76986	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically the vulnerability is found in iframe.dll, and is due to the deletion of a CISFBand object. When the page is reloaded and an attempt to access that deleted object is made, a use-after-free condition occurs, which can lead to memory corruption.
Strike Microsoft Internet Explorer ArrayBuffer Information Disclosure	CWE: 200 CVE: 2015-6053 BID: 76995	This strike exploits an information disclosure vulnerability in Microsoft Internet Explorer. The vulnerability is due to the way the ArrayBuffer.slice method handles transfer of information between different browser windows. An attacker could exploit this vulnerability in order to access private information.
Strike Microsoft Internet Explorer Onresize Use After Free	CWE: 119 CVE: 2015-6071	This strike identifies a user after free vulnerability in Internet Explorer. Specifically, if a form element contains an input element and the value of that input element is changed an onresize event of the form id1ect is triggered. Next the form id1ect's event handler tries to reference an element that does not exist causing memory corruption to occur.
Strike Microsoft Internet Explorer CTableRow Object Memory Corruption	CWE: 119 CVE: 2015-6083 BID: 78481	This strike identifies a vulnerability in Microsoft Internet Explorer. This vulnerability is due to the way Internet Explorer handles certain table element objects. Specifically when a CTableRow object is allocated and insertRow is called on that object with an uninitialized pointer as a parameter that belongs to the allocated object memory corruption can occur.
Strike Microsoft Internet Explorer DOM SVG TextBox Object Type Confusion Memory Corruption	CWE: 119 CVE: 2015-6085 BID: 77456	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. A specially crafted webpage with certain manipulations of DOM SVG TextBox objects with nested HTML tags can trigger a type confusion condition. An attacker can entice a target to visit such a webpage in order to exploit the target machine. Successful exploitation can result in execution of arbitrary code or abnormal termination of Internet Explorer on the target machine.
Strike Microsoft Internet Explorer VBScript Engine String Compare Use After Free	CWE: 119 CVE: 2015-6136 BID: 78538	This strike identifies a vulnerability in Microsoft Internet Explorer. Specifically, the vulnerability occurs with any VBScript function that utilizes a comparison or calculation of two strings. A use after free condition occurs if the function is called with an object as the first parameter, from a class with a default getter which frees the second parameter. If the second parameter is then referenced after being freed memory corruption can occur.
Strike Microsoft Internet Explorer and Edge Memory Corruption	CWE: 119 CVE: 2015-6140	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer and Edge. The vulnerability is due to error while handling certain objects when processing HTML and script code. A remote unauthenticated attacker could exploit these vulnerabilities by enticing the target user to open a specially crafted web page. Successful exploitation could lead to arbitrary code execution in the security context of the target user.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike GE MDS PulseNET Support Account Remote Code Execution Vulnerability	CVE: 2015-6456 BID: 76756	This strike exploits a remote code execution vulnerability in GE MDS PulseNET. The vulnerability is due to improper access granted to hidden support account. An attacker could exploit this vulnerability in order to remotely execute code on the target machine.
Strike GE MDS PulseNET FileDownloadServlet Directory Traversal Vulnerability	CWE: 22 CVE: 2015-6459 BID: 76756	This strike exploits a directory traversal vulnerability in GE MDS PulseNET products. The vulnerability is due to improper validation of parameters when handling requests to FileDownloadServlet. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Unitronics VisiLogic OPLC TeeCommander ActiveX Control Memory Corruption	CWE: 284 CVE: 2015-6478 BID: 77571	This strike identifies a vulnerability in the TeeComander activeX control TeeChart5.ocx. Specifically, a pointer dereference occurs on what is assumed to be a trusted ChartLink method. A different function uses the ChartLink pointer to reference memory in a calculation. If this memory is set to a location we can control, memory corruption can occur and remote code execution is possible.
Strike Ignite Realtime Openfire Cross-Site Scripting (XSS) Vulnerability	CWE: 79 CVE: 2015-6972 EXPLOITDB : 38191	This strike exploits a cross-site scripting (XSS) vulnerability in Ignite Realtime Openfire. The vulnerability is due to improper validation while processing HTTP requests with search parameter. An attacker could exploit this vulnerability in order to run malicious scripts on the target machine.
Strike Safari AppleScript User Assisted Remote Code Execution	CVE: 2015-7007 BID: 77266	This strike exploits a flaw in the Safari Browser on Macintosh Operating Systems (Mac OSX). When a browser is passed an applescript uniform resource locator (URL), it may fail to prompt a user for confirmation before executing script content.
Strike ManageEngine EventLog Analyzer runQuery SQL Injection Vulnerability	CWE: 89 CVE: 2015-7387 EXPLOITDB : 38352 BID: 76866	This strike exploits a sql injection vulnerability in ManageEngine EventLog Analyzer. The vulnerability is due to improper validation of HTTP requests to the runQuery servlet. An attacker could exploit this vulnerability by sending an unauthenticated malicious request to the server, compromising the integrity of the database.
Strike IBM WebSphere Application Server Remote Commons-Collections Code Execution Vulnerability	CWE: 94 CVE: 2015-7450 BID: 77653	This strike exploits a code execution vulnerability in IBM WebSphere Application Server. The vulnerability is due to improper validation of SOAP requests that contain certain serialized objects. An attacker could exploit this vulnerability in order to remotely execute arbitrary code on the target machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike ManageEngine OpManager SubmitQuery SQL Injection Vulnerability	CWE: 264  CVE: 2015-7766  EXPLOITDB : 38221  BID: 77047	This strike exploits a sql injection vulnerability in ManageEngine OpManager. The vulnerability is due to improper validation of HTTP requests to the opmapi servlet. An attacker could exploit this vulnerability by sending an unauthenticated malicious request to the server, compromising the integrity of the database.
Strike Unitronics VisiLogic OPLC IPWorksSSL ActiveX Control Memory Corruption	CWE: 94  CVE: 2015-7905  BID: 77571	This strike identifies a vulnerability in the Unitronics VisiLogic's activeX control IPWorksSSL.HTTPS. Specifically, a pointer dereference occurs on what is assumed to be a trusted SSLCertHandle method. If this memory is set to a location we can control, memory corruption will occur and remote code execution is possible.
Strike Schneider Electric ProClima up to 6.1 F1 Bookview buffer overflow	CWE: 119  CVE: 2015-7918  BID: 78421	This strike exploits a memory corruption vulnerability in Schneider Electric ProClima F1BookView ActiveX Control. Specifically the vulnerability in how the Rule and Text parameters are processed as iteration counters in a loop. The loop reads these 2 parameters and calculates their length. Then this data is read onto the stack and if x or y is larger than the amount of data between the current memory location and the end of the stack, a memory access violation occurs.
Strike SearchBlox Multiple Authentication Bypass Vulnerabilities	CWE: 264  CVE: 2015-7919  BID: 78552	This strike exploits multiple authentication bypass vulnerabilities in SearchBlox. The vulnerabilities are due to improper validation of HTTP requests. An attacker could exploit these vulnerabilities in order to add/delete a user, delete a collection, delete reports, import and export the configuration file. By importing and exporting the configuration file, the admin password could be compromised or overwritten and also a crash could be generated.
Strike Samsung SmartViewer STWAXConfigNVR ActiveX Control Remote Code Execution	BID: 77079  CVE: 2015-8039	This strike exploits an out of bounds indexing vulnerability in Samsung SmartViewer STWAXConfigNVR ActiveX control. The flaw is due to the STWAXConfigNVR ActiveX control, which contains an untrusted pointer dereference vulnerability. By enticing a user to visit a malicious web page, arbitrary code can be executed on the client system.
Strike ManageEngine Desktop Central fileupload connectionID Directory Traversal Arbitrary File Upload	CWE: 434  CVE: 2015-8249  EXPLOITDB : 38982	This strike exploits an arbitrary file upload vulnerability in ManageEngine Desktop Central. Files can be uploaded to the target by sending an HTTP POST request to /fileupload with a query parameter action=rds_file_upload. The connectionId parameter is not checked for directory traversal characters. An attacker can send a malicious HTTP POST request to upload an arbitrary file to an arbitrary location on the target system. Successful exploitation may lead to creation or overwriting of arbitrary files, which may lead to execution of arbitrary code with system privileges.

Name	References	Description
Strike Adobe Flash MP3 ID3 Tag Heap BUffer Overflow	BID: 78712 CWE: 119 CVE: 2015-8446	This strike exploits a heap buffer overflow vulnerability in Adobe Flash. The vulnerability is due to a failure when handling malformed MP3 files. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike IBM SPSS Statistics ActiveX Control Buffer Overflow	BID: 90524 CWE: 119 CVE: 2015-8530	This strike exploits buffer overflow vulnerability within the IBM SPSS Statistics ActiveX Control. This vulnerability is due to lack of boundary checking in the IBM SPSS Statistics ActiveX Control. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system.
Strike Schneider Electric ProClima F1BookView Code Execution	CWE: 119 CVE: 2015-8561 BID: 79802	This strike exploits a memory corruption vulnerability in Schneider Electric ProClima F1BookView ActiveX. The vulnerability is due to insufficient validation of a parameter from the CopyAll method. By enticing a user to access a malicious web page, an attacker could execute code remotely in the context of the affected user.
Strike Microsoft Internet Explorer VBScript and JScript Engine Use After Free	CWE: 119 CVE: 2016-0002 BID: 79894	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically the vulnerability exists when VBScript creates an array and resizes it, and then Javascript code creates an array and references the VBScript code. Later this code is freed, and when another call to the object is made with this freed array as a parameter, which then attempts to dereference a member of this array, it results in a use after free error.
Strike Microsoft Edge Chakra JavaScript Engine Integer Overflow	BID: 79891 CWE: 119 CVE: 2016-0024	This strike exploits an integer overflow vulnerability in Microsoft Edge's Chakra JavaScript engine. Specifically the vulnerability is due to improper bounds checking when creating a DataView object. If an overly large value is given as the byteLength variable, an integer overflow can occur when calculating the DataView range. This can potentially be leveraged by an attacker to disclose information or corrupt memory.
Strike Microsoft Silverlight Decoder Code Execution	CWE: 20 CVE: 2016-0034	This strike exploits a vulnerability in Microsoft Silverlight. The vulnerability is due to a buffer overflow while calling GetChars method. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the Silverlight application.
Strike Microsoft Internet Explorer CDomPrototype Object Memory Corruption	CWE: 119 CVE: 2016-0063 BID: 82658	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically a type confusion vulnerability exists when a DomPrototype object is allocated and assigned to a local variable. If the variable is changed to reference a different pointer later and then eventually called, an access violation occurs because it believes it is still an object of type CDomPrototype. When this happens memory corruption occurs which can lead to remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Edge WebNotes Same-Origin Policy Bypass	CWE: 254  CVE: 2016-0161	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, it is possible to open a script that uses a javascript origin to then retrieve a file origin resource. This type of cross origin file read should not be possible (as it violates the same-origin policy). However, if a user can be tempted to use the Edge browser's Web Note functionality in a certain manner, this is bypass becomes possible.
Strike Microsoft Internet Explorer Scripting Engine Use After Free Condition	BID: 90012  CWE: 119  CVE: 2016-0189	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically, the vulnerability exists in the VBScript and JavaScript scripting engines. When creating an array in VBScript, heap memory is allocated. When this array size is then later changed, this structure is cleared or freed, however a pointer to this object still remains. It is possible to then access this object causing a use after free condition to occur which results in memory corruption. This type of memory corruption may lead to a denial of service or even remote code execution.
Strike Oracle Application Testing Suite DownloadServlet TMAPReportImage Parameter Directory Traversal	CVE: 2016-0480  BID: 81070	This strike exploits a directory traversal vulnerability in Oracle Application Testing Suite. The vulnerability is due to improper validation of HTTP requests. An attacker could exploit this vulnerability in order to download arbitrary files.
Strike Oracle Application Testing Suite Directory Traversal	CVE: 2016-0481  BID: 81184	This strike exploits a directory traversal vulnerability in Oracle Application Testing Suite. The vulnerability is due to improper validation of HTTP requests. An attacker could exploit this vulnerability in order to download arbitrary files.
Strike Oracle Application Testing Suite DownloadServlet scriptPath Parameter Directory Traversal	CVE: 2016-0484  BID: 81102	This strike exploits a directory traversal vulnerability in Oracle Application Testing Suite. The vulnerability is due to improper validation of HTTP requests. An attacker could exploit this vulnerability in order to download arbitrary files.
Strike Oracle Application Testing Suite ReportImage Directory Traversal Arbitrary File Upload	CVE: 2016-0489  BID: 81184	This strike exploits a directory traversal vulnerability in Oracle Application Testing Suite. The vulnerability is due to improper validation of HTTP request. An attacker could exploit this vulnerability in order to upload arbitrary files.
Strike Oracle Application Testing Suite Directory Traversal Arbitrary File Upload	CVE: 2016-0490  BID: 81173	This strike exploits a directory traversal vulnerability in Oracle Application Testing Suite. The vulnerability is due to improper validation of HTTP request. An attacker could exploit this vulnerability in order to upload arbitrary files.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Application Testing Suite UploadFileUpload Directory Traversal	CVE: 2016-0491 BID: 81169	This strike exploits a directory traversal exploit in Oracle Application Testing Suite. HTTP POST requests to /olt/UploadFileUpload.do do not sanitize for directory traversal characters. An authenticated attacker can send a specially crafted HTTP POST request to upload arbitrary files to any location writable by the Oracle Load Testing service. Note, while this attack requires authentication, it can be paired with the authentication bypass attack, CVE-2016-0492.
Strike Oracle Application Testing Suite Authentication Bypass	CWE: 23 CVE: 2016-0492	This strike exploits an authentication bypass vulnerability in Oracle's Application Testing Suite. The vulnerability is in the isAllowedUrl function which checks for url starting with certain hard coded strings. A remote attacker can exploit this vulnerability by sending crafted request to the vulnerable server. Successful exploitation allows attacker to gain unauthenticated access to affected product.
Strike Apache Jetspeed PageManagementService Persistent XSS	CWE: 79 CVE: 2016-0711	This strike exploits a cross site scripting vulnerability in Apache Jetspeed. Specifically a persistent XSS exists in the updateNodeInfo method of the PageManagementService. The title parameter is not properly sanitized, and an authenticated user can inject javascript via an HTTP request method.
Strike Apache Jetspeed Portal URI Path XSS	CWE: 79 CVE: 2016-0712	This strike exploits an XSS vulnerability in Apache Jetspeed. Specifically the url path is not properly sanitized, and code can be injected into the Help, About, Print, Minimize and Maximize icons. This strike grabs user form fields and alerts them to the user. However, it is possible to load a completely fake form, grab these values and send them to a remote attacker.
Strike Ruby Rails Dynamic Render Directory Traversal	CWE: 22 CVE: 2016-0752	This strike exploits a Directory Traversal vulnerability in the web component of Ruby Rails. The vulnerability is due to unrestricted use of the render method. A remote unauthenticated attacker could exploit this vulnerability by sending a crafted request. Successful exploitation could result in unauthorized file access and leakage of sensitive data.
Strike Jenkins CI Server createItem and createView Insecure Deserialization Command Execution	CWE: 20 CVE: 2016-0792	This strike exploits a command execution vulnerability in Jenkins CI Server. POST requests to /createView or /createItem containing serialized java.util.map objects will be deserialized. An attacker can craft a serialized object to contain an arbitrary command. Successful exploitation will lead to arbitrary command execution.
Strike Advantech WebAccess Dashboard Multiple File Upload Vulnerabilities	CVE: 2016-0854 BID: 80745 EXPLOITDB : 39735	This strike exploits a file upload vulnerability in Advantech WebAccess. WebAccess has several URIs designed to accept image files. These files are not verified, and specially crafted HTTP POST requests can be used to upload any arbitrary file. This includes uploading asp and aspx files, which can then be called to achieve arbitrary asp code execution with the privileges of the IIS service. Successful exploitation may result in creation of arbitrary files and could lead to arbitrary code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Advantech WebAccess FileAjaxAction removeFolder Directory Traversal	CWE: 22 CVE: 2016-0855 BID: 80745	This strike exploits a directory traversal vulnerability in Advantech WebAccess. WebAccess has a removeFolder function which deletes a folder and its contents. It does not sanitize for directory traversal characters. An attacker can send a specially crafted HTTP request to delete arbitrary directories on the target system.
Strike Adobe Flash H264 File Stack Corruption	CWE: 119 CVE: 2016-0967 EXPLOITDB : 39466 GOOGLE: 633	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a stack corruption when Adobe flash loads the FLV file. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike Adobe Flash Zlib Codec Heap Overflow	CWE: 119 CVE: 2016-1001 EXPLOITDB : 39609 GOOGLE: 720 BID: 84310	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow in the Zlib codecs used when playing FLV files in flash. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike PHPMailer Sender Field Command Injection	CWE: 77 CVE: 2016-10033 BID: 95108	This strike exploits a command injection vulnerability in PHPMailer. The sender field is used as a PHP parameter. The field allows space characters to be escaped by using a double quote character. By escaping additional spaces, additional parameters can be injected, which will then be evaluated. An attacker can use this to insert arbitrary parameters to be evaluated, including the -X parameter to write out a log with arbitrary php code, which can then be executed.
Strike PHPMailer Sender Field Improper Patch Command Injection	CWE: 77 CVE: 2016-10045 BID: 95130	This strike exploits an incomplete patch for a command injection vulnerability in PHPMailer. The sender field is used as a PHP parameter. The field originally allowed space characters to be escaped by using a double quote character. By escaping additional spaces, additional parameters can be injected, which will then be evaluated. The patch added escapeshellarg() escaping to prevent this attack. However, this escaping clashes with escapeshellcmd() escaping, which happens later. Due to this clash, the single quote character can be used to achieve the same result on a patched machine. An attacker can use this to insert arbitrary parameters to be evaluated, including the -X parameter to write out a log with arbitrary php code, which can then be executed.

Name	References	Description
Strike PHP phar_parse_pharfile filename_len Integer Overflow	BID: 95774  CWE: 190  CVE: 2016-10159	This strike causes a denial of service in PHP due to a integer overflow when parsing a phar file. The flaw is a bounds check for the filename length field embedded in the file. A malicious file can cause a PHP server to crash.
Strike NETGEAR WNR2000v5 Router hidden_lang_avi Buffer Overflow Vulnerability	CVE: 2016-10174  CWE: 120	This strike exploits a buffer overflow vulnerability in NETGEAR WNR2000v5 Router. The vulnerability is due to a buffer overflow in the hidden_lang_avi parameter when handling HTTP requests to the '/apply.cgi?/lang_check.html' endpoint. An unauthenticated remote attacker could exploit this vulnerability by sending a crafted HTTP request to execute arbitrary OS commands, potentially leading to remote code execution.
Strike D-Link DCS-930L firmware OS Command Injection	CWE: 78  CVE: 2016-11021	This strike exploits an OS Command Injection Vulnerability in D-Link Devices. The vulnerability is due to improper sanitization of user supplied parameter. A remote authenticated attacker could exploit this by sending a crafted packet and might result in remote code execution in the context of root user.
Strike Adobe Flash Out of Bounds When Placing Object	CVE: 2016-1104  BID: 90618  EXPLOITDB : 39825  GOOGLE: 794	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to an out of bounds read when placing a corrupt image. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike NETGEAR Management System NMS300 File Upload Vulnerability	CVE: 2016-1524  BID: 82630	This strike exploits a file upload vulnerability in NETGEAR Management System NMS300. The vulnerability is due to improper unauthenticated access to certain URLs that allow uploading of files and then accessing them. By exploiting this vulnerability an attacker could upload and execute code on the target machine.
Strike NETGEAR Multiple WAP Devices macAddress Command Injection Vulnerability	CWE: 77  CVE: 2016-1555	This strike exploits an OS command injection vulnerability in Netgear Devices. The vulnerability arises due to improper sanitization of user-supplied input in specific PHP scripts, such as boardData102.php, boardData103.php, boardDataNA.php, boardDataJP.php, and boardDataWW.php. A remote, unauthenticated attacker can exploit this vulnerability by injecting commands through the macAddress parameter in these scripts. Successful exploitation of this vulnerability could lead to arbitrary command execution.

Name	References	Description
Strike Novell Service Desk LiveTime File Upload Directory Traversal	CWE: 22 CVE: 2016-1593	This strike exploits a directory traversal vulnerability in Novell Service Desk. Service Desk allows administrators to upload CSV files, however Service Desk fails to validate the file is actually a CSV and does not sanitize for directory traversal characters. An authenticated user could exploit this in order to upload arbitrary files to arbitrary locations. Additionally, Service Desk contains default administrator credentials, which could be used by an attacker to gain authentication.
Strike Hewlett Packard Enterprise Vertica Management Console validateAdminConfig Remote Code Execution	CWE: 77 CVE: 2016-2002	This strike identifies a vulnerability in HP Enterprise Vertica Management Console. Specifically an un-authenticated user is able to perform command injection by sending an HTTP request to the validateAdminConfig URI. The code does not properly sanitize the McPort parameter. However, because it is checked with a command line utility, a user is able to inject and execute shell commands remotely.
Strike Apache Jetspeed User Manager Services REST API Unauthorized Access	CWE: 264 CVE: 2016-2171	This strike exploits a vulnerability in Apache Jetspeed. Specifically the User Manager services allow for unauthorized access via the REST API. Any user is able to query the users directory to create and delete users without having to authenticate via the REST API.
Strike SAP NetWeaver J2EE Engine UDDISecurityImplBean SQL Injection	CWE: 89 CVE: 2016-2386	This strike exploits a SQL injection vulnerability in the web service interface of SAP NetWeaver. The vulnerability is due to insufficient input sanitization in the UDDISecurityImplBean endpoint, specifically within the permissionId parameter of the deletePermissionById method. A remote unauthenticated attacker could exploit this flaw by injecting malicious SQL statements into a SOAP request. Successful exploitation allows the attacker to enumerate sensitive backend data, such as administrative user information and hashed credentials.
Strike Squid Vary Header Long String Denial of Service	CWE: 20 CVE: 2016-2569 BID: 83406	This strike exploits a denial of service vulnerability in Squid Proxy Server. The Vary header consists of comma delimited values. The server expands this header into a comma + space delimited string. This expansion may cause the string to exceed the maximum character limit, which will result in an assertion failure, terminating the Squid process. Successful exploitation will result in abnormal termination of the Squid process, leading to a denial of service condition.
Strike CMS Made Simple Web Server Cache Poisoning	CWE: 79 CVE: 2016-2784 EXPLOITDB : 39760	This strike exploits a vulnerability in CMS Made Simple. CMS Made simple is a content management system that runs on a web server, and helps in creating web sites. A vulnerability exists in how HTTP requests are parsed. Specifically the Host header is not properly validated, and a maliciously crafted header can allow for the Web Server cache to be poisoned. This kind of vulnerability can be leveraged by other kinds of attack vectors like Cross site scripting injection as well as server re-directs.
Strike GD Library libgd gd_gd2 c Heap Buffer Overflow	CWE: 189 CVE: 2016-3074	A heap buffer overflow vulnerability has been reported in libgd. The vulnerability is due to a signedness error that leads to a heap buffer overflow. Libgd is included within PHP. A remote attacker can exploit this flaw having the target process a crafted malicious GD2 file. Successful exploitation could result in code execution in the security context of the user process.

Name	References	Description
Strike Apache Struts Remote Command Execution	BID: 87327 BID: 91787 CWE: 77 CVE: 2016-3081	This strike exploits a remote command execution vulnerability in Apache Struts. An HTTP request with a specially crafted chained expression can be used to execute arbitrary commands. Successful exploitation may result in command execution.
Strike Shopware getTemplateName File Inclusion and Information Disclosure	BID: 97979 CWE: 20 CVE: 2016-3109	This strike exploits a vulnerability in Shopware. Specifically the vulnerability exists in the way the getTemplateName function fails to sanitize input when building the file path and name. If a request is made containing the f or file parameters with directory traversal characters in place a file information disclosure may be possible. This strike illustrates the information disclosure vulnerability, however, due to the nature of the disclosed vulnerability remote code execution may also be possible.
Strike Microsoft Internet Explorer Javascript Library TypedArray Use After Free	BID: 91106 CWE: 119 CVE: 2016-3210	This strike exploits a use after free vulnerability in Microsoft Internet Explorer's Javascript library. Specifically when creating a TypedArray - Array Buffer object with any of the array constructors as a view, and then sending that object as an argument of a worker script message, a use after free condition can occur. This results in memory corruption and can lead to a denial of service or potentially remote code execution.
Strike Microsoft Edge isEqualNode Memory Corruption	CWE: 119 CVE: 2016-3222 BID: 91094	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, the vulnerability exists in the isEqualNode method. An uninitialized local variable used by another function and is later dereferenced, leading to memory corruption. This memory corruption can potentially result in remote code execution or a denial of service condition in the application.
Strike Microsoft Edge TextNode Unicode Character Information Disclosure	BID: 91599 CWE: 284 CVE: 2016-3244	This strike exploits a vulnerability in Microsoft Edge. The vulnerability is due to how UTF encoded characters are handled inside a TextNode object. When these characters are processed the TextNode content's size is not calculated correctly. This incorrect value can then lead to disclose memory information that may lead to the bypass of certain protection mechanisms like ASLR.
Strike Microsoft Internet Explorer and Edge Browser White-space Style Property Memory Corruption	CVE: 2016-3247 BID: 92828	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer and Edge Browsers. Specifically, when the white-space style property of an element is set to pre-line and the element includes a carriage return, an out-of-bound memory read occurs. An attacker can potentially take advantage of this vulnerability to execute code remotely on the target system.

Name	References	Description
Strike Microsoft Internet Explorer and Edge Browser ResProtocol Information Disclosure	CWE: 200 CVE: 2016-3267 BID: 93376	This strike exploits an information disclosure vulnerability in the Microsoft Internet Explorer and Edge Browsers. It is possible for an attacker to attach a readyStateChange event handler to an iframe in such a way that allows information about a Portable Executable file to be disclosed to the user via the Res protocol URI.
Strike Microsoft Internet Explorer Cblob Object Use-After-Free	CWE: 119 CVE: 2016-3288 BID: 92321	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically in Internet Explorer version 11 a Use-After-Free vulnerability exists in the way the browser handles Cblob objects. A FileReader object is created, and then reads a Cblob object in a specific way. If the garbage collector is then called and this freed object is referenced a use after free condition occurs. This leads to a denial of service in the browser, and can potentially lead to remote code execution.
Strike Microsoft Internet Explorer Internet Messaging API Information Disclosure	CWE: 200 CVE: 2016-3298 BID: 93392	This strike exploits an information disclosure vulnerability in Microsoft Internet Explorer. Specifically, when the loadXML function is called on an MSXML DOMDocument with URI set to a malicious MHTML URI, it is possible to discern whether or not a file exists on the target system through errors that are reported back to the user of whether or not that file exists. A malicious user can use abuse this functionality to disclose this information about the target user's system.
Strike Microsoft Internet Explorer and Edge HTTP Continue Response Information Disclosure	BID: 92832 CWE: 200 CVE: 2016-3325	This strike exploits an information disclosure vulnerability in Microsoft Internet Explorer and Edge. An attacker can craft a malicious HTTP Continue response message and cause an out of bounds read condition in the victim's browser. This can potentially lead to an information disclosure.
Strike Microsoft Internet Explorer and Edge Browser Scripting Engine Type Confusion	CWE: 119 CVE: 2016-3382 BID: 93386	This strike exploits a vulnerability in the Microsoft Internet Explorer and Edge Browser's Chakra Scripting Engine. The vulnerability is due to the scripting engine's VarToDispEx function using the ActivationObjectEx object as a pointer to a different javascript function. If this function pointer is assigned to an eval function it is possible to cause type confusion to occur when later referencing this ActivationObjectEx function.
Strike Microsoft Internet Explorer VBScript Join Type Confusion	CWE: 119 CVE: 2016-3385 BID: 93397	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically, a type confusion vulnerability exists in the Microsoft scripting engine's Join function. A malicious attacker can craft code in such a way that when Join is called upon an array object after its contents have been changed, the reference to the original object is kept. If the type of the object in the array has changed it will result in type confusion. It may also be possible to cause a denial of service condition in the browser or achieve remote code execution by corrupting these memory contents in a specified manner.

Name	References	Description
Strike Microsoft Edge CallSpreadFunction Memory Corruption	CWE: 119 CVE: 2016-3386 BID: 93426 EXPLOITDB : 40605	This strike exploits a vulnerability in Microsoft Edge. Specifically if the spread operator is used on an array, the CallSpreadFunction calls spreadArgs in an attempt to split each element into objects. If the length of this array is altered while a different object maintains a reference to this array, the spread operator does not update the new length. An attacker can craft javascript in such a manner that will cause memory corruption to occur, causing a denial of service in the browser and potentially leading to remote code execution.
Strike Adobe Flash ATF Processing Heap Overflow	CVE: 2016-4135 GOOGLE: 786	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow in ATF processing. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike Adobe Flash Player AVC Decoding Memory Corruption	BID: 92930 CWE: 119 CVE: 2016-4275 EXPLOITDB : 40421 GOOGLE: 859	This strike exploits a remote code execution vulnerability in Adobe Flash Player. There is a memory corruption occurs when freeing memory after AVC decoding. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in execution of arbitrary code or abnormal termination of the flash process.
Strike SolarWinds SRM Profiler Multiple SQL Injections	CWE: 89 CVE: 2016-4350	This strike exploits multiple SQL injection vulnerabilities in SolarWinds SRM Profiler. It is possible for a remote authenticated attacker to send an HTTP request to one of several URIs on the Resource monitor that allow for them to inject and execute arbitrary SQL commands via multiple vulnerable parameters per URI. Default Administrator credentials are known and make this attack easily executed remotely.
Strike Apache Struts URLValidator Forward Slashes Denial of Service	CWE: 20 CVE: 2016-4465 BID: 91278	This strike exploits a denial of service vulnerability in Apache Struts. The URLValidator class improperly handles URLs with many forward slash characters during validation. The improper handling leads to resource exhaustion. An attacker can send a specially crafted HTTP request which to a Struts application which accepts URLs as a parameter to exploit this vulnerability. Successful exploitation may result in a denial of service condition.
Strike Trihedral VTScada Wap Filter Bypass	CWE: 287 CVE: 2016-4510 BID: 91077	This strike exploits a filter bypass vulnerability in Trihedral VTScada. Specifically, the VTScada application allows for an un-authenticated user to send http requests to access files with one of several valid file extensions. However, if a null byte character is included with the valid file extension the application processes the string but truncates the file path at the null character. This allows a remote attacker to disclose file information that is not meant to be seen by external users.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Schneider Electric SoMachine HVAC ActiveX Control Memory Corruption	CVE: 2016-4529 BID: 91778	This strike exploits a pointer dereference vulnerability in Schneider Electric's SoMachine HVAC software. Specifically the SetDataIntf method in the AxEditGrid activeX control can be used by an attacker to corrupt memory. This memory corruption can lead to a denial of service condition or possible remote code execution.
Strike Trihedral VTScada Wap Directory Traversal	CWE: 22 CVE: 2016-4532 BID: 91077	This strike exploits a directory traversal vulnerability in Trihedral VTScada. When an un-authenticated user pairs this attack with CVE-2016-4510 ,which allows for a file to specified with the inclusion of a null character, directory traversal characters can be added to the file name and get interpreted as the file path. This allows a remote attacker to effectively traverse the applications directory structure and read documents at will.
Strike Squid Proxy ESI Response Processing Denial of Service	CVE: 2016-4555 CWE: 20	This strike exploits a denial of service vulnerability in the Edge Side Includes (ESI) component of the Squid proxy. The vulnerability is due to incorrect pointer handling when processing ESI responses. A remote attacker could exploit this vulnerability by sending crafted ESI response data to the target system. Successful exploitation allows the attacker to cause a denial of service condition for all clients accessing the Squid service. Note: This strike simulates the request coming from the Squid Proxy to the attacker controller server.
Strike Google Chrome Blink Component Integer Overflow	CWE: 119 CVE: 2016-5182 BID: 93528	This strike exploits a vulnerability in the Google Chrome Blink component. The vulnerability is due to an integer overflow that occurs in the ImageBitmap function when processing a createImageBitmap function with overly large width and height values. When the ImageBitmap function copies these values into a heap buffer an overflow can occur. This can potentially allow for remote code execution.
Strike Symantec Web Gateway Whitelist white_ip Command Execution	CWE: 78 CVE: 2016-5313 BID: 93284	This strike exploits a command execution vulnerability in Symantec Web Gateway. Authenticated requests to the URI / spywall/new_whitelist.php are used to create whitelists. The parameter white_ip is not validated if the sid parameter is non-zero. The value of white_ip will later be used in a shell command, allowing for arbitrary command execution with administrative privileges. An authenticated attacker could send specially crafted HTTP messages to achieve arbitrary command execution with administrative privileges.
Strike Micro Focus GroupWise Post Office Agent Buffer Overflow	CWE: 190 CVE: 2016-5762 BID: 92642	This strike exploits a vulnerability in Micro Focus GroupWise Post Office Agent. An integer overflow can lead to a heap buffer overflow in the GroupWise Post Office Agent. If an unauthenticated user sends a login request with an overly large username or password to the agent a buffer is overflowed. This then leads to a denial of service condition, and can potentially allow for remote code execution to occur.

Name	References	Description
Strike EPIC MyChart - X-Path Injection	CWE: 91 CVE: 2016-6272 EXPLOITDB : 44098	This strike exploits a SQL injection vulnerability in the Epic Systems Corporation MyChart. This vulnerability is due to improper sanitization for the GE parameter "topic". A remote attacker can access contents of an XML document containing static display strings, such as field labels on the target system.
Strike Netgear R7000 Router CGI Command Injection	CWE: 352 CVE: 2016-6277 BID: 94819 EXPLOITDB : 40889	This strike exploits a command execution vulnerability in Netgear R7000 Router Web Interface. The vulnerability is due to improper access checks of the web platform resources. Successful exploitation can result in arbitrary commands via shell metacharacters in the path info to 'cgi-bin'.
Strike WordPress Admin API Directory Traversal	CWE: 22 CVE: 2016-6896	This strike exploits a directory traversal vulnerability inside WordPress. Specifically this occurs when HTTP requests are sent to the admin-ajax page with the action parameter update-plugin set. Directory traversal characters are not handled properly, and an authenticated user can send multiple requests to this API, which will result in a denial of service condition.
Strike FortiOS Cookie Parser Buffer Overflow Vulnerability	CWE: 119 CVE: 2016-6909 BID: 92523 EXPLOITDB : 40276	This strike exploits a buffer overflow vulnerability in FortiGate firmware (FortiOS). The vulnerability is due to failure to sanitize user-supplied input while parsing an HTTP request. An remote, unauthenticated attacker could exploit this vulnerability to remotely execute arbitrary code on the target system. NOTE: A publicly available exploit for this vulnerability can be found in the reported leak of 0Day exploits from the NSA by a group known as the "Shadow Brokers", identified as EGREGIOUSBLUNDER.
Strike Microsoft Edge Browser Chakra Engine Array.map Type Confusion	CWE: 119 CVE: 2016-7190 BID: 93428	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, a type confusion vulnerability exists in the Microsoft Edge module Chakra.dll. A malicious attacker can craft javascript in such a way that when a proxy object is created and Array.map is called upon that object, memory information can be disclosed. It may also be possible to cause a denial of service condition in the browser or achieve remote code execution by corrupting these memory contents in a specified manner.
Strike Microsoft Edge Browser Chakra Engine TemplatdForEachItemInRange Type Confusion	CWE: 119 CVE: 2016-7194 BID: 93399	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, a type confusion vulnerability exists in the Microsoft Edge module Chakra.dll. A malicious attacker can craft javascript in such a way that when the TemplatdForEachItemInRange method is called on an array believing it is of type int, the method will disclose memory contents of the non-integer object in the array.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer and Edge Browsers CLSIDFromHtmlString Function Information Disclosure	CWE: 119 CVE: 2016-7195 BID: 94052	This strike exploits a vulnerability in the Microsoft browsers Edge and Internet Explorer. When the object element's classid parameter is parsed and found to not contain the "clsid:" string, and the characters of this string are non printable, it is possible to read out-of-bounds memory. This can result in a denial of service condition in the browser, or potentially disclose memory contents that may lead to an ASLR bypass.
Strike Microsoft Edge Browser Array.filter Information Disclosure	CWE: 119 CVE: 2016-7200 BID: 93968 GOOGLE: 922	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, in the Chakra javascript engine, it is possible to corrupt memory due to the way that the filter function assumes the destination array is of a certain type, and can end up writing a pointer to an integer array. It is then possible to disclose this pointer information, and it is also possible to corrupt memory in such a way that may cause a denial of service condition in the browser or potentially allow for remote code execution to occur.
Strike Microsoft Edge Browser Chakra Engine Array.shift Type Confusion	CWE: 119 CVE: 2016-7201 BID: 94038	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, a type confusion vulnerability exists in the Microsoft Edge module Chakra.dll. A malicious attacker can craft javascript in such a way that when the Array.shift method is called on an array believing it is always of a certain type, type confusion can occur. This may allow for an attacker to disclose memory contents or potentially execute remote code.
Strike Microsoft Edge Visited Link Information Disclosure	CWE: 79 CVE: 2016-7206 BID: 94737	This strike exploits an information disclosure vulnerability in Microsoft Edge. By utilizing the webkitTextFillColor property an attacker can discern whether or not a link exists in the user's history, and has been visited.
Strike Microsoft Edge Chakra JavaScript Engine EntryEvalHelper Function Memory Corruption	CWE: 119 CVE: 2016-7240 BID: 94046 GOOGLE: 948	This strike exploits a vulnerability in Microsoft Edge. Specifically if an eval function is called from a Proxy object, the EntryEvalHelper function does not properly verify the internal arguments and they get converted to objects of a different type. This creates a type confusion vulnerability. An attacker can craft javascript in such a manner that will cause memory corruption to occur, causing a denial of service in the browser and potentially leading to remote code execution.
Strike Microsoft Edge Browser Chakra Engine JavascriptArray DirectSetItemAt Type Confusion	CWE: 119 CVE: 2016-7242 BID: 94041	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, a type confusion vulnerability exists in the Microsoft Edge module Chakra.dll. A malicious attacker can craft javascript in such a way that when the DirectSetItemAt method is called on an array believing it is of type int, type confusion occurs. This may allow for an attacker to disclose memory contents or potentially execute remote code.

Name	References	Description
Strike Microsoft Internet Explorer CWigglyShape DrawMultiple Memory Corruption	CWE: 119 CVE: 2016-7283 BID: 94726	This strike exploits a vulnerability in the Microsoft Internet Explorer Browser. Specifically, in the CWigglyShape DrawMultiple function a loop is created that draws a segment of a Unicode character during each iteration through the loop. It is possible to corrupt the loop counter causing the loop to not terminate properly and allowing for an out of bounds memory read. This memory corruption can lead to an information disclosure or cause a denial of service condition to occur in the browser, and it may also be possible for remote code execution to occur.
Strike Microsoft Edge SIMD Object toLocaleString Memory Corruption	CWE: 119 CVE: 2016-7286 BID: 94748	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, when the toLocaleString function is called on a SIMD object, uninitialized memory is used to convert numbers to the locale, resulting in memory corruption. This can cause a denial of service condition to occur in the browser, or potentially lead to remote code execution.
Strike Trend Micro Threat Discovery Appliance Policy Upload Information Disclosure	CWE: 361 CVE: 2016-7547 BID: 97610	This strike exploits a vulnerability in Trend Micro's Threat Discovery Appliance. Specifically, a post authentication file disclosure vulnerability exists when using the timezone parameter in the admin_sys_time.cgi interface. A malicious user can dump file contents as the root user when logged in. This exploit can be used in conjunction with CVE 2016-7552, the Trend Micro Threat Discovery Appliance authentication bypass vulnerability, to gain access to the device.
Strike Trend Micro Threat Discovery Appliance Directory Traversal Authentication Bypass	CWE: 22 CVE: 2016-7552 BID: 97599	This strike exploits a directory traversal vulnerability in Trend Micro's Threat Discovery Appliance. A pre-authenticated attacker can send an HTTP request to the device allowing for a configuration file to be deleted. This action may cause of denial of service, and when the server is rebooted, the login password is reset to the default, thus bypassing authentication and allowing the attacker to login.
Strike McAfee ePolicy Orchestrator DataChannel SQL Injection	CWE: 89 CVE: 2016-8027 BID: 95981	An SQL injection vulnerability exists in McAfee ePolicy Orchestrator. The vulnerability is due to insufficient input validation. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP POST request.
Strike Brocade Network Advisor FileReceiveServlet filename Directory Traversal	CWE: 22 CVE: 2016-8204	This strike exploits a directory-traversal vulnerability in Brocade Network Advisor. The vulnerability is due to lack of input-validation on the filename parameter for FileReceiveServlet. A remote attacker could exploit this vulnerability to upload arbitrary files and result in arbitrary code execution with privileges of the SYSTEM.
Strike Brocade Network Advisor DashboardFileRecei veServlet Directory Traversal Vulnerability	CVE: 2016-8205	This strike exploits a directory traversal vulnerability in Brocade Network Advisor. The vulnerability resides in the DashboardFileReceiveServlet servlet due to insufficient input validation of the filename parameter in HTTP multipart form requests. A remote, unauthenticated attacker could exploit this vulnerability to upload malicious files, potentially leading to arbitrary code execution with SYSTEM privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Brocade Network Advisor CliMonitorReportServlet FILENAME Directory Traversal	BID: 95691 CWE: 22 CVE: 2016-8207	This strike exploits a directory-traversal vulnerability in Brocade Network Advisor. The vulnerability is due to lack of input-validation on the FILENAME parameter. A remote attacker could exploit this vulnerability to read arbitrary files from the targeted system.
Strike Joomla Account Creation Security Bypass	CWE: 20 CVE: 2016-8869 BID: 93883 EXPLOITDB : 40637	This strike exploits an account creation security bypass in Joomla. The vulnerability is due to improper validation of HTTP POST data to index.php/component/users. An attacker could exploit this vulnerability in order to create an account on the target server.
Strike Joomla Privilege Escalation Vulnerability	CWE: 20 CVE: 2016-8870 BID: 93876 EXPLOITDB : 40637	This strike exploits a privilege escalation vulnerability in Joomla. The vulnerability is due to improper validation of HTTP POST data to index.php/component/users. An attacker could exploit this vulnerability in order to create an admin account on the target server.
Strike Mozilla Firefox SVG Animation NotifyTimeChange Use After Free	CWE: 416 CVE: 2016-9079 BID: 94591	This strike exploits a use-after-free vulnerability in the Mozilla Firefox and Tor Browsers on the Windows platform. Specifically the vulnerability exists in the SVG animation function nsSMILTimeContainer::NotifyTimeChange(). This is a remote code execution vulnerability in Firefox Browser versions less than 50.0.2. A vulnerable version of the application can run code of the attacker's choosing at will.
Strike Microsoft Edge Same Origin Bypass Information Disclosure	CVE: 2017-0002 BID: 95284	This strike exploits a policy bypass vulnerability in the Microsoft Edge Browser. Specifically, a domainless page is not prevented from modifying another domainless page even if they are from different domains. A redirect loads a website from a different domain. If this site contains an empty iframe, the code embedded within the URL, that is used to perform the redirect, will inject code into this empty iframe. This achieves code execution and allows for remote information disclosure across a different domain. This is also achievable if the site does not contain an empty iframe. In this case the code in the URI creates an empty frame first by modifying an existing iframe and injects code into that iframe.
Strike Microsoft Edge Getter Use After Free	CWE: 416 CVE: 2017-0070 BID: 96690	This strike exploits a vulnerability that exists in Microsoft Edge. An attacker can craft Javascript in a way that causes a Use After Free condition to occur when the NativeCodeGenerator::CheckCodeGenThunk function is called on a pointer that has had its memory freed. This can cause a denial of service in the browser or potentially allow for remote code execution to occur.

Name	References	Description
Strike Microsoft Internet Explorer JoinToString Function Type Confusion	CWE: 119 CVE: 2017-0130 BID: 96647	This strike exploits a vulnerability in Microsoft Internet Explorer. Specifically, an attacker can craft javascript in such a way that overwrites the eval method and calls the Javascript function JoinToString with an object that is not of the expected writeableString type. This causes type confusion to occur and can lead to a denial of service condition in the browser or potentially remote code execution.
Strike Oracle GlassFish OSE Path Traversal	CWE: 22 CVE: 2017-10000 28 EXPLOITDB : 39441	This strike exploits a directory traversal found in GlassFish open source Java EE project. The vulnerability is due to insufficient user input sanitization passed through the URI, addressing various resources. A specially crafted HTTP GET request could allow an attacker to read arbitrary files from the file system.
Strike Primetek Primefaces Padding Oracle Remote Code Execution	CWE: 326 CVE: 2017-10004 86	This strike exploits a command injection vulnerability in the web component of Primetek Primefaces. The vulnerability is due to inadequate encryption strength. A remote attacker could exploit this vulnerability by sending a crafted request using the known password or the default password. Successful exploitation could result in arbitrary command execution under the security context of the root user.
Strike Oracle WebLogic Server WorkContextXmlInputAdapter Insecure Deserialization - RCE	CVE: 2017-10271 BID: 101304	An insecure deserialization vulnerability was found in Oracle WebLogic Server due to insufficient validation of serialized XML data. Vulnerability can be exploited by sending a specially crafted serialized object. Successful exploitation can result in arbitrary code execution in the context of the user running WebLogic.
Strike IBM Informix Dynamic Server heap buffer overflow	CVE: 2017-1092 BID: 98615	This strike exploits a heap buffer overflow in IBM Informix Dynamic Server heap buffer overflow. The vulnerability is due to lack of input validation of HTTP post request to index.php. This vulnerability could allow an unauthorized user to execute arbitrary code as system admin on Windows servers
Strike IBM Informix Open Admin welcomeService Command Execution	CVE: 2017-1092	An input validation vulnerability has been found in IBM Informix Open Admin Tool. The vulnerability is due to improper parsing of user-supplied input to the SOAP interface. Successful exploitation can result in arbitrary code execution in the security context of the SYSTEM user.
Strike YAWS Unauthenticated Remote File Disclosure	CWE: 22 CVE: 2017-10974 BID: 99515 EXPLOITDB : 42303	This strike exploits a local file information disclosure vulnerability in YAWS application. The root cause of this flaw is a directory traversal vulnerability. The vulnerability is due to invalidation of user input sent in requested URLs. Successful exploitation will allow an attacker to obtain sensitive information from the server, including SSL private key, configuration files and access logs.

Name	References	Description
Strike Synology Photo Station Arbitrary File Upload	CWE: 287 CVE: 2017-11151 EXPLOITDB : 42434	This strike exploits an Arbitrary File Upload vulnerability in Synology Photo Station. The vulnerability is due to improper input validation of user controlled input. A remote, unauthenticated attacker can upload arbitrary files to the target server.
Strike Synology Photo Station PixlrEditorHandler Directory Traversal	CWE: 22 CVE: 2017-11152 EXPLOITDB : 42434	This strike exploits a Directory Traversal vulnerability in Synology Photo Station. The vulnerability is due to improper input validation of the path parameter and incorrect session management. A remote, unauthenticated attacker can write arbitrary files to the target server and log in using a fake authentication mechanism.
Strike ManageEngine ServiceDesk download-file Directory Traversal	CWE: 200 CVE: 2017-11511 BID: 101788	This strike exploits a directory traversal vulnerability in ManageEngine ServiceDesk. HTTP GET requests to the /fosagent/repl/download-file are intended to download files from a specific directory. However, the filepath parameter is not sanitized for directory traversal characters. An attacker can send an HTTP GET request with a specially crafted filepath parameter to download arbitrary files from the target system.
Strike ManageEngine ServiceDesk DownloadSnapshotServlet Directory Traversal	CWE: 22 CVE: 2017-11512 BID: 101789	This strike exploits an absolute path traversal vulnerability in the DownloadSnapshotServlet module on the ManageEngine ServiceDesk application. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in the disclosure of arbitrary file contents from the target server.
Strike Microsoft Edge Javascript ParseCatch Type Confusion	CWE: 119 CVE: 2017-11764 BID: 100726	This strike exploits a vulnerability in Microsoft Edge. Specifically, the vulnerability exists within the Chakra engine's ParseCatch function. It is possible to craft javascript in a way that causes type confusion to occur if a catch statement contains an eval function that is encapsulated in a destructuring assignment declaration. This can lead to a memory access violation causing a denial of service in the browser or potentially allowing for remote code execution to occur.
Strike Microsoft Edge Chakra Engine JIT Compiler Incorrect Instruction GenerateBailOut for Patterns	CWE: 119 CVE: 2017-11799 BID: 101126 GOOGLE: 1333 EXPLOITDB : 42998	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to create Javascript in such a way that a change to the opcode of an instruction can generate a bailout but some calling patterns are not considered, and some pointers are not freed or unlinked. This may lead to a denial of service condition in the browser, or potentially remote code execution.

Name	References	Description
Strike Microsoft Edge Chakra Uninitialized Pointers in BoxState Box	CWE: 119 CVE: 2017-11809 GOOGLE: 1338 BID: 101137 EXPLOITDB : 42999	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that uninitialized local variables can be accessed. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge DoBodyLoopStart Out of Bounds Memory Read	CWE: 119 CVE: 2017-11811 BID: 101138	This strike exploits a vulnerability in Microsoft Edge. Specifically, the vulnerability exists within the Chakra engine's DoBodyLoopStart function. When iterating through a loop that contains a switch statement, it is possible to craft javascript in a way that causes an out of bounds memory read. The DoBodyLoopStart function calls compiled code that contains an offset to read a memory address outside the bounds of the allocated dynamic code, which leads to an out-of-bounds memory read.
Strike Microsoft Edge Chakra Engine InlineCallApplyTarget_Shared Incorrect Return	CWE: 119 CVE: 2017-11841 BID: 101733 GOOGLE: 1366 EXPLOITDB : 43181	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to create Javascript in such a way that when a call is made to an Inlinee method the returned method is incorrect and it will potentially skip returning the proper instruction. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Internet Explorer Jscript.dll ArraySlice Uninitialized Variable	CWE: 119 CVE: 2017-11855 BID: 101751 GOOGLE: 1378 EXPLOITDB : 43371	This strike exploits a vulnerability in the Microsoft Internet Explorer browser. Specifically, the vulnerability exists in jscript.dll. It is possible to create an uninitialized type variable when making a call to JsArraySlice. This may lead to a denial of service condition in the browser, or potentially remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Edge Chakra Lower Bounds Integer Overflow	CWE: 119 CVE: 2017-11861 BID: 101723 GOOGLE: 1343	This strike exploits a vulnerability in Microsoft Edge. Specifically, the vulnerability exists within the Chakra engine's LowerBoundCheck function. It is possible to craft javascript in such a way, that on a 64bit system, LowerBoundCheck will incorrectly determine whether or not an integer overflow has occurred. When a TypedArray is accessed as a 64bit integer an out of bounds memory access will occur. This can cause a denial of service or potentially lead to remote code execution.
Strike Microsoft Edge Chakra Function Declaration Scope Type Confusion	CWE: 119 CVE: 2017-11870 BID: 101731 GOOGLE: 1367 EXPLOITDB : 43182	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to incorrectly optimize arguments in Javascript, which may cause type confusion to occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Internet Explorer Jscript RegExpCompile Buffer Overflow	CWE: 119 CVE: 2017-11890 GOOGLE: 1369 EXPLOITDB : 43369 BID: 102082	This strike exploits a vulnerability in the Microsoft Internet Explorer browser. Specifically, the vulnerability exists in the Javascript engine. It is possible to craft Javascript in such a way that causes a heap overflow when compiling a Regular Expression. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra MinInAnArray MaxInAnArray Type Confusion	CWE: 119 CVE: 2017-11893 BID: 102081 GOOGLE: 1379 EXPLOITDB : 43466	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the javascript Chakra engine. Javascript can be crafted in such a way that allows for type confusion to occur when MinInAnArray or MaxInAnArray methods are called to return the largest or smallest of a series of numbers. The functions fail to properly validate the input and can instead change the type from a JavascriptNativeArray to a VarArray causing type confusion to occur. This may cause a denial of service condition in the browser, or potentially lead to remote code execution.

Name	References	Description
Strike Microsoft Internet Explorer Jscript LastParen Out of Bounds Read	CWE: 200 CVE: 2017-11906 GOOGLE: 1382 EXPLOITDB : 43372 BID: 102078	This strike exploits a vulnerability in the Microsoft Internet Explorer browser. Specifically, the vulnerability exists in the Javascript engine. It is possible to craft Javascript in such a way that causes an out of bounds read in the jscriptRegExpFncObj::LastParen method. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra ASM Out of Bounds Read	CWE: 119 CVE: 2017-11911 BID: 102087 GOOGLE: 1385 EXPLOITDB : 43468	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the javascript Chakra engine. It is possible to create javascript in such a way that an out of bounds read can occur in ASM.js. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra GetPropertyBuiltins scriptFunction Type Confusion	CWE: 119 CVE: 2017-11914 BID: 102088 GOOGLE: 1403 EXPLOITDB : 43713	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the javascript Chakra engine. It is possible to create javascript in such a way that allows for the scriptFunction to be exposed to the user as 'this' when getting the length property. When this happens type confusion occurs. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra JIT Escape Analysis	CWE: 119 CVE: 2017-11918 BID: 102089 GOOGLE: 1396 EXPLOITDB : 43469	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the javascript Chakra engine. It is possible to create javascript in such a way that allows for created variables to escape analysis and get allocated to the stack. This can then allow for the dereference of uninitialized stack values. This may lead to a denial of service condition in the browser, or potentially remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cisco License Manager Server ReportCSV Directory Traversal	CWE: 22 CVE: 2017-12263	This strike exploits an information disclosure in Cisco License Manager Server. The vulnerability is due to insufficient validation on user supplied paths when a request is sent to ReportCSV servlet. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target system. Successful exploitation results in the disclosure of the contents of arbitrary files from the target system.
Strike Cisco Prime Network Analysis Module Graph sfile Parameter Directory Traversal	CWE: 20 CVE: 2017-12285 BID: 101527	This strike exploits a directory traversal vulnerability in Cisco Prime Network Analysis Module. The sfile parameter of HTTP requests to /capture/graph.php is intended to read and delete a specified graph file. It is not sanitized for directory traversal characters. An attacker can send specially crafted HTTP requests to delete arbitrary files.
Strike HPE Intelligent Management Center saveSelectedDevices Expression Language Injection	CWE: 20 CVE: 2017-12491 BID: 100367	This strike exploits An Expression Language injection vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. The vulnerability is due to improper input validation of HTTP POST request payload. A remote, authenticated attacker can execute arbitrary code on the targeted system by sending a crafted HTTP request to the target server.
Strike HPE Intelligent Management Center ictExpertDownload beanName Expression Language Injection	CWE: 20 CVE: 2017-12500 BID: 100367	This strike exploits An Expression Language injection vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. The vulnerability is due to improper input validation of HTTP request parameters. A remote, authenticated attacker can execute arbitrary code on the targeted system by sending a crafted HTTP request to the target server.
Strike HPE Intelligent Management Center userSelectPagingContent beanName Expression Language Injection	CWE: 20 CVE: 2017-12521 BID: 100367	This strike exploits an Expression Language Injection vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. The vulnerability is due to improper input validation of HTTP request parameters. A remote, authenticated attacker can execute arbitrary code on the targeted system by sending a crafted HTTP request to the target server.
Strike HPE Intelligent Management Center wmiConfigContent beanName Expression Language Injection	CWE: 20 CVE: 2017-12526 BID: 100367	This strike exploits An Expression Language injection vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. The vulnerability is due to improper input validation of the beanName HTTP request parameter. A remote, authenticated attacker can execute arbitrary code on the targeted system by sending a crafted HTTP request to the target server.
Strike HPE iLO 4 1.00-2.50 Administrator Account Creation	CVE: 2017-12542 BID: 100467	This strike exploits an authentication bypass vulnerability in HPE Integrated Lights-out (iLO 4). This vulnerability is due to inadequate input filtering in the HTTP Connection header. The vulnerability could be exploited remotely by creating an administrator account and then execution of code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HPE System Management Homepage gsearch.php.en Cross-Site Scripting (XSS)	CWE: 79 CVE: 2017-12544 BID: 101029	This strike exploits a cross-site scripting vulnerability in HPE System Management Homepage. This vulnerability is due to inadequate input filtering in "prod" field. By exploiting this vulnerability an attacker could cause arbitrary scripting code to be executed by the target user's browser.
Strike HPE intelligent Management Center WebDMDebugServlet Remote Code Execution	CWE: 502 CVE: 2017-12557 BID: 101152 EXPLOITDB : 45952	An insecure deserialization vulnerability exists in HPE intelligent Management Center PLAT v7.3 E0504. The flaw arises due to lack of security checks when processing the POST payload for the '/imc/topo/WebDMDebugServlet' endpoint. Successful attacks result in arbitrary remote code execution with root privileges.
Strike HPE Intelligent Management Center imcweb_dm.jar Remote Code Execution	CWE: 502 CVE: 2017-12558 BID: 101152	This strike exploits a remote code execution vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. The vulnerability is due to insecure deserialization of user input data sent through HTTP. A remote, unauthenticated attacker can run arbitrary commands on the targeted system by sending a crafted HTTP request to the target server.
Strike Apache Struts2 Freemarker Tag Code Execution	CWE: 20 CVE: 2017-12611 BID: 100829	This strike exploits a remote code execution vulnerability in Apache Struts2. When using an unintentional expression in Freemarker tag instead of string literals, it is possible for an attacker to craft a malicious payload that may allow for remote code execution to occur.
Strike Apache Tomcat JSP Upload Remote Code Execution	CWE: 434 CVE: 2017-12615 BID: 100901	This strike exploits a remote command execution vulnerability in Apache Tomcat. The vulnerability allows attackers to upload arbitrary files to the Tomcat application server by utilizing the HTTP PUT method. By uploading a .JSP file to the Tomcat Application Server, an attacker can execute malicious code on the remote machine.
Strike Apache Tomcat Misconfigured HTTP PUT Remote Code Execution	CWE: 434 CVE: 2017-12617	This strike exploits a file upload vulnerability in Apache Tomcat. The vulnerability arises from a misconfiguration in handling PUT requests. When Tomcat is configured with readonly set to false and PUT requests are allowed, attackers can upload files with names ending in ".jsp///". Tomcat removes the trailing slashes, saving the file as a ".jsp" that includes attacker-controlled data. A remote, unauthenticated attacker can exploit this vulnerability by sending a PUT request with a malicious payload in the .jsp file, which executes when accessed. Successful exploitation could result in remote code execution within the context of the user running the Apache Tomcat.

Name	References	Description
Strike Apache Solr RunExecutableListener Code Execution	CWE: 611 CVE: 2017-12629 BID: 101261 EXPLOITDB : 43009	This strike exploits a remote code execution in Apache Solr. The vulnerability exists due to Apache Solr RunExecutableListener class can be used to execute arbitrary commands on postCommit or newSearcher events. Successful exploitation will result in code execution.
Strike Apache Solr Xmlparser XXE Expansion	CWE: 611 CVE: 2017-12629 BID: 101261 EXPLOITDB : 43009	This strike exploits an XML External Entity expansion vulnerability in Apache Solr. The vulnerability exists due to insufficient checking when handling the incoming XML external entities. Successful exploitation will result in code execution.
Strike Apache CouchDB Remote Privilege Escalation	CWE: 269 CVE: 2017-12635 BID: 101868	This strike exploits a remote privilege escalation vulnerability in Apache CouchDB. The vulnerability is due to insufficient validation of user-supplied JSON objects. Successful exploitation will allow an attacker to create an administrative account within CouchDB.
Strike Apache CouchDB Remote Code Execution	CWE: 78 CVE: 2017-12636	This strike exploits a remote code execution vulnerability in Apache CouchDB. CouchDB administrative users can configure the database server via HTTP. Some of the configuration options include paths for operating system-level binaries that are subsequently launched by CouchDB. Successful exploitation will allow a CouchDB admin user to execute arbitrary shell commands as the CouchDB user.
Strike Cacti spikekill php Cross-Site Scripting	CWE: 79 CVE: 2017-12927	This strike exploits a reflected cross-site scripting vulnerability in Cacti. This vulnerability is due to improper validation of the method parameter within spikekill.php. The method value should be one of the stddev, float, variance, or fill. A remote attacker could exploit this vulnerability by enticing an authenticated user to visit a maliciously crafted URL in which the value of method is not one of the previously mentioned values. Successful exploitation could lead to arbitrary script code execution in the context of the user's browser.
Strike TP-Link WiFi router Authenticated PingIframeRpm Stack Buffer Overflow	CWE: 119 CVE: 2017-13772 EXPLOITDB : 43022	This strike exhibits the network behavior of a buffer overflow vulnerability inside TP-Link WiFi router. The vulnerability is due do insufficient user input validation passed to 'ping_addr' parameter pertaining to 'PingIframeRpm.htm' form. By crafting a malicious HTTP request, an attacker can cause DoS conditions or achieve code execution on the target device.

Name	References	Description
Strike Apple Safari WebKit WebCore FormSubmission create Use After Free	CWE: 119 CVE: 2017-13791 GOOGLE: 1355	This strike exploits a vulnerability in Apple Safari WebKit. Specifically the vulnerability exists in WebKit's WebCore::FormSubmission::create method. An attacker can craft javascript in such a way that when invoking the create method in a form a use after free condition can occur. This can lead to a denial of service or potentially allow for remote code execution on the vulnerable system.
Strike Apple Safari WebKit WebCore RenderObject previousSibling Use After Free	CWE: 119 CVE: 2017-13798 GOOGLE: 1354	This strike exploits a vulnerability in Apple Safari WebKit. Specifically the vulnerability exists in WebKit's WebCore::RenderObject::previousSibling method. An attacker can craft javascript in such a way that when invoking the create method in a form a use after free condition can occur. This can lead to a denial of service or potentially allow for remote code execution on the vulnerable system.
Strike Trend Micro Mobile Security Enterprise slink_id SQL injection	CWE: 89 CVE: 2017-14078 BID: 100966	This strike exploits a SQL injection vulnerability in Trend Micro Mobile Security Enterprise. The slink_id HTTP parameter is vulnerable to SQL injection. slink_id can also be accessed via JSON in the HTTP request body. An attacker can send a specially crafted HTTP request to achieve SQL injection. Successful exploitation may lead to arbitrary SQL code execution with SYSTEM privileges.
Strike Dell EMC Storage Manager Server Directory Traversal	BID: 103467 CWE: 22 CVE: 2017-14384	The vulnerability allows attackers read access to arbitrary file contents accessible in the Dell EMC Storage Manager server by insufficient validation of user input on requests. Successful exploitation could result in arbitrary file accessible on target with SYSTEM privileges.
Strike NetIQ Access Manager Identity Server Directory Traversal	CVE: 2017-14803 BID: 100901	The vulnerability allows attackers read access to arbitrary file contents accessible in the Micro Focus NetIQ Access Manager server by insufficient validation of user input on requests sent to the OspUIBasicSSODownload servlet.
Strike Bacula-Web job.php GET request SQL Injection	CWE: 89 CVE: 2017-15367	An SQL injection vulnerability exists in Bacula Web appliance. The vulnerability is due to insufficient user-supplied input validation within job.php script. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP GET request.
Strike Apache httpd FilesMatch Policy Bypass	CWE: 20 CVE: 2017-15715 BID: 103525	This strike exploits a policy bypass vulnerability in Apache httpd FilesMatch. FilesMatch is intended to prevent files which do not match certain regex patterns to be uploaded via HTTP PUT messages. One of these patterns is AP_REG_DOLLAR_ENDONLY, which is intended to prevent files ending with the character. However, this option does not work properly, allowing for files ending with to be uploaded. An attacker can send a specially crafted HTTP PUT message to bypass the policy and upload arbitrary files.

Name	References	Description
Strike Palo Alto Networks Management Interface Authentication Bypass	CVE: 2017-15944 EXPLOITDB : 43342 BID: 102079	This strike exploits a management interface authentication bypass vulnerability in Palo Alto Networks PAN-OS 6.1.18 and earlier, PAN-OS 7.0.18 and earlier, and PAN-OS 7.1.13 and earlier. Note: A remote user can exploit a combination of vulnerabilities in the management interface to execute arbitrary commands on the target system. The code will run with root privileges. This strike simulates panAuthCheck authentication bypass.
Strike NetGain Systems Enterprise Manager settings.upload filename Directory Traversal	CWE: 668 CVE: 2017-16603 BID: 102307	This strike exploits a vulnerability in NetGain Systems Enterprise Manager prior to v7.2.766. The vulnerability is caused by insufficient validation of user input in http requests. Successful exploitation could result in arbitrary file accessible on target server.
Strike Roundcube Webmail timezone File Disclosure Vulnerability	CWE: 552 CVE: 2017-16651	This strike exploits Local File Inclusion vulnerability in Roundcube webmail. The vulnerability occurs due insufficient input validation in conjunction with the file-based attachment plugins. An authenticated remote attacker with an active session can exploit this vulnerability by sending crafted request to the server. Successful exploitation of this vulnerability leads to information disclosure by accessing arbitrary files
Strike Advantech WebAccess SCADA gmicons.asp Arbitrary File Upload	CWE: 434 CVE: 2017-16736	An arbitrary file overwrite vulnerability has been identified in Advantech WebAccess SCADA web platform. The vulnerability is caused by the lack of proper input sanitisation of the gmicons.asp picfile parameter. The vulnerability can be exploited by sending a specially-crafted request, allowing the attacker to execute code on the remote machine with the privileges of the application process.
Strike Huawei HG532 Router Remote Command Execution	CWE: 20 CVE: 2017-17215 BID: 102344	This strike exploits a remote command execution vulnerability in Huawei HG532 Router. The vulnerability is due to insufficient validation of NewDownloadURL and NewStatusURL in SOAP XML. The exploit has been used in okiru/satori, a variant of Mirai.
Strike Ruby Net FTP Command Injection	CWE: 78 CVE: 2017-17405 BID: 102204 EXPLOITDB : 43381	This strike exploits a remote command injection vulnerability in Ruby before 2.4.3. The vulnerability is due to ruby NET::FTP, which will execute any command after the " " pipe character in the localfile argument. This vulnerability could allow an unauthorized user to execute arbitrary code on the server.

Name	References	Description
Strike Quest NetVault Backup NVBUEventHistory SQL Injection	CWE: 89 CVE: 2017-17412 BID: 102252	An SQL injection vulnerability exists in Quest NetVault Backup appliance. The vulnerability is due to insufficient user-supplied input validation within Server Process Manager Service. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP request.
Strike Quest NetVault Backup NVBUTransferHistory SQL Injection	CWE: 89 CVE: 2017-17419	An SQL injection vulnerability exists in Quest NetVault Backup appliance. The vulnerability is due to insufficient user-supplied input validation within Server Process Manager Service. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP GET request.
Strike Quest NetVault Backup NVBUJobCountHistory SQL Injection	CWE: 89 CVE: 2017-17420 BID: 102252	An SQL injection vulnerability exists in Quest NetVault Backup appliance. The vulnerability is due to insufficient user-supplied input validation within Server Process Manager Service. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP request.
Strike EmbedThis GoAhead Web Server Code Execution	CWE: 20 CVE: 2017-17562	This strike exploits a remote code execution vulnerability in EmbedThis GoAhead Web Server. The vulnerability is due to insufficient validation of CGI variables. To exploit the vulnerability, an attacker would create a HTTP CGI request that uses sets LD_PRELOAD=/proc/self/fd/0 in the query string and sets the POST data of the request to be in the form of a malicious shared library for the architecture of the device.
Strike Zyxel P660HN-T1A Routers Command Injection Vulnerability	CVE: 2017-18368 CWE: 78	This strike exploits an OS command injection vulnerability in Zyxel P660HN-T1A Routers. The vulnerability is due to the improper neutralization of special elements in the parameter "remote_host". An unauthenticated attacker could exploit this vulnerability by executing some OS commands by sending a crafted HTTP request and might result in remote code execution.
Strike MacOS HelpViewer x-help-script XSS Path Traversal and Local File Read	CWE: 79 CVE: 2017-2361 GOOGLE: 1040 BID: 95723	This strike exploits a vulnerability in MacOS HelpViewer. Specifically, HelpViewer's WebView has a protocol handler x-help-script, that can be used to access a local file via path traversal. An attacker can craft javascript that will allow for an XMLHttpRequest to open this local file. This strike demonstrates this by opening one of the following apps, Calculator, Messages, Preview, or Notes, by accessing this HTML on a remote server with a vulnerable version of MacOS.

Name	References	Description
Strike Adobe Flash ATF Thumbnailing Heap Overflow	CWE: 119 CVE: 2017-2933 GOOGLE: 1015 BID: 95347	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow related to texture compression. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike Adobe Flash ATF Planar Decompression Heap Overflow	CWE: 119 CVE: 2017-2934 GOOGLE: 1016 BID: 95347	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow in planar block decompression. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike Adobe Flash AVC Header Slicing Heap Overflow	CWE: 119 CVE: 2017-2935 GOOGLE: 1017 BID: 95347	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to a heap overflow in AVC header slicing. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike Adobe Flash FLV YUVPlane Decoding Heap Overflow	CWE: 119 CVE: 2017-2986 GOOGLE: 1008 BID: 96193	This strike exploits a remote code execution vulnerability in Adobe Flash Player. The vulnerability is due to an heap overflow in YUVPlane decoding. An attacker can entice a target to open a specially crafted flash file to trigger the vulnerability. Successful exploitation may result in abnormal termination of the flash process.
Strike Oracle Fusion Middleware MapViewer Code Execution	CVE: 2017-3230 BID: 97746	This strike exploits a Code Execution vulnerability in the Oracle Fusion Middleware MapViewer component of Oracle Fusion Middleware. Successful attacks of this vulnerability can result in unauthorized creation, deletion or modification access to critical data.
Strike Oracle WebLogic Server OS Command Injection Vulnerability	CWE: 78 CVE: 2017-3506	This strike exploits an OS command injection vulnerability in Oracle WebLogic Server. The vulnerability is caused by insecure deserialization of untrusted data. A remote, unauthenticated attacker could exploit this vulnerability by sending a specially crafted serialized object to the vulnerable WebLogic Server. When the server processes this object, it deserializes the data, leading to the execution of the attacker's code.

Name	References	Description
Strike Spring Web Flow SPEL Command Injection	CWE: 1188 CVE: 2017-4971 BID: 98785	This strike exploits a remote command injection vulnerability in the Pivotal Spring Web Flow framework. The vulnerability exists due to insufficient validation of binding SPEL expression. The vulnerability can be exploited by sending a specially crafted HTTP request, allowing arbitrary command injection.
Strike Google Chrome Javascript V8 Array.indexOf Information Leak	CWE: 200 CVE: 2017-5040 BID: 96767 GOOGLE: 691323	This strike exploits a vulnerability in the Google Chrome Browser. Specifically, the vulnerability exists in the Javascript V8 engine. It is possible to craft Javascript in such a way that when calling Array.indexOf, properties of the array can be changed, and certain values in memory can be disclosed to the user.
Strike Google Chrome Javascript V8 Out of Bounds Read	CWE: 125 CVE: 2017-5053 GOOGLE: 702058 BID: 97220	This strike exploits a vulnerability in the Google Chrome Browser. Specifically, the vulnerability exists in the Javascript V8 engine. It is possible to craft Javascript in such a way that an out of bounds read of memory can occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Google Chrome Javascript Crankshaft Type Confusion	CWE: 704 CVE: 2017-5070 BID: 98861	This strike exploits a vulnerability in Google Chrome. Specifically, the vulnerability exists within Chrome's javascript engine V8. When javascript is encountered, the V8 engine sends the code to Crankshaft to be optimized. It is here where the vulnerability is found when validating two pointers. One pointer may point to a constant, and the other may point to a different unexpected object type. Further processing of this code can lead to type confusion. This will cause a denial of service in the browser, and can potentially lead to remote code execution.
Strike Google Chrome Javascript V8 Engine FindSharedFunction Info Out of Bounds Read	CWE: 125 CVE: 2017-5071 GOOGLE: 715582 BID: 98861	This strike exploits a vulnerability in the Google Chrome Browser. Specifically, the vulnerability exists in the Javascript V8 engine. It is possible to craft Javascript in such a way that an out of bounds read will occur in FindSharedFunctionInfo. This may lead to a denial of service condition in the browser, or potentially remote code execution.

Name	References	Description
Strike Google Chrome WebGL2 ReadPixels Buffer Overflow	CWE: 119 CVE: 2017-5112 BID: 100610 GOOGLE: 740603	This strike exploits a vulnerability in Google Chrome. Specifically, the vulnerability exists within the WebGL2 library's ReadPixels function. It is possible to craft javascript in such a way that when the rows of pixel data of a webgl2 canvas are read and copied to an offset with the PACK_SKIP_ROWS parameter, a heap buffer overflow can occur. This can cause a denial of service or potentially lead to remote code execution.
Strike Advantech WebAccess Template.aspx SQL Injection	CWE: 89 CVE: 2017-5154 BID: 95410	This strike exploits a SQL injection in Advantech WebAccess 8.1. The vulnerability is due to improper sanitization of user supplied input in template parameter. By exploiting this vulnerability, an authenticated attacker can execute arbitrary SQL queries on the server.
Strike PHPMailer Local Information Disclosure	CWE: 200 CVE: 2017-5223 BID: 95328 EXPLOITDB : 43056	This strike exploits a local information disclosure vulnerability in PHPMailer. The vulnerability is due to insufficient validation of user-supplied input by the msgHTML function. Successful exploitation will allow an attacker to obtain sensitive information on the server.
Strike Mozilla Firefox Table Use-After-Free	BID: 96664 CWE: 416 CVE: 2017-5404 GOOGLE: 1130	This strike exploits a remote code execution vulnerability in Mozilla Firefox. The vulnerability can be triggered by manipulating range elements within selections. Successful exploitation of this vulnerability could result in the execution of arbitrary code on the target system.
Strike Mozilla Firefox http-index-format File Buffer Overflow	CWE: 119 CVE: 2017-5444 BID: 97940	This strike exploits a buffer overflow vulnerability in Mozilla Firefox. When parsing content-type application/http-index-format data, it is possible for an out of bounds read of memory to occur causing a buffer overflow. This can cause a denial of service condition in the browser or potentially allow for remote code execution to occur.
Strike Apache Struts2 OGNL Command Execution	BID: 96729 CWE: 20 CVE: 2017-5638	This strike exploits a remote command execution vulnerability in Apache Struts. An HTTP request with a specially crafted content-type can be used to execute arbitrary commands. Successful exploitation may result in command execution.

Name	References	Description
Strike Intel AMT Remote PRivilege Escalation Vulnerability	CVE: 2017-5689 BID: 1038385	This strike exploits a privilege escalation vulnerability in Intel Active Management Technology. The vulnerability is due to improper input validation when checking parameters in the Authorization HTTP request header. An unprivileged attacker can gain system privileges of AMT by sending an HTTP Digest authentication request with an empty response parameter.
Strike Spectre Attack (Variant 1 Bounds Check Bypass) - Browser Memory Leak through Javascript Engine	CWE: 200 CVE: 2017-5753 BID: 102371	This strike exploits the Spectre vulnerability identified in modern Intel CPUs by leveraging a side-channel attack through the Javascript engine within a browser. This vulnerability is due to incomplete clearance of CPU cache memory after invalidation of a speculative execution result. By exploiting this vulnerability, an attacker can obtain sensitive data, like stored passwords or session IDs, from the browser's process memory.
Strike HPE Intelligent Management Center UrlAccessController Authentication Bypass	CWE: 287 CVE: 2017-5791	This strike exploits an authentication bypass vulnerability in HPE Intelligent Management Center. This vulnerability is due to doFilter method which contains multiple ways to bypass authentication if the URI contains specific strings. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target system. Successful exploitation allows to bypass authentication requirements, which can be leveraged to execute arbitrary code in the context of SYSTEM.
Strike HPE Intelligent Management Center Remote Unauthenticated filePath parameter Information Disclosure	CWE: 200 CVE: 2017-5797 BID: 97214	This strike exploits an information disclosure vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center (IMC). Specifically, an authentication check is not made when processing HTTP requests sent to the URI / servicedesk/servicedesk/fileDownload. An unauthenticated attacker can specify a file and path as the value of the filePath parameter to disclose contents on the remote machine.
Strike HPE Network Automation RedirectServlet SQL Injection	CWE: 89 CVE: 2017-5810 BID: 98331	This strike exploits an SQL injection vulnerability in HPE Network Automation. The RedirectServlet constructs SQL queries in order to retrieve information from the database, and does not allow specific characters to be passed in these parameters. However, a malicious attacker can construct a query using the deviceID parameter that will perform an SQL UNION and return an encryption key from the database in the primaryIPAddress parameter. When combined with the authentication bypass this attack can lead to SQL command execution in the remote database.
Strike HPE Network Automation FileServlet Information Disclosure	CWE: 200 CVE: 2017-5811 BID: 98331	This strike exploits an information disclosure vulnerability in HPE Network Automation. Specifically the FileServlet class fails to properly validate the encrypted file path provided by the user. A malicious attacker can craft a request via the tk parameter that will allow for file contents to be disclosed. This attack can be combined with an SQL injection (CVE-2017-5810) to provide the key used for encryption and decryption

Name	References	Description
Strike HPE Network Automation PermissionFilter Authentication Bypass	CWE: 89 CVE: 2017-5812 BID: 98331	This strike exploits an authentication bypass vulnerability in HPE Network Automation. The PermissionFilter class performs a check to determine if a URI request requires authentication. However, if traversal characters are used in conjunction with these strings an attacker can bypass authentication to allow access to the requested page.
Strike NetGear DGN2200 Devices ping.cgi Remote Code Execution	CVE: 2017-6077 CWE: 78	This strike exploits an command injection vulnerability in NetGear DGN2200 Devices. The vulnerability is due to improper input validation of parameters used in ping.cgi component on NetGear DGN2200 devices. A remote, authenticated attacker could exploit this vulnerability by sending a crafted HTTP request and might result in remote code execution in the context of running service.
Strike D-Link Directory Traversal Information Disclosure	CWE: 22 CVE: 2017-6190 EXPLOITDB : 41840 BID: 97620	This strike exploits a directory traversal vulnerability present in multiple firmware versions of D-Link routers. The vulnerability can be exploited by performing GET requests under the path '/uir' of router's web interface. By exploiting it, an attacker may read arbitrary files from the filesystem which could lead further to credentials disclosure.
Strike Symantec Messaging Gateway performRestore Command Injection	CWE: 20 CVE: 2017-6327	This strike exploits a command injection vulnerability in Symantec Messaging Gateway. The vulnerability is due to authentication bypass in the 'LoginAction' and improper validation of input passed to 'performRestore' method. Specifically, the 'localBackupFileSelection' parameter is not properly sanitized. The flaw may be exploited by an unauthenticated attacker to execute arbitrary code in the context of the root user.
Strike NETGEAR DGN2200 Devices OS Command Injection Vulnerability	CVE: 2017-6334 CWE: 78	This strike exploits an OS command injection vulnerability on NETGEAR DGN2200 routers. The vulnerability is due improper input validation in user-supplied input , allowing shell metacharacters in the host_name field of an HTTP POST request in dnslookup.cgi script. A remote authenticated attacker can exploit this by sending a crafted POST request with valid login details. Successful exploitation could allow the attacker to execute arbitrary OS commands on the device.
Strike Cisco Prime Collaboration Provisioning ScriptMgr BeanShell Authentication Bypass	CWE: 862 CVE: 2017-6622 BID: 98520	This strike exploits an authentication bypass vulnerability in Cisco Prime Collaboration Provisioning ScriptMgr servlet. The ScriptMgr servlet is intended to allow authenticated users to access BeanShell, which can execute Java and Javascript code with root privileges. However, it only authenticates HTTP GET and POST requests. Other HTTP requests, such as HEAD, are processed without authentication. An attacker can send an HTTP request other than GET or POST to the vulnerable servlet to achieve execution of arbitrary Java or Javascript code with root privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Zyxel EMG2926 diagnostic tools OS Command Injection	CWE: 78  CVE: 2017-6884  EXPLOITDB : 41782	This strike exploits a command injection vulnerability in Zyxel EMG2926 home router. The vulnerability is due to improper validation of input passed to 'nslookup' function located in the diagnostic tools. By exploiting this vulnerability, a remote unauthenticated attacker can execute arbitrary OS commands on the target router.
Strike Horde Webmail OS Command Injection	CWE: 78  CVE: 2017-7413	The strike exploits an OS command injection vulnerability in Horde Groupware Webmail client. The vulnerability originates from the lack of sanitization in handling the 'generate_email' parameter when generating PGP keys. The parameter will be later passed as a command line argument to the 'gpg' binary, allowing arbitrary commands execution on the host system.
Strike MXview Industrial Network Management Software Information Disclosure	CWE: 200  CVE: 2017-7455  EXPLOITDB : 41850	This strike exploits an information disclosure vulnerability in MXview Industrial Network Management Software. The vulnerability is due to lack of access controls and improper handling of HTTP requests. Successful exploitation will allow an attacker to obtain sensitive information from the server, including SSL private key.
Strike Mantis Bug Tracker Password Reset Vulnerability	CWE: 640  CVE: 2017-7615  BID: 97707	This strike exploits a remote password reset vulnerability in Mantis Bug Tracker. The vulnerability is due to improper input validation when checking password reset requests. A remote attacker can reset the password via an empty confirm_hash value to verify.php.
Strike Apache HTTP Server Token Out of Bounds Read	CWE: 20  CVE: 2017-7668  BID: 99137	This strike exploits a denial of service vulnerability in Apache HTTP Server. The vulnerability is due to an out-of-bounds that read exists in Apache when handling HTTP request with a malicious connection header field. By maliciously crafting a sequence of request headers, an attacker may be able to cause a DoS attack.
Strike PHP gdImageCreateFrom GifCtx Out Of Bound Read	CWE: 200  CVE: 2017-7890  BID: 99492	This strike exploits a PHP information disclosure vulnerability before version 5.6.31 and 7.x before 7.1.7 . This vulnerability is due to improper handling of objects in memory under GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c file. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted image file to the target server. Successful exploitation results in information disclosure.
Strike Schneider Umotion Builder localize SQL Injection	CWE: 89  CVE: 2017-7973  BID: 99344	This strike exploits a SQL injection in Schneider Electric U.motion Builder. The vulnerability is due to improper sanitization of user supplied input in username parameter. By exploiting this vulnerability, an attacker can execute arbitrary SQL queries on the server.

Name	References	Description
Strike Schneider Umotion Builder Runscript Path Traversal	CWE: 22 CVE: 2017-7974 BID: 99344	This strike exploits a Path Traversal vulnerability in Schneider Electric U.motion Builder. The vulnerability is due to improper sanitization of user supplied input in s parameter. By exploiting this vulnerability, an attacker can read sensitive information on the server.
Strike Exponent CMS eaasController php api Function SQL Injection	CWE: 89 CVE: 2017-7991	This strike exploits an SQL injection vulnerability in Exponent CMS. The vulnerability is due to a lack of input validation on the apikey HTTP parameter by the api() function. A remote, unauthenticated user can exploit this vulnerability by sending a crafted HTTP request to the affected page. Successful exploitation could result in the execution of arbitrary SQL commands on the target server.
Strike EMC Data Protection Advisor Application Service Static Credentials Authentication Bypass	CWE: 798 CVE: 2017-8013	This strike exploits a static credentials authentication bypass vulnerability in the EMC Data Protection Advisor Application service. This vulnerability is due to hard-coded hidden user entries within the application database. A remote, unauthenticated attacker could exploit this vulnerability by sending a specially crafted request with one of the undocumented credentials in the Authorization header. Successful exploitation would allow attacker to bypass authentication under the context of the Administrator.
Strike Microsoft Edge AsmJsInterpreter Method Use After Free	CWE: 119 CVE: 2017-8603 BID: 99406	This strike exploits a use after free vulnerability in the Microsoft Edge Browser. Specifically, the vulnerability exists in the AsmJsInterpreter method in the Javascript Chakra engine in Microsoft Edge. When creating an asm function with a template literal an object that gets created and freed is later referenced, triggering a use after free condition. An attacker could craft code in such a way that would cause a denial of service condition in the browser or potentially allow for remote code execution to occur.
Strike Microsoft Edge Chakra Uninitialized Arguments	CWE: 119 CVE: 2017-8640 BID: 100051 GOOGLE: 1297 EXPLOITDB : 42476	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. Javascript can be crafted in such a way that allows for the function argument object to be uninitialized. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra Javascript Engine EvalHelper Argument Length Integer Overflow	CWE: 119 CVE: 2017-8641 BID: 100057 EXPLOITDB : 42465	This strike exploits an Integer Overflow vulnerability in the Microsoft Edge Browser. Specifically, the vulnerability exists when the eval method is called with an overly large string value as the argument. An attacker could craft code in such a way that would cause a denial of service condition in the browser or potentially allow for remote code execution to occur.

Name	References	Description
Strike Microsoft Edge Chakra ProcessLinkFailedAsmJsModule Incorrect Reparse	CWE: 119 CVE: 2017-8645 BID: 100052 GOOGLE: 1271 EXPLOITDB : 42469	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. If the Javascript engine cannot link the asmjs module it gets treated as a normal function, however, when this code is reparsed certain cases are not correctly handled, which can result in binding incorrect information to the constructor. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Destructuring Assignment Argument Uninitialized Variable Use	CWE: 119 CVE: 2017-8656 BID: 100033 EXPLOITDB : 42464 GOOGLE: 1266	This strike exploits a vulnerability in Microsoft Edge's Javascript Chakra engine. Specifically, there exists a case where a destructuring assignment is passed as an argument to the catch statement, and the variable inside does not get properly initialized. This use of uninitialized memory when the variable is referenced later may result in a denial of service in the browser or potentially lead to remote code execution.
Strike Microsoft Edge Chakra Uninitialized arguments Object	CWE: 119 CVE: 2017-8670 BID: 100070 GOOGLE: 1298 EXPLOITDB : 42477	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the javascript Chakra engine. Javascript can be crafted in such a way that allows for the function argument object to be uninitialized. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra Engine JavascriptFunction EntryCall Mishandles CallInfo	CWE: 119 CVE: 2017-8671 BID: 100071 EXPLOITDB : 42475 GOOGLE: 1295	This strike exploits a vulnerability in Microsoft Edge's Javascript Chakra engine. The Chakra engine uses the args.Info.Count - 1 as the length of the arguments when given. So this value must be 1 or greater. However, a condition exists in the Chakra Javascript engine where the args.Info.Count can be decremented to 0. This may result in a denial of service in the browser or potentially lead to remote code execution.

Name	References	Description
Strike Microsoft Edge Chakra ConvertObjectToObjectPattern Type Confusion	BID: 100733  CWE: 119  CVE: 2017-8729  GOOGLE: 1308  EXPLOITDB : 42763	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that the ConvertObjectToObjectPattern method will contain incorrect members. When one of these members is referenced type confusion will occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge COptionsCollectionCacheItem Out of Bounds Memory Read	CWE: 119  CVE: 2017-8734  BID: 100738  EXPLOITDB : 42759	This strike exploits a vulnerability in Microsoft Edge. Specifically, the vulnerability exists within edgehtml's COptionsCollectionCacheItem::GetAt function. When parsing html textarea, select, and optgroup elements, it is possible to create an out of bounds read condition that allows for the reading of heap buffer memory. This can cause a denial of service or potentially lead to remote code execution.
Strike Microsoft Edge Chakra Object.setPrototypeOf Of Memory Corruption	CWE: 119  CVE: 2017-8751  GOOGLE: 1339  EXPLOITDB : 43151	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. Javascript can be crafted in such a way that allows for memory corruption to occur when a call to setPrototypeOf is made. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Joomla com_fields SQL Injection	CWE: 89  CVE: 2017-8917  BID: 98515  EXPLOITDB : 42033	This strike exploits an SQL injection vulnerability in Joomla! 3.7. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure, database corruption, denial of service and others.
Strike HPE Intelligent Management Center flexFileUpload Arbitrary File Upload	CWE: 22  CVE: 2017-8961	This strike exploits an arbitrary file upload vulnerability in Hewlett Packard Enterprise (HPE) Intelligent Management Center. By design, the uri /imc/flexFileUpload should accept xml documents in multipart/form-data encoding. However, file extension and type are not validated, allowing for arbitrary file upload. An attacker can send specially crafted HTTP POST requests containing an arbitrary file with multipart/form-data to upload the file. If the file is of type .jsp or .jspx, the attacker can then request the file to achieve arbitrary code execution with SYSTEM privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HPE Intelligent Management Center perfAccessMgrServl et Insecure Java Deserialization	CWE: 502 CVE: 2017-8962	This strike exploits an insecure java deserialization in Hewlett Packard Enterprise (HPE) Intelligent Management Center (IMC). This vulnerability is due to improper validation of Java serialized objects before deserialization . An attacker could send a specially crafted HTTP POST request to achieve arbitrary command execution with either SYSTEM or root privileges.
Strike HPE Moonshot Provisioning Manager Appliance Directory Traversal	CWE: 20 CVE: 2017-8977	This strike exploits a directory traversal vulnerability in the HPE Moonshot Provisioning Manager Appliance. The vulnerability is due to inadequate authentication and input validation in the server_response.py script. A remote, unauthenticated attacker can exploit this vulnerability by sending requests with crafted filenames containing directory traversal patterns. Successful exploitation enables attackers to overwrite arbitrary files accessible to the web application, potentially leading to a denial-of-service condition.
Strike Apache httpd mod_auth_digest Memory Access Denial of Service	CWE: 200 CVE: 2017-9788	This strike exploits a memory access error in Apache httpd. The value placeholder in Proxy-Authorization or Authorization headers of type 'Digest' is not initialized or reset by mod_auth_digest. A remote, unauthenticated attacker could exploit this vulnerability by sending an initial key with no '=' assignment which could reflect the stale value of uninitialized pool memory used by the prior request, leading to leakage of potentially confidential information, and a segfault in other cases resulting in denial of service.
Strike Apache Struts2 Plugin OGNL Command Execution	CWE: 20 CVE: 2017-9791 BID: 99484	This strike exploits a remote command execution vulnerability in the Struts 1 plugin in Apache Struts 2.3.x. When using the Struts 1 plugin in Struts 2, and the Struts 1 action and value are part of a message presented to the user, it is possible for an attacker to craft a malicious field value that may allow for remote code execution to occur.
Strike Apache Struts2 REST Plugin XStream DoS	CWE: 20 CVE: 2017-9793 BID: 100611	This strike exploits a denial of service vulnerability in Apache Struts2 REST plugin. Attacker can send a crafted XML file to cause the application server to terminate. Apache Struts 2.3.7 through 2.3.33, and 2.5 through 2.5.12 are vulnerable.
Strike Apache Struts REST plugin with XStream handler Command Execution	CWE: 502 CVE: 2017-9805 BID: 100609	This strike exploits a remote command execution vulnerability in Apache Struts. The vulnerability is due to insecure deserialization of data by XStreamHandler in Apache Struts REST Plugin. Successful exploitation may result in executing arbitrary code on the target system.
Strike PHPUnit Command Injection	CWE: 94 CVE: 2017-9841	This strike exploits a command injection vulnerability in PHPUnit. This vulnerability lies within the /phpunit/src/Util/PHP/eval-stdin.php file through its use of the php://input wrapper. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted post request to the target server. Successfully exploiting this vulnerability could result in arbitrary PHP code execution on the target system.

Name	References	Description
Strike Cisco ASA SSL VPN XML Packet Memory Corruption	CWE: 415 CVE: 2018-0101 BID: 102845 EXPLOITDB : 43986	This strike exploits a double-free memory corruption vulnerability in Cisco ASA. The vulnerability is due to failure to parse invalid XML data. By sending a crafted SSL packet containing invalid XML, a remote, unauthenticated attacker could execute arbitrary code on the targeted device.
Strike Cisco Adaptive Security Appliance - Path Traversal	CWE: 20 CVE: 2018-0296 EXPLOITDB : 44956 BID: 104612	This strike exploits a vulnerability of the Cisco Adaptive Security Appliance (ASA) web interface. The vulnerability is due to improper input validation of the HTTP URL. An attacker could exploit this vulnerability by sending a specially-crafted HTTP request to the target device. A successful exploit could allow the attacker to cause a DoS condition or unauthenticated disclosure of information.
Strike H2O Webserver HTTP Headers Buffer Overflow	CWE: 119 CVE: 2018-0608	This strike exploits a heap buffer overflow vulnerability in H2O Webserver. H2O Webserver has a function to allocate sufficient memory for large HTTP headers, however, in certain cases the buffer position pointer may become negative or overly large. In this case, the buffer will not be reallocated, leading to a buffer overflow. An attacker can exploit this vulnerability by sending a specially crafted HTTP message. Successful exploitation may result in arbitrary code execution or abnormal termination of the H2O Webserver, leading to a denial of service condition.
Strike Microsoft Edge Chakra Incorrect Bounds Check	CWE: 119 CVE: 2018-0769 GOOGLE: 1390 EXPLOITDB : 43710 BID: 102396	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that will allow for an integer overflow to occur because a bounds check is calculated incorrectly when the code is JITed. This may lead to a denial of service condition in the browser, or potentially remote code execution.

Name	References	Description
Strike Microsoft Edge Chakra Deferred Parsing Wrong Scope	CWE: 119 CVE: 2018-0775 GOOGLE: 1412 EXPLOITDB : 43717 BID: 102400	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that the DeferParse flag causes an incorrect opcode to be generated, which changes the function expression's scope. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra ASM EmitCall Type Confusion	CWE: 200 CVE: 2018-0780 BID: 102389 GOOGLE: 1433 EXPLOITDB : 43720	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the javascript Chakra engine. The ASM EmitCall function does not properly handle invalid function calls and this can lead to an out of bounds read. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra InitProto Type Confusion	CWE: 119 CVE: 2018-0834 GOOGLE: 1455 EXPLOITDB : 44078 BID: 102859	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in Javascript Chakra engine. It is possible to craft Javascript in such a way that when optimizing InitProto instructions type confusion will occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra NewScObjectNoCtor Array Type Confusion	CWE: 119 CVE: 2018-0838 GOOGLE: 1463 EXPLOITDB : 44080 BID: 102877	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that when NewScObjectNoCtor is used to set a new object's __proto__ type confusion can occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.

Name	References	Description
Strike Microsoft Internet Explorer String.lastIndexOf Use After Free	GOOGLE: 1453 CWE: 119 CVE: 2018-0866 BID: 103032 EXPLOITDB : 44153	This strike exploits a vulnerability in the Microsoft Internet Explorer browser. Specifically the vulnerability exists within the Javascript engine. An attacker can craft Javascript in such a way that when invoking the lastIndexOf method on String a Use After Free can occur potentially resulting in memory disclosure. This can lead to a denial of service condition in the browser or potentially remote code execution.
Strike Microsoft Edge Chakra Stack to Heap Copy Fix Bypass	CWE: 119 CVE: 2018-0933 GOOGLE: 1502 EXPLOITDB : 44396 BID: 103274	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that bypasses the fix for a stack to heap copy by adding a line that allocates "head" to the heap. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Internet Explorer jscript.dll Use-After-Free	CWE: 119 CVE: 2018-0935 BID: 103298 EXPLOITDB : 44404	This strike exploits a vulnerability in the Microsoft Internet Explorer browser. The vulnerability lies within jscript.dll. A HTML page containing Javascript can be crafted in such a way that allows for a heap buffer overflow. Successful exploitation may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Edge Chakra Magic Value Type Confusion	CWE: 119 CVE: 2018-0953 GOOGLE: 1531 EXPLOITDB : 44694 BID: 103990	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that the JITed code does not check the input value, which can lead to type confusion. This may lead to a denial of service condition in the browser, or potentially remote code execution.

Name	References	Description
Strike Microsoft Edge Chakra Bounds Check Bypass	CWE: 119 CVE: 2018-0980 GOOGLE: 1530 EXPLOITDB : 44653 BID: 103626	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that it is possible to incorrectly remove a bounds check. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Electron Protocol Handler Command Injection	CWE: 78 CVE: 2018-10000 06 BID: 102796 EXPLOITDB : 43899	This strike exploits a remote command injection vulnerability in GitHub Electron versions 1.8.2-beta.3 and earlier, 1.7.10 and earlier, 1.6.15 and earlier. The vulnerability is due to insufficient validation of whether additional command line arguments were specified via the URI. This vulnerability could allow an unauthorized user to execute arbitrary code on the server.
Strike OpenEMR edit_globals Remote Command Execution	CWE: 78 CVE: 2018-10000 19 EXPLOITDB : 45161	This strike exploits a command injection vulnerability in OpenEMR. The vulnerability is due to improper validation of input passed to 'edit_globals.php' script. By exploiting this vulnerability, a remote authenticated attacker can execute arbitrary OS commands on the target router.
Strike Squid Proxy Server ESI Null Pointer Dereference	CWE: 476 CVE: 2018-10000 27	This strike exploits a null pointer dereference vulnerability in Squid Proxy Server. Due to an implementation error, a null pointer dereference occurs when Squid attempts to fetch HTML fragments from esi:include elements. This dereference results in a segmentation fault, leading to abnormal termination of the Squid process.
Strike Modx Revolution phpthumb Remote Code Execution	CWE: 732 CVE: 2018-10002 07	This strike exploits a remote code execution vulnerability found in Modx Revolution CMS. The vulnerability is due to improper input validation while processing parameters before passing them into 'phpthumb' class. An attacker could exploit this vulnerability by crafting a special HTML POST request that can create a file with custom a filename and content. This can result in execution of arbitrary commands under the privileges of web server daemon user.

Name	References	Description
Strike GitList searchTree method Remote Code Execution	CWE: 20 CVE: 2018-10005 33 EXPLOITDB : 44993	This strike exploits a parameter injection vulnerability found in klaussilveira GitList. The vulnerability is due to insufficient validation of input supplied to php function 'escapeshellarg' within searchTree form. Remote attackers can exploit this vulnerability by crafting a malicious HTTP POST request, ultimately gaining code execution on the target system.
Strike Jenkins Remote Code Execution	CWE: 502 CVE: 2018-10008 61 BID: 106176	This strike exploits a remote code execution vulnerability in Jenkins. The vulnerability is due to improper filtering of the "value" parameter when invoking a method on Java objects. An attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in remote code execution on the target server.
Strike Dolibarr carte.php Reflected XSS	CWE: 79 CVE: 2018-10095	This strike exploits a reflected cross-site scripting vulnerability found in Dolibarr CRM. This vulnerability is due to inadequate input filtering in the web interface, while parsing input passed to foruserlogin parameter within adherents/cartes/carte.php. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike Trend Micro Endpoint Application Control FileDrop Directory Traversal	CWE: 22 CVE: 2018-10357	This strike exploits a directory traversal vulnerability in the management console of Trend Micro Endpoint Application Control. The vulnerability is due to insufficient validation of filenames in the filename parameter of the Content-Disposition header in multipart/form-data requests sent to FileDropService. A remote, authenticated user can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation could result in the execution of arbitrary code as the SYSTEM user.
Strike Dasan GPON Home Router GponForm dest_host OS Injection	CWE: 78 CVE: 2018-10562 EXPLOITDB : 44576	An arbitrary file overwrite vulnerability has been identified in Dasan GPON Home Router. The vulnerability is caused by the lack of proper input sanitisation of 'dest_host' parameter within the 'GponForm'. The vulnerability can be exploited by sending a specially-crafted POST request, allowing the attacker to execute arbitrary commands on the device with root privileges.
Strike ProjectPier Remote File Inclusion	CWE: 89 CVE: 2018-10759	This strike exploits a remote file inclusion vulnerability in ProjectPier. The vulnerability is due to improper sanitization of "id" parameter in requests to patch.php script. By exploiting this vulnerability, a remote, unauthenticated attacker could execute arbitrary commands or SQL statements. Note: When run in one-arm mode, this strike will retrieve a malicious sql file from an attacker-controlled web server ( <a href="http://172.16.2.210:8000/mal">http://172.16.2.210:8000/mal</a> ) and execute it on the target.

Name	References	Description
Strike WordPress Plugin Pie Register Blind SQL Injection	CWE: 89 CVE: 2018-10969 EXPLOITDB : 44867	This Strike exploits a blind SQL injection in WordPress Pie Register plugin. The vulnerability is due to insufficient user input sanitization passed to order parameter. A specially crafted HTTP GET request can cause a SQLi in the context of the database user.
Strike Quest KACE System Management Appliance Remote Code Execution	CWE: 78 CVE: 2018-11138	This strike exploits a critical command injection vulnerability within the Quest KACE System Management Appliance. The vulnerability arises from the /common/download_agent_installer.php script's inadequate sanitization of user-supplied input. Specifically, arises due to the the script fails to properly to properly neutralize special elements used in operating system commands, allowing an attacker to inject arbitrary commands. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the vulnerable endpoint, potentially leading to remote code execution.
Strike Moodle CMS questiontype.php Answer Remote Code Execution	CWE: 74 CVE: 2018-1133 EXPLOITDB : 46551 BID: 104307	The strike reproduces a remote code execution attack on Moodle CMS platform. The vulnerability resides in poor user input sanitization for 'answer' parameter within 'questiontype.php', when defining a new quizz of type 'Calculated'. By exploiting the issue, a remote authenticated attacker may execute arbitrary PHP code with HTTP Server privileges.
Strike AXONPBX Web interface Auto-Dialer Agents reflected Cross Site Scripting	CWE: 79 CVE: 2018-11552	This strike exploits a reflected cross-site scripting vulnerability found in AXONPBX Web interface. This vulnerability is due to inadequate input filtering in the web interface, while parsing input passed to name parameter within Auto-Dialer Agents form. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike Quest Appliance - NetVault Backup Stack Buffer Overflow	CWE: 20 CVE: 2018-1161	A stack buffer overflow has been identified in Quest NetVault Backup appliance. The vulnerability is caused by the lack of proper input sanitisation in the context of multipart HTTP requests processing. The vulnerability can be exploited by accessing the Web Interface of the NetVault server via a specially-crafted HTTP POST request, allowing the attacker arbitrary code execution with SYSTEM privileges.
Strike Quest Appliance - NetVault Backup Arbitrary File Overwrite	CVE: 2018-1162	An arbitrary file overwrite vulnerability has been identified in Quest NetVault Backup appliance. The vulnerability is caused by the lack of user input sanitisation in the context of log exportation. The vulnerability can be exploited by accessing the Web Interface of the NetVault server via a specially-crafted HTTP POST request, allowing the attacker to overwrite any file with SYSTEM privileges.
Strike Quest NetVault Backup Checksession Authentication Bypass	CVE: 2018-1163	This strike exploits an authentication bypass vulnerability in Quest NetVault Backup. The vulnerability is due to insufficient validation of the checksession parameter in multipart HTTP requests. Successful exploitation may result in successful bypass of the authentication mechanism.

Name	References	Description
Strike Ignite Realtime Openfire Reflected Cross Site Scripting	CWE: 79 CVE: 2018-11688	This strike exploits a reflected cross-site scripting vulnerability found in Ignite Realtime Openfire Web interface. This vulnerability is due to inadequate input filtering in the web interface, while parsing input passed to 'url' parameter within login.jsp form. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike Joomla! CMS Gridbox extension Reflected Cross-Site Scripting	CWE: 79 CVE: 2018-11690	This strike exploits a cross-site scripting vulnerability in Joomla! CMS equipped with Gridbox extension. This vulnerability is due to inadequate input filtering in the web interface, while parsing the input from 'app' and 'category' parameters. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser or stole the victim's cookie.
Strike Squid Proxy ESI and OpenSSL Configuration Denial of Service	CWE: 476 CVE: 2018-1172	This strike exploits a code execution vulnerability in Squid Proxy. The vulnerability is due to improper handling of objects in memory within the ESI and OpenSSL functionalities of the server. By sending a crafted ESI responses to the target server, the attacker can cause denial-of-service conditions on the target proxy service.
Strike Apache Tomcat mod_jk JK Status Manager Access Bypass	CWE: 22 CVE: 2018-11759 BID: 105888	This strike exploits an access bypass vulnerability in Apache Tomcat JK Status Manager. By inserting a semicolon after the jkstatus uri, access restrictions are bypassed. An attacker could send specially crafted HTTP GET requests to change ports, resulting in a denial of service condition, or to disclose information about the target server.
Strike Dell EMC VMAX Virtual Appliance Manager Authentication Bypass	CWE: 798 CVE: 2018-1216 BID: 103039	This strike exploits an authentication bypass on Dell EMC VMAX Virtual Appliance Manager. This vulnerability is due to improper use of an account "smc" which is not documented. A remote attacker can exploit this vulnerability by sending hardcoded account and password to the system. Successful exploitation results in authentication bypass on target server.
Strike Mozilla Firefox Javascript Array.Prototype.Push Information Disclosure	CWE: 20 CVE: 2018-12387 BID: 105460	This strike exploits an information disclosure vulnerability in the Mozilla Firefox browser. Specifically, the JavaScript JIT compiler inlines Array.prototype.push with multiple arguments that result in the stack pointer being off by 8 bytes. When this occurs a memory address gets leaked that can be used as part of an exploit. This strike demonstrates the information disclosure by dumping the leaked memory addresses.
Strike iCMS v7.0.8 admincp.php SQL Injection	CWE: 89 CVE: 2018-12498	This strike exploits an Time-Based SQL injection vulnerability in iCMS v7.0.8. The vulnerability is caused by insufficient validation of user input on HTTP requests which are used to create SQL queries. Successful exploitation could allow an attacker to trigger a denial-of-service on the target server for a short period.

Name	References	Description
Strike phpMyAdmin 4.8.1 File Inclusion	CWE: 287 CVE: 2018-12613 EXPLOITDB : 44924 BID: 104532	This strike exploits a file inclusion vulnerability in phpmyadmin 4.8.1. The vulnerability is caused by insufficient validation of user input on HTTP requests which are used to create file include queries. Successful exploitation could allow an attacker to have read/execute access on the target server.
Strike WordPress Plugin iThemes Security SQL Injection	CWE: 89 CVE: 2018-12636 EXPLOITDB : 44943	This Strike exploits a blind SQL injection in WordPress iThemes Security plugin. The vulnerability is due to insufficient user input sanitization passed to 'orderby' parameter. A specially crafted HTTP GET request can cause a SQLi in the context of the database user.
Strike Spring Data Commons Remote Code Execution	CWE: 20 CVE: 2018-1273 BID: 100948	This strike exploits a remote code execution vulnerability in Pivotal Spring Data Commons. The vulnerability is due to a SPEL injection in SimpleEvaluationContext method. Successful exploitation can result in arbitrary code execution in the context of Spring Data Commons.
Strike iCMS v7.0.8 article.admincp.php SQL Injection	CVE: 2018-12888	This strike exploits a Time-Based SQL injection vulnerability in iCMS v7.0.8. The vulnerability is caused by insufficient validation of user input, app=article, on HTTP requests, which are used to create SQL queries. Successful exploitation could allow an attacker to trigger a denial-of-service on the target server for a short period.
Strike WordPress Core Authenticated Directory Traversal	CWE: 22 CVE: 2018-12895 BID: 104569	The strike exploits an authenticated directory traversal vulnerability in WordPress platform. The vulnerability is due to the lack of sanitization of the 'thumb' POST parameter while handling media files metadata within 'post.php', and can be exploited by any account with edit rights. As a consequence, an attacker may delete arbitrary files within the file system which can be leveraged to code execution by changing the platform's configuration.
Strike Zoho ManageEngine Desktop Central Arbitrary File Deletion	CWE: 20 CVE: 2018-12999	This strike exploits an arbitrary file deletion vulnerability in Zoho ManageEngine Desktop Central. The vulnerability is due to insufficient input validation in requests handled by AgentTrayIconServlet. The values of the HTTP parameters are extracted and concatenated to form the file path without any validation for directory traversal characters. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted message to the target server. Successful exploitation could result in the deletion of arbitrary files. This may lead to a denial of service condition if important executables and dynamic link libraries are deleted.

Name	References	Description
Strike Apache Pluto PortletV3Annotated Demo MultipartPortlet Arbitrary File Upload	CWE: 200 CVE: 2018-1306 EXPLOITDB : 45396	A file upload vulnerability was found in Apache Pluto PortletV3AnnotatedDemo. The vulnerability is due to improper access control of user-supplied input when the portlet performs a file-uploading operation. Successful exploitation can result arbitrary file upload and possible remote code execution in the context of the user running the webserver.
Strike TerraMaster NAS URL Reflected XSS	CWE: 79 CVE: 2018-13329	This strike exploits a vulnerability in the TerraMaster NAS device. This device allows for the attacker to inject Javascript in the URL because it does not properly validate pages that do not exist. It is possible for an attacker to perform a Reflected XSS attack by injecting javascript in the requested URL.
Strike TerraMaster NAS groupname Parameter System Command Injection	CWE: 78 CVE: 2018-13330	This strike exploits a vulnerability in the TerraMaster NAS device. This device allows for the option to pass command line arguments to the system during the creation of a user but does not properly validate the arguments passed via the groupname parameter. It is possible to execute system commands as a root user on a vulnerable device.
Strike TerraMaster NAS sysname Parameter HTML Injection	CWE: 79 CVE: 2018-13334	This strike exploits a vulnerability in the TerraMaster NAS device. This device allows for an attacker to execute a cross site scripting attack against the system by performing HTML injection via the sysname parameter. It is then possible to hijack the user session the vulnerable system.
Strike TerraMaster NAS Password System Command Injection	CWE: 78 CVE: 2018-13336	This strike exploits a vulnerability in the TerraMaster NAS device. This device allows for the option to pass command line arguments to the system during the creation of a user but does not properly validate the arguments passed via the password parameter. It is possible to execute system commands as a root user on a vulnerable device.
Strike TerraMaster NAS Username System Command Injection	CWE: 78 CVE: 2018-13338	This strike exploits a vulnerability in the TerraMaster NAS device. This device allows for the option to pass command line arguments to the system during the creation of a user but does not properly validate the arguments passed. It is possible to execute system commands as a root user on a vulnerable device.
Strike TerraMaster NAS checkName System Command Injection	CWE: 78 CVE: 2018-13358	This strike exploits a vulnerability in the TerraMaster NAS device. This device allows for the option to pass command line arguments to the system during the creation of a user but does not properly validate the arguments passed via the checkName parameter. It is possible to execute system commands as a root user on a vulnerable device.
Strike Apache Tika tika-server Remote Command Injection	CVE: 2018-1335 BID: 104001	This strike exploits a post-authentication remote code execution vulnerability found in Apache Tika Server. The vulnerability is due to improper input validation while processing HTTP headers from client requests. An attacker could exploit this vulnerability by crafting a special HTML request, resulting in execution of arbitrary commands under the privileges of the current user.

Name	References	Description
Strike Fortinet FortiOS SSL VPN Credentials Disclosure	CWE: 22 CVE: 2018-13379 EXPLOITDB : 47288 BID: 108693	This strike replicates a directory traversal attack on Fortinet FortiOS. The vulnerability resides in the '/remote/fgt_lang' endpoint and affects product versions 5.6.3 to 5.6.7 and 6.0.0 to 6.0.4. By exploiting this flaw, a remote unauthenticated attacker may take over the device and perform attacks such as DNS hijacks.
Strike Fortinet FortiOS and FortiProxy SSLVPN Web Portal Magic Improper Authorization	CVE: 2018-13382 CWE: 863	This strike exploits an improper authorization vulnerability in SSLVPN web portal of Fortinet FortiOS and FortiProxy. The vulnerability is due to improper authorization of the SSL VPN web portal component in FortiOS and FortiProxy. A remote, unauthenticated attacker could exploit this vulnerability by crafting a HTTP request containing a parameter called "magic" with the value "4tinet2095866". Successful exploitation could allow the attacker to modify the password of SSL VPN web portal in Fortinet FortiOS and FortiProxy.
Strike Xen Project XAPI Update Directory Traversal	CWE: 22 CVE: 2018-14007	This strike exploits a directory traversal vulnerability in the XAPI component of Xen. The vulnerability is due to insufficient handling of URL-encoded path components in requests sent to the pool update endpoint, used for supplying updates to other members of a resource pool. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation results in the disclosure of arbitrary file contents from the server, which may include the administrator token.
Strike SoftNAS Cloud OS Command Injection	CWE: 78 CVE: 2018-14417 BID: 104914	This strike exploits a remote code execution in SoftNAS Cloud. The vulnerability is caused by insufficient validation of 'recentVersion' parameter on HTTP requests. Successful exploitation could allow an attacker to trigger a remote command execution on the target server.
Strike Open-AudIT Community Store Cross Site Scripting	CWE: 79 CVE: 2018-14493 EXPLOITDB : 45160	This strike exploits a store cross-site scripting vulnerability in Open-AudIT Community 2.2.6. This vulnerability is due to improper http input filtering the parameter "groups". By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike ASUSWRT appGet.cgi OS Command Injection	CVE: 2018-14714	A command injection vulnerability exists in ASUSWRT firmware version 3.0.0.4.382.50624 and earlier. The flaw results from lack of user input validation for HTTP parameters on the 'appGet.cgi' path. By sending a crafted 'hook' parameter, a remote attacker may execute arbitrary OS commands as the 'root' user.

Name	References	Description
Strike Cgit web server path Parameter Directory Traversal	CWE: 22 CVE: 2018-14912 EXPLOITDB : 45148	This strike exploits a directory traversal vulnerability in cgit web server. The vulnerability is caused by insufficient validation of user input, path, on HTTP requests. Successful exploitation could allow an attacker to have arbitrary file accessible on target system.
Strike NUUO NVRmini Devices uploaddir OS Command Injection Vulnerability	CVE: 2018-14933 CWE: 78	This strike exploits an OS command injection vulnerability in NUUO NVRmini Devices. The vulnerability is due to improper input validation of parameters used in upgrade_handle.php on NUUO NVRmini devices. A remote, unauthenticated attacker could exploit this vulnerability by crafting a http request containing shell metacharacters in the uploaddir parameter for a writeuploaddir command. Successful exploitation could allow the attacker to perform remote code execution.
Strike OpenEMR manage_site_files Unrestricted File Upload	CWE: 434 CVE: 2018-15139	A file upload vulnerability was found in the OpenEMR. The vulnerability is caused by the lack of proper input sanitisation passed to the manage_site_files Web PHP form. Successful exploitation can result in arbitrary code execution in the context of the user running OpenEMR.
Strike Advantech WebAccess SCADA bwMainLeft.asp Cross-Site Scripting	CWE: 79 CVE: 2018-15707	An unauthenticated stored cross-site scripting vulnerability exists in Advantech WebAccess. The vulnerability resides within 'bwMainLeft.asp' and can be exploited by crafting a GET request containing a malicious 'pname' parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target browser.
Strike Nagios XI Snoopy magpie Remote Code Execution	CVE: 2018-15708	This strike exploits a remote code execution vulnerability in Nagios XI Snoopy component. The vulnerability resides in the lack of request sanitization when parsing the 'url' parameter within 'magpie_debug.php' file. By providing the '-o' flag within the parameter's value, an attacker is able to download a Php script from an arbitrary url and dump it to a publicly accessible path in order to execute commands on the target system.
Strike Nagios XI Unauthenticated Stored Cross-site Scripting	CWE: 79 CVE: 2018-15712	An unauthenticated stored cross-site scripting vulnerability exists in Nagios XI web interface. The vulnerability resides within 'api_tool.php' and can be exploited by crafting a GET request containing a malicious 'host' parameter. The parameter's value is then stored in bpi.conf and is later included in the web management interface. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target browser.
Strike Adobe ColdFusion CKEditor upload.cfm Directory Traversal	CWE: 20 CVE: 2018-15960 BID: 105317	This strike exploits a directory traversal vulnerability in Adobe ColdFusion CKEditor. The vulnerability is due to improper sanitization in the file upload.cfm. An attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could upload arbitrary files to the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe ColdFusion CKEditor upload.cfm Unrestricted File Upload	CWE: 434  CVE: 2018-15961	This strike exploits an unrestricted file upload vulnerability in Adobe ColdFusion CKEditor. The vulnerability is due to improper restrictions on the files uploaded by users. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could upload arbitrary files and execute them on the target server.
Strike WordPress Plugin Wechat Broadcast 1.2.0 Local File Inclusion	EXPLOITDB : 45438  CWE: 22  CVE: 2018-16283	This strike exploits a remote file inclusion vulnerability in WordPress Plugin Wechat Broadcast 1.2.0. The vulnerability is due to improper sanitization of the "url" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.
Strike WordPress Plugin Localize 1.0 Local File Inclusion POST	EXPLOITDB : 45439  CWE: 22  CVE: 2018-16299	This strike exploits a remote file inclusion vulnerability in WordPress Plugin Localize My Post 1.0. The vulnerability is due to improper sanitization of the "file" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.
Strike ManageEngine Desktop Central Search Cross Site Scripting	CWE: 79  CVE: 2018-16833	This strike exploits a cross site scripting vulnerability in ManageEngine's Desktop Central Platform. The vulnerability can be exploited by through malicious input passed via "q" parameter in the search field. By exploiting this flaw, an attacker obtains client-side Javascript code execution within victim's browser which can lead to information disclosure and credentials theft.
Strike LimeSurvey TCPDF phar Deserialization Remote Code Execution	CWE: 502  CVE: 2018-17057  EXPLOITDB : 46634	This strike exploits a remote code execution in LimeSurvey. The vulnerability resides in a PHP Phar deserialization within the 'TCPDF' component and can be exploited by uploading a malicious JPEG/Phar polyglot and exporting the survey that contains it. Exploiting this flaw requires authentication and results in remote code execution.
Strike MyBB Post Video Stored Cross Site Scripting	CWE: 79  CVE: 2018-17128	This strike exploits a stored cross site scripting vulnerability in MyBB platform. The vulnerability can be exploited by crafting a malicious video attachment when creating a new topic. By exploiting this flaw, an attacker obtains client-side Javascript code execution within victim's browser which can lead to information disclosure and credentials theft.
Strike ManageEngine OpManager Search Blind SQL Injection	CWE: 89  CVE: 2018-17243	This strike exploits a blind SQL injection vulnerability in ManageEngine's OpManager application. The vulnerability is present in the global search input field as a result of insufficient user input sanitization. Therefore, an attacker may be able to read arbitrary database records or even access system files, depending on the database's configuration.

Name	References	Description
Strike Elastic Search Server.js Local File Inclusion	CWE: 829 CVE: 2018-17246 BID: 106285	This strike exploits a remote file inclusion vulnerability in Elasticsearch Kibana. The vulnerability is due to improper sanitization of the "apis" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve javascript files from the target server. The other file format can be found in a log file on the target server.
Strike Joomla component Questions SQL Injection	CWE: 89 CVE: 2018-17377 EXPLOITDB : 45468	This strike exploits a SQL injection vulnerability in the Questions component for Joomla!. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this vulnerability by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike IBM Identity Governance and Intelligence SQL Injection	CWE: 89 CVE: 2018-1756 EXPLOITDB : 45392	This strike exploits a SQL injection vulnerability in IBM Security Identity Governance Virtual Appliance. The vulnerability is caused by insufficient validation of user input on HTTP requests which are used to create SQL queries. Successful exploitation could allow an attacker to have access of back-end database.
Strike Kubernetes Dashboard Authentication Bypass Information Disclosure	CVE: 2018-18264 CWE: 306	This strike exploits an information disclosure vulnerability in Kubernetes Dashboard. The vulnerability allows unauthorized access to the kubernetes-dashboard-certs secret object. When an HTTP GET request is sent to /api/v1/secret/kube-system/kubernetes-dashboard-certs, access to the kubernetes-dashboard-certs object is not restricted and the server responds with the TLS certificate and private key.
Strike CentOS Web Panel Authenticated OS Command Injection	CWE: 78 CVE: 2018-18322	This strike exploits a remote command execution in CentOS Web Panel. The vulnerability is due to lack of parameter sanitization when executing service-related operations, with the service name passed as a GET parameter. By exploiting this vulnerability, an authenticated attacker is able to execute system commands as a root user.
Strike Mozilla Firefox Custom Elements Object Write After Free	BID: 106781 CWE: 416 CVE: 2018-18500	This strike simulates the traffic caused by exploiting a vulnerability in the Mozilla Firefox browser. Specifically, the vulnerability exists in the 'Custom Elements' stream handler component of Firefox. When handling an HTML5 stream in concert with custom HTML elements, the stream parser object is freed while still in use, leading to a crash. An attacker can exploit this vulnerability by passing a malicious web page to the targeted browser.
Strike LAquis SCADA PAGINA TITULO HTTP Parameter Command Injection	CWE: 74 CVE: 2018-18992 BID: 106634	This strike exploits a command injection vulnerability in LAquis SCADA. The PAGINA parameter in HTTP requests to acompanhamentotela.lhtml and the TITULO parameter in requests to relatorioindividual.lhtml are not sanitized for command injection characters. An attacker can send a specially crafted HTTP GET or POST request to achieve command execution on the target machine.

Name	References	Description
Strike LAquis SCADA NOME HTTP Parameter Command Injection	CWE: 862 CVE: 2018-18996 BID: 106634	This strike exploits a command injection vulnerability in LAquis SCADA. The NOME parameter in HTTP requests to relatorionome.lhtml is not sanitized for command injection characters. An attacker can send a specially crafted HTTP GET or POST request to achieve command execution on the target machine.
Strike Webmin history Parameter Cross-Site-Scripting	CWE: 79 CVE: 2018-19191	This strike exploits a cross-site scripting vulnerability in Webmin. The vulnerability results from the lack of sanitization when displaying the POST parameter 'history' in '/shell/index.cgi'. A successful exploitation leads to arbitrary code execution in visitors' browsers or credentials theft.
Strike PHP-Proxy Local File Inclusion	CWE: 200 CVE: 2018-19246 EXPLOITDB : 45861	This strike simulates an exploitation of a local file inclusion vulnerability present in PHP Proxy. The vulnerability results from the lack of input sanitization when handling the 'q' parameter. By exploiting this flaw, an attacker could read arbitrary files from the server's file system.
Strike OpenMRS Webservices API XML Deserialization Remote Code Execution	CWE: 502 CVE: 2018-19276 EXPLOITDB : 46327	This strike exploits an insecure deserialization via XML payload in OpenMRS's Webservices API module. By exploiting the vulnerability, an unauthenticated attacker might be able to execute system commands in the context of the user running the webserver process.
Strike PHP imap Remote Command Injection	CWE: 78 CVE: 2018-19518	This strike exploits a remote code execution vulnerability in the PHP imap_open function on Ubuntu or Debian. This vulnerability is due to improper handling of the -oProxyCommand values when a client sends http traffic to the server which has some imap functionality. A remote attacker can exploit this vulnerability by sending crafted http requests to the target server. Successful exploitation results in remote code execution. *Note: Actual exploit depends on server config and other parameters, this exploit demonstrate an server with username, password and hostname parameters. Exploit is under hostname parameter.
Strike phpMyAdmin Local File Inclusion	CWE: 200 CVE: 2018-19968	This strike exploits a remote file inclusion vulnerability in phpMyAdmin. The vulnerability is due to an improper filter, and the ability to execute a SQL sentence. By successfully exploiting this vulnerability, a remote, authenticated attacker could retrieve arbitrary files from the target server.
Strike Jenkins getOrCreate Policy Bypass	CWE: 20 CVE: 2018-19990 01	The strike exploits a policy bypass vulnerability in Jenkins CI Server. This vulnerability is due to insufficient validation of login requests by the "getOrCreate" function. By abusing this flaw, an attacker could trigger the removal of the config.xml file from the Jenkins' root directory which results in granting administrator access to anonymous users.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Jenkins Accept-Language Header Directory Traversal	CWE: 20 CVE: 2018-19990 02	The strike exploits an authenticated directory traversal vulnerability in Jenkins CI Server. The vulnerable code resides within Stapler web framework used by Jenkins, and lacks input validation when processing the "Accept-Language" header. The header will be further used to include a language-specific resource by concatenating the header's content to the resource's path. By exploiting the vulnerability, an attacker could read arbitrary sensitive files from the file system.
Strike Zoho ManageEngine OpManager SQL Injection in getGraphData API	CVE: 2018-20173	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the getGraphData API due to insufficient validation of input parameters such as name, index, and policyName. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary SQL commands on the application's database, potentially compromising its integrity and security.
Strike LibreNMS addhost Remote Code Execution	CWE: 78 CVE: 2018-20434 EXPLOITDB : 47044	A remote code execution vulnerability exists in LibreNMS versions prior to 1.46. The vulnerability is a result of improper sanitization when parsing the 'community' HTTP request parameter within 'addhost.inc.php'. A successful attacker is thus able to send specially crafted HTTP requests that could lead to execution of arbitrary commands on the target server.
Strike Oracle WebLogic Server Remote Diagnosis Assistant rda_tfa_ref_date Command Injection	BID: 102640 CVE: 2018-2615	A command injection vulnerability was found in Oracle WebLogic Remote Diagnosis Assistant web interface. The vulnerability is due to improper user supplied sanitization, when input is supplied to the rda_tfa_ref_date menu command. The vulnerability can be exploited by sending a specially crafted HTTP request to the target server. Successful exploitation can result in arbitrary code execution in the context of the Administrator user.
Strike Oracle WebLogic Remote Diagnosis Assistant rda_tfa_hrs Command Injection	CWE: 78 CVE: 2018-2616	This strike exploits a command injection vulnerability in the web console of the Oracle WebLogic Remote Diagnosis Assistant. The vulnerability is due to improper input validation of HTTP parameter hrs_since menu command in the Java class OsUtils, the command string is not properly sanitized for command injection characters. A remote authenticated attacker can exploit this vulnerability by sending a crafted request to the target application. Successful exploitation could lead to arbitrary command execution on the target server with privileges of the Administrator user.
Strike Oracle Hospitality Simphony Directory Traversal	CVE: 2018-2636 BID: 102560 EXPLOITDB : 43960	This strike exploits a path traversal vulnerability in the ProcessDimeRequest module on the Oracle Hospitality Simphony application. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in the disclosure of arbitrary file contents from the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle WebLogic Server Fusion Middleware File Upload	CVE: 2018-2894	A file upload vulnerability was found in the Oracle WebLogic Server component of Oracle Fusion Middleware. The vulnerability is caused by the lack of proper input sanitisation of the Weblogic Web Service Test Page. Successful exploitation can result in arbitrary code execution in the context of the user running WebLogic.
Strike Trend Micro Control Manager sCloudService GetPassword SQL Injection	CWE: 89 CVE: 2018-3604	This strike exploits an SQL injection vulnerability in the Trend Micro Control Manager. The vulnerability is due to a lack of authentication for accessing the GetPoliciesOfProductType operation and a failure to sanitize the account parameter in the HTTP request. An external, unauthenticated attacker can leverage this vulnerability by sending a crafted HTTP request to the targeted server. Successfully exploiting this vulnerability may result in the execution of arbitrary SQL code within the context of the Network Service user.
Strike Trend Micro IMSVA Management Portal Authentication Bypass	CWE: 522 CVE: 2018-3609	This strike exploits an authentication bypass in Trend Micro InterScan Mail Security Virtual Appliance. The vulnerability is due to insufficient protection of a log file which is publicly accessible containing session credentials for authenticated users. A remote, unauthenticated attacker can exploit this vulnerability by accessing the diagnostic log and obtaining valid session IDs which can then be used to log in as the associated user without knowledge of the user's credentials, bypassing the standard authentication mechanisms. Successful exploitation results in the bypass of authentication for access to the administrative interface.
Strike TP-Link TL-R600VPN Directory Traversal Information Disclosure	CWE: 22 CVE: 2018-3949	This strike exploits a directory traversal vulnerability in TP-Link TL-R600VPN router. The vulnerability can be exploited by issuing GET requests to the '/help' path. Since the webserver runs with root privileges, an attacker may gain access to the contents of any file residing on the file system.
Strike Apple Safari WebKit WebCore jsElementScrollHeightGetter Use After Free	CWE: 416 CVE: 2018-4200 GOOGLE: 1525 BID: 103961 EXPLOITDB : 44566	This strike exploits a vulnerability in Apple Webkit JavaScriptCore. Specifically, a Use After Free occurs when the jsElementScrollHeightGetter function is invoked in a specific manner. When this happens a denial of service condition, or potentially remote code execution, may occur.

Name	References	Description
Strike Apple Webkit handleMenuItemSelected Use After Free	CWE: 416 CVE: 2018-4312 GOOGLE: 1603 EXPLOITDB : 45481	This strike exploits a vulnerability in Apple Safari Webkit. It is possible to craft javascript and html in such a way that when calling the handleMenuItemSelected method a use after free vulnerability will occur. This can lead to a denial of service condition in the browser, or potentially allow for remote code execution.
Strike Apple Safari Webkit updateReferencedText Use After Free	CWE: 416 CVE: 2018-4315 GOOGLE: 1604	This strike exploits a vulnerability in Apple Safari Webkit. Specifically, it is possible to craft Javascript in such a way that allows for a use-after-free vulnerability to occur when calling the updateReferencedText method. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Apple Safari WebKit handleIntrinsicCall Type Confusion	CWE: 119 CVE: 2018-4382 GOOGLE: 1656	This strike exploits a vulnerability in Apple Safari Webkit. Specifically the vulnerability exists in the ByteCodeParser::handleIntrinsicCall method. It is possible to craft Javascript in such a way that will cause type confusion to occur. This can lead to a denial of service or potentially allow for remote code execution to occur.
Strike Apple Safari WebKit hoistSloppyModeFunctionIfNecessary Improper Object Validation	CWE: 119 CVE: 2018-4386 GOOGLE: 1665	This strike exploits a vulnerability in Apple Safari Webkit. Specifically the vulnerability exists in the BytecodeGenerator::hoistSloppyModeFunctionIfNecessary method. It is possible to craft Javascript in such a way that allows for an object to be passed as the property variable directly as a string to the op_get_direct_pname handler without being properly validated. This can lead to a denial of service in the browser application or potentially allow for remote code execution to occur.
Strike Apple Safari WebKit JSPropertyNameEnumerator Type Confusion	CVE: 2018-4416 CWE: 119 GOOGLE: 1652	This strike exploits a vulnerability in Apple Webkit. Specifically, an attacker can craft JavaScript in such a way that when a for loop is executed and a JSPropertyNameEnumerator object is created, the structure IDs inside the JSPropertyNameEnumerator object can get reused after their parents have been freed leading to type confusion. This can potentially lead to a denial of service or allow for remote code execution in the context of the current running process.
Strike Apple Safari Webkit JIT Allows for Array Proxy Object in Prototype Chains	CWE: 119 CVE: 2018-4438	This strike exploits a vulnerability in Webkit. Specifically, it is possible to create an array having a Proxy object in the prototype chain. This may cause a denial of service condition in the browser or allow for remote code execution to occur.

Name	References	Description
Strike Apple Webkit shiftCountWithArray Storage Out of Bounds Read-Write	CWE: 119 CVE: 2018-4441 GOOGLE: 1685	This strike exploits a vulnerability in Apple Webkit. It is possible to craft Javascript in such a way that an Out of Bounds Read/Write can occur in shiftCountWithArrayStorage. This can cause memory corruption to occur leading to a denial of service in the browser or potentially lead to remote code execution.
Strike WebKit JSC AbstractValue Set Use After Free	CWE: 119 CVE: 2018-4443 EXPLOITDB : 46071	This strike exploits a vulnerability in Apple WebKit. Specifically, the vulnerability exists in the AbstractValue Set method. Javascript can be crafted in such a way that the attacker can write into the immutable butterfly of a Copy on Write array. This can lead to a use after free condition causing a denial of service or potentially lead to remote code execution.
Strike Mozilla Firefox WebAssembly Table Object Integer Underflow	BID: 102786 CWE: 119 CVE: 2018-5093	This strike exploits a vulnerability in the Mozilla Firefox browser. Specifically, the vulnerability exists in the WebAssembly component of Firefox. When handling a table object, the get and set methods are not properly validated. It is possible for a user to provide a value to the index argument of one of these methods to access random memory in the heap buffer of where this table object is stored. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Advantech WebAccess Node chkLogin SQL Injection	BID: 102781 CWE: 89 CVE: 2018-5443	This strike exploits a SQL injection vulnerability in Advantech WebAccess Node. The vulnerability is due to lack of proper validation of user-supplied data used to construct SQL queries. A specially crafted HTTP request could allow the attacker to access and modify sensitive information within the SQL database.
Strike Advantech WebAccess SCADA certUpdate.asp Directory Traversal	BID: 102781 CWE: 22 CVE: 2018-5445	An arbitrary file overwrite vulnerability has been identified in Advantech WebAccess SCADA web platform. The vulnerability is caused by the lack of proper input sanitisation of the certUpdate.asp filename parameter. The vulnerability can be exploited by sending a specially-crafted request, allowing the attacker to execute code on the remote machine with the privileges of the application process.
Strike Epson AirPrint Cross-Site Scripting (XSS)	CWE: 79 CVE: 2018-5550	This strike exploits a cross-site scripting vulnerability in Epson's web configuration page for AirPrint in certain Epson printer products. This vulnerability is due to inadequate input filtering in INPUTT_GEOLOCATION parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.

Name	References	Description
Strike GitStack BasicAuth Header Unauthenticated Remote Code Execution	CWE: 20 CVE: 2018-5955 EXPLOITDB : 44356	This strike exploits a remote code execution vulnerability in GitStack. The vulnerability is due to lack of authentication check when users send a HTTP create user request and improper validation of user-supplied input. By exploiting this vulnerability, a remote, unauthenticated attacker can execute arbitrary PHP code on the target server. NOTE: When run in one-arm mode, this strike creates a backdoor script at /web/backdoor.php.
Strike Joomla SimpleCalendar Catid Array SQL Injection	CWE: 89 CVE: 2018-5974 EXPLOITDB : 44126	This strike exploits an SQL injection vulnerability in the SimpleCalendar component for Joomla!. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Joomla Aist SQL Injection	CWE: 89 CVE: 2018-5993 EXPLOITDB : 44106	This strike exploits an SQL injection vulnerability in the Aist component for Joomla! The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Joomla Project Log Search SQL Injection	CWE: 89 CVE: 2018-6024 EXPLOITDB : 44124	This strike exploits an SQL injection vulnerability in the Project Log 1.5.3 for Joomla! The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Google Chrome V8 Object Allocation Size Integer Overflow	CWE: 190 CVE: 2018-6065 GOOGLE: 1526 EXPLOITDB : 44584 BID: 103297	This strike exploits a vulnerability in the Google Chrome browser. Specifically, the vulnerability exists in the Google Chrome V8 javascript engine. By passing a prototype chain of objects with a large expected_no_of_properties the instance_size value can be controlled. An integer overflow results in too small of a value being used causing memory corruption to occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Google Chrome V8 AwaitedPromise Update Bug	GOOGLE: 1521 CWE: 19 CVE: 2018-6106 BID: 103917	This strike exploits a vulnerability in the Google Chrome browser. Specifically the vulnerability exists within the Javascript V8 engine. An attacker can craft Javascript in such a way that the AwaitedPromise method can be replaced with user Javascript through the use of a then getter. This may lead to an incorrect state in the generator, which can lead to a denial of service condition in the browser or potentially remote code execution.
Strike Trend Micro Email Encryption Gateway searchEmail SQL Injection	CWE: 89 CVE: 2018-6230 EXPLOITDB : 44166	This strike exploits an SQL injection vulnerability in Trend Micro Email Encryption Gateway. The vulnerability is due to the improper sanitization of searching string sent to searchEmail.jsp script. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure, database corruption, denial of service and others.
Strike Easy Hosting Control Panel op Parameter Reflected Cross-Site Scripting	CWE: 79 CVE: 2018-6361	This strike exploits a cross-site scripting vulnerability in Easy Hosting Control Panel. This vulnerability is due to improper sanitization of "op" parameter controlled by users in HTTP requests. By enticing an authenticated user to visit an attacker controlled webpage or click a malicious link, an attacker could manipulate database, add backdoor accounts, access any cookies, session tokens, or other sensitive information retained by the browser.
Strike Easy Hosting Control Panel domainop Action Parameter Reflected Cross-Site Scripting	CWE: 79 CVE: 2018-6362	This strike exploits a cross-site scripting vulnerability in Easy Hosting Control Panel. This vulnerability is due to improper sanitization of "domainop" action parameter controlled by users in HTTP requests. By enticing an authenticated user to visit an attacker controlled webpage or click a malicious link, an attacker could access any cookies, session tokens, or other sensitive information retained by the browser.
Strike Joomla! Hathor Postinstall Message SQL Injection	CWE: 89 CVE: 2018-6376 BID: 102916	This strike exploits an SQL injection vulnerability in Joomla! CMS. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure, database corruption, denial of service and others.
Strike Joomla! com_fields Cross-Site Scripting (XSS)	CWE: 79 CVE: 2018-6377 BID: 102917	This strike exploits a cross-site scripting vulnerability in Joomla! CMS. This vulnerability is due to inadequate input filtering in com_fields. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike D-Link Router Soapcgi Remote Code Execution	CWE: 78 CVE: 2018-6530	This strike exploits an OS command injection vulnerability in the web component of D-Link. The vulnerability is due to a flaw in the SOAP controlType URL interface. A remote unauthenticated attacker could exploit this vulnerability by sending a specially formatted SOAP request to the target system. Successful exploitation of this vulnerability could result in arbitrary command execution on the target system with root privileges.
Strike AMD Raptr execute_installer Remote File Execution	CWE: 287 CVE: 2018-6546 EXPLOITDB : 44476	This strike exploits a remote file execution vulnerability in AMD Raptr. HTTP POST requests to the execute_installer URI are intended to execute the installer file with path stored in the data parameter. However, any arbitrary executable path stored in the data parameter will be executed. An attacker can send a specially crafted HTTP POST request to cause arbitrary file execution on the target system.
Strike Joomla DT Register SQL Injection	CWE: 89 CVE: 2018-6584 EXPLOITDB : 44108	This strike exploits an SQL injection vulnerability in the DT Register 3.2.7 component for Joomla! The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Belkin Wemo Insight Smart Plug Stack Buffer Overflow	CWE: 787 CVE: 2018-6692	This strike exploits a buffer overflow vulnerability in the Belkin Wemo Smart Plug. Specifically a stack buffer overflow occurs inside the WemoApp libUPnPHandler.so library. When an attacker sends a UPnP packet with a specially crafted EnergyPerUnitCostVersion field a crash may occur. It is possible to execute code remotely on the compromised device as the root user, and because the device uses UPnP it is also possible to use the device to attack and control other smart devices like TVs.
Strike Joomla Saxum Picker SQL Injection	CWE: 89 CVE: 2018-7178 EXPLOITDB : 44136	This strike exploits an SQL injection vulnerability in the Saxum Picker 3.2.10 component for Joomla! The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Joomla Component Saxum Astro SQL Injection	CWE: 89 CVE: 2018-7180 EXPLOITDB : 44133	This strike exploits an SQL injection vulnerability in the Saxum Astro 4.0.14 component for Joomla! The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Google Golang GET Command Injection	CWE: 78  CVE: 2018-7187	This strike exploits a command execution vulnerability in Google Golang client. The vulnerability is due to insufficient sanitization of user input by the go get command. An authenticated attacker can entice the client to use "go get" on a malicious URL, a successful exploitation could result in a command injection on the target user.
Strike Homematic CCU2 2.29.23 - Remote Command Execution	CVE: 2018-7297  EXPLOITDB : 44368	This strike exploits a code execution vulnerability in the HomeMatic CCU2 control unit. This vulnerability is due to improper sanitization for the HTTP header when server sends http traffic back to client. A remote attacker can trigger this vulnerability by sending malicious request to web interface, results in read/write access and execute system commands on the target device.
Strike Joomla component Alexandria Book Library SQL Injection	CWE: 89  CVE: 2018-7312  EXPLOITDB : 44162	This strike exploits a SQL injection vulnerability in the Alexandria Book Library component for Joomla!. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this vulnerability by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Joomla CW Tags Searchtext SQL Injection	CWE: 89  CVE: 2018-7313  EXPLOITDB : 44158	This strike exploits an SQL injection vulnerability in the CW Tags for Joomla! The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Joomla Component Proclaim Backup File Download	CWE: 200  CVE: 2018-7317  EXPLOITDB : 44159	This strike exploits a file download vulnerability in Joomla! Component Proclaim. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could download sql files under backup folder via direct requests.
Strike Joomla component CheckList SQL Injection	CWE: 89  CVE: 2018-7318  EXPLOITDB : 44163	This strike exploits an SQL injection vulnerability in the CheckList component for Joomla!. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.

Name	References	Description
Strike Site Editor WordPress Plugin - Local File Inclusion	CWE: 200 CVE: 2018-7422 EXPLOITDB : 44340	This strike exploits a local file inclusion vulnerability in Site Editor WordPress plugin. The vulnerability is due to improper sanitization of "ajax_path" parameter in requests to ajax_shortcode_pattern.php script. By exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server. Note: When run in one-arm mode, this strike will retrieve the content of /etc/passwd file. The vulnerable ajax_shortcode_pattern.php script must be available at default location ( <a href="http://[server]/wp-content/plugins/site-editor/editor/extensions/pagebuilder/includes/ajax_shortcode_pattern.php">http://[server]/wp-content/plugins/site-editor/editor/extensions/pagebuilder/includes/ajax_shortcode_pattern.php</a> ).
Strike TestLink Unauthenticated Remote Code Execution	CWE: 94 CVE: 2018-7466 EXPLOITDB : 44226	This strike exploits a code injection vulnerability in TestLink Open Source Test Management. The vulnerability is due to improper sanitization and handling of user-controlled values passed for "TestLink DB login" parameter in "installNewDB.php" script. By exploiting this vulnerability, a remote, unauthenticated attacker can inject and execute arbitrary PHP code on the target server. NOTE: When run in one-arm mode, a Mysql server must be accessible at "localhost" and user "root" with password "12345" must be configured. Also a database called "testlink" must be created and Mysql must be configured to accept usernames longer than 16 characters.
Strike FasterXML jackson-databind Insecure Deserialization	CWE: 184 CVE: 2018-7489 BID: 103203	This strike exploits an insecure deserialization vulnerability in FasterXML jackson-databind. The vulnerability is due to improper validation of user input used in deserialization and instantiation of Java objects. This is an incomplete fix for CVE-2017-7525. By sending a maliciously crafted JSON input, an attacker could achieve remote code execution in the context of the vulnerable application.
Strike Cgit web server Directory Traversal	CWE: 22 CVE: 2018-7490 EXPLOITDB : 44223	This strike exploits a directory traversal vulnerability in uWSGI PHP plugin. The vulnerability is caused by insufficient validation of user input on HTTP requests. Successful exploitation could allow an attacker to have arbitrary file accessible on target system.
Strike Advantech WebAccess NMS Download Action Directory Traversal	CWE: 22 CVE: 2018-7503 BID: 104190	An arbitrary file overwrite vulnerability has been identified in Advantech WebAccess NMS. The vulnerability is caused by the lack of proper input sanitisation on file paths within DownloadAction servlet. The vulnerability can be exploited by sending a specially-crafted request, allowing the attacker to read arbitrary files.
Strike Drupal Core PHP Deserialization Remote Code Execution	BID: 103534 CWE: 20 CVE: 2018-7600	This strike exploits a vulnerability in Drupal Core open-source CMS. The vulnerability is due to improper validation of user-supplied data while performing server-side deserialization of PHP objects. A malicious user can exploit this vulnerability by sending multiple HTTP POST requests including serialized PHP objects. When successfully exploited, the vulnerability results in complete compromise of the target server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Drupal Core Form Rendering Remote Code Execution	CVE: 2018-7602 BID: 103985	This strike exploits a remote code execution flaw in Drupal Core. This vulnerability is due to improper handling of the HTTP parameter when a client sends http traffic to the server. A remote attacker can exploit this vulnerability by sending crafted http requests to the target server. Successful exploitation results in remote code execution.
Strike Sitecore CMS LogViewerDetails Directory Traversal	CWE: 22 CVE: 2018-7669	This strike exploits a path traversal vulnerability in Sitecore CMS. The vulnerability is due to insufficient validation of 'file' parameter processed in LogViewer application. Remote attackers can exploit this vulnerability by crafting a malicious HTTP request, ultimately gaining access to read arbitrary files.
Strike Schneider Electric U.motion Builder Directory Traversal	CWE: 20 CVE: 2018-7787 BID: 104447	This strike exploits a directory traversal vulnerability in Schneider Electric U.motion Builde. The vulnerability is due to improper validation of input of context parameter in HTTP GET request, which could allow the disclosure of sensitive information.
Strike Schneider Electric IIoT Monitor Zip Directory Traversal	CWE: 434 CVE: 2018-7836	This strike exploits a directory traversal vulnerability in Schneider Electric IIoT Monitor. The vulnerability is due to insufficient handling of directory traversal characters in uploaded ZIP archives uploaded to several endpoints - ProtectionMgmt, RecoveryMgmt, and UpgradeMgmt. An authenticated attacker can exploit this weakness by uploading a crafted ZIP file, allowing them to traverse directories and write arbitrary files to locations accessible by SYSTEM. This vulnerability poses a significant risk of arbitrary code execution.
Strike Schneider Electric U.Motion Builder 1.3.4 Command Injection	CWE: 89 CVE: 2018-7841	An OS command injection exists in Schneider Electric U.Motion Builder. The flaw, located in 'track_import_export.php', is a result of lack of user-supplied data sanitization and may be exploited via the 'object_id' parameter. A remote unauthenticated attack may lead to arbitrary OS commands being issued on the host system.
Strike Zoho ManageEngine Applications Manager 13.5 - Command Injection	CWE: 78 CVE: 2018-7890 BID: 103358	This strike exploits a remote code execution on Zoho ManageEngine Applications Manager 13.5. This vulnerability is due to improper handling of the UserName values under HTTP parameter when a client sends http traffic to the server. A remote attacker can exploit this vulnerability by sending crafted http requests to the target server. Successful exploitation results in remote code execution.
Strike Apache ActiveMQ Reflected Cross Site Scripting	CWE: 79 CVE: 2018-8006	A reflected cross side scripting vulnerability is present in Apache ActiveMQ. The vulnerability takes advantage of "QueueFilter" parameter that is transmitted when performing searches for queues. By exploiting this flaw, an attacker obtains client-side Javascript code execution within victim's browser which can lead to information disclosure and credentials theft.

Name	References	Description
Strike Apache CouchDB_config Command Execution	CWE: 20 CVE: 2018-8007 BID: 104741	This strike exploits a remote code execution in Apache CouchDB. The vulnerability is caused by insufficient validation of administrator supplied configuration settings on HTTP requests. Successful exploitation could allow an attacker to trigger a remote command execution on the target server.
Strike Apache Superset Import Dashboards Remote Code Execution	CWE: 502 CVE: 2018-8021 EXPLOITDB : 45933	A remote code execution exists in Apache Superset through the 'Import Dashboards' feature. The vulnerability exists as a result of an insecure 'pickle' deserialization, allowing execution of arbitrary methods from the Python library. An authenticated attacker can therefore execute arbitrary code on the target system under the user that runs the 'gunicorn' webserver.
Strike Cobub Razor channel_name POST SQL Injection	CWE: 89 CVE: 2018-8057 EXPLOITDB : 44454	An SQL injection vulnerability exists in Cobub Razor mobile analytics appliance. The vulnerability is due to insufficient user-supplied input validation within channel.php script. The successful exploitation of this vulnerability can result in database information disclosure without authentication via a specially crafted HTTP POST request.
Strike Datalust Seq - Authentication Bypass	CWE: 287 CVE: 2018-8096 EXPLOITDB : 45136	This strike exploits an authentication bypass on Datalust Seq web server. This vulnerability is due to improper use of a HTTP parameter "Name:isauthenticationenabled" under HTTP PUT request. A remote attacker can exploit this vulnerability by sending crafted HTTP PUT request to the system. Successful exploitation results in authentication bypass on target server.
Strike Microsoft Edge Chakra BoundFunction NewInstance Out of Bounds Read	CWE: 119 CVE: 2018-8139 EXPLOITDB : 45012 BID: 103977 GOOGLE: 1569	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, the vulnerability exists when the BoundFunction::NewInstance function is used to handle calls to a bound function. This method allocates a new argument array and copies the arguments into the new argument array. It will call the function without respecting the CallFlags_ExtraArg flag that indicates that there's an extra argument at the end of the array. This then results in the new array size being one less than what is required, leading to an Out of Bounds memory read. This can cause a denial of service condition in the browser or potentially lead to remote code execution.

Name	References	Description
Strike Microsoft Edge Chakra Heap Buffer Overflow	CWE: 200 CVE: 2018-8145 EXPLOITDB : 45011 BID: 103986	This strike exploits a vulnerability in the Microsoft Edge browser. It is possible to cause a heap buffer to overflow by creating new objects with specific elements as arguments that repeat in javascript. When this code is executed a buffer overflows and a denial of service condition occurs. Remote code execution may also be possible.
Strike Windows VBScript Engine Use After Free	CWE: 119 CVE: 2018-8174	This strike exploits a vulnerability in Microsoft VBScript Engine. Specifically the vulnerability fakes and overrides the array object to perform arbitrary address reading and writing. In the end, it releases code to execute after constructing an object. An attacker who successfully exploited the vulnerability could gain the same user rights as the current user.
Strike Microsoft Edge Browser Chakra Parameter Scope Parsing Type Confusion	CWE: 119 CVE: 2018-8279 GOOGLE: 1570 BID: 104641 EXPLOITDB : 45214	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically the vulnerability exists inside the Microsoft Chakra Javascript engine. It is possible to craft invalid Javascript that still gets parsed by the Chakra engine, which can result in type confusion in the InterpreterStackFrame::OP_ResumeYield method. This can cause a denial of service in the browser or potentially lead to remote code execution.
Strike Microsoft Edge ImplicitCallFlags Intl Check Bypass	CWE: 119 CVE: 2018-8288 GOOGLE: 1565	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically an attacker can craft javascript in such a way that allows for the initialization process to run without caring about the ImplicitCallFlags. This can cause a denial of service condition in the browser or potentially allow for remote code execution to occur.
Strike Microsoft Edge DictionaryPropertyDescriptor CopyFrom Type Confusion	GOOGLE: 1576 CWE: 119 CVE: 2018-8291 BID: 104637 EXPLOITDB : 45215	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically the vulnerability exists within the Javascript Chakra engine. An attacker can craft Javascript in such a way that the CopyFrom method does not copy all fields, including the IsShadowed field, from another descriptor to "this". This causes type confusion to occur, and can lead to a denial of service condition in the browser or potentially remote code execution.

Name	References	Description
Strike Windows VBScript Engine Preserve Array Use After Free	CWE: 119 CVE: 2018-8373	This strike exploits a vulnerability in Microsoft VBScript Engine. Specifically the vulnerability fakes and overrides the array object to perform arbitrary address reading and writing. In the end, it releases code to execute after constructing an object. An attacker who successfully exploited the vulnerability could gain the same user rights as the current user.
Strike Microsoft Edge Chakra PathTypeHandlerBase SetAttributesHelper Type Confusion	CWE: 119 CVE: 2018-8384 EXPLOITDB : 45431 BID: 104981 GOOGLE: 1586	This strike exploits a vulnerability in the Microsoft Edge Browser. Specifically, a type confusion vulnerability exists in the Chakra Javascript engine. When object header inlining is deoptimized, the type handler of the object is converted to a dictionary type handler. However, not all attributes belong to the dictionary type, and they are not taken into consideration. If these types are added or removed type confusion will occur. This can lead to a denial of service condition in the browser, or potentially allow for remote code execution.
Strike Microsoft Edge Open With Remote Command Execution	CWE: 20 CVE: 2018-8495 BID: 105461	This strike exploits a remote command execution in Microsoft Edge browser. The vulnerability is due to lack of parameter sanitization when running an external application with a crafted hyperlink as an argument. A user accessing an arbitrary page can be enticed to run a malicious script with a minimum of interaction, allowing the attacker to execute arbitrary commands on the system.
Strike Microsoft VBScript VariantClear Use After Free	CWE: 416 CVE: 2018-8544 GOOGLE: 1659 EXPLOITDB : 45923 BID: 105787	This strike exploits a vulnerability in the Microsoft Internet Explorer Browser. Specifically, the vulnerability exists in VBScript. If a Variant is an object, the object destructor is going to be called and the variant type will be unset. It is possible for the object destructor to then call the attacker controlled code to free the memory holding the variant, and if called upon later a use after free condition will occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft VBScript rtFilter Out of Bounds Read	CWE: 119 CVE: 2018-8552 GOOGLE: 1666 EXPLOITDB : 45924 BID: 105786	This strike exploits a vulnerability in the Microsoft Internet Explorer Browser. Specifically, the vulnerability exists in the VBScript component. An input array can be resized during an rtFilter call causing an out of bounds memory read to occur. This may lead to a denial of service condition in the browser, or potentially remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Edge Chakra InlineArrayPush InlineArrayPop Type Confusion	CWE: 119 CVE: 2018-8617 BID: 106112 EXPLOITDB : 46202	This strike exploits an vulnerability in the Microsoft Edge browser. Specifically the vulnerability exists inside the Javascript Chakra engine. It is possible to craft Javascript in such a way that when a push or pop method is used on an object with a numeric property the associated InlineArrayPop or InlineArrayPush instruction is called. It is possible to cause type confusion allowing for a denial of service condition to occur or potentially remote code execution.
Strike Microsoft VBScript SafeArray Reference Leak and Use After Free	CWE: 119 CVE: 2018-8625 BID: 106122 GOOGLE: 1668 EXPLOITDB : 46022	This strike exploits a vulnerability in the Microsoft Internet Explorer browser. Specifically, the vulnerability exists in the VBScript engine. It is possible to create VBScript in such a way that can allow for a use-after-free condition to occur when a pointer to a SafeArray object is created and stored and the object is then destroyed. This may lead to a denial of service condition in the browser, or potentially remote code execution.
Strike Microsoft Windows - jscript! JsArrayFunctionHeapSort Out-of-Bounds Write	CWE: 119 CVE: 2018-8631 EXPLOITDB : 46001	This strike exploits a vulnerability in the Microsoft Internet Explorer Out-Of-Bound write. Specifically, the vulnerability exists in the Javascript JsArrayFunctionHeapSort. It is possible to craft Javascript in such a way that will cause a denial of service condition in the browser.
Strike Nagios XI helpedit.php SQL Injection	CWE: 89 CVE: 2018-8734 EXPLOITDB : 44560	This strike exploits an SQL injection vulnerability in Nagios XI. The vulnerability is caused by insufficient validation of user input on HTTP requests which are used to create SQL queries. Successful exploitation could allow an attacker read/write abilities to sensitive information in target server.
Strike Kodi Create Playlist Persistent Cross-Site Scripting (XSS)	CWE: 79 CVE: 2018-8831 EXPLOITDB : 44487	This strike exploits a cross-site scripting vulnerability in Kodi Media Player software. This vulnerability is due to inadequate input filtering in the web interface, while creating a new playlist. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.

Name	References	Description
Strike Easy File Sharing WebServer UserID Remote Buffer Overflow	CWE: 119 CVE: 2018-9059 EXPLOITDB : 44485	This strike exploits a remote buffer overflow vulnerability in Easy File Sharing (EFS) Web Server. The vulnerability is due to insufficient validation of UserID parameter within forum.ghp. Remote attackers can exploit this vulnerability by crafting a malicious login request, ultimately gaining code execution on the target system with elevated privileges.
Strike Zoho ManageEngine OpManager OpManagerFailover Util customerName SQL Injection	CWE: 89 CVE: 2018-9088	This strike exploits an SQL injection vulnerability that exists in ManageEngine OpManager. The vulnerability results from a lack of input validation of the customerName request parameter and a lack of authentication for accessing FailOverHelperServlet servlet. A remote unauthenticated attacker could exploit this vulnerability by sending an HTTP request with a crafted customerName parameter. If the exploitation is successful, the server will execute a maliciously injected SQL statement, which may lead to data tampering in the OpManagerDB backend database and ultimately to the execution of arbitrary code with the privileges of database process.
Strike ManageEngine Recovery Manager Plus Persistent Cross-Site Scripting	BID: 103773 CWE: 79 CVE: 2018-9163 EXPLOITDB : 44666	This strike exploits a cross-site scripting vulnerability in ManageEngine Recovery Manager Plus software. This vulnerability is due to inadequate input filtering in the web interface, while creating a new technician within the technicianAction.do form. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike Jquery File Upload Arbitrary File Upload	CWE: 434 CVE: 2018-9206 EXPLOITDB : 45584 BID: 105679	This strike exploits an arbitrary file upload vulnerability in BlueImp Jquery File Upload widget. The vulnerability is due to the complete lack of server-side authorization or sanitization when handling a file upload. An attacker is thus able to create arbitrary files on the server which in most cases leads to remote arbitrary code execution.
Strike OpenEMR multiple SQL Injection	CWE: 89 CVE: 2018-9250	This strike exploits a SQL injection in OpenEMR open-source project. The vulnerability is due to insufficient user input sanitization passed through the URI, addressing various PHP scripts. A specially crafted HTTP GET request can cause a SQLi in the context of the database user.
Strike Roundcube Webmail archive.php IMAP Command Injection	CWE: 20 CVE: 2018-9846	This strike exploits a command injection vulnerability in the Roundcube Webmail. This vulnerability is due to improper handling of the HTTP parameter when a client sends http traffic to the server. A remote attacker can trigger this vulnerability by enticing an authenticated user to visit a crafted page, which sends a request to the target server. This results in arbitrary IMAP injection on the target device.

Name	References	Description
Strike SonicWall XML-RPC Remote Code Execution	CWE: 20 CVE: 2018-9866	This strike exploits a remote code execution on SonicWall Global Management System. The vulnerability is due to lack of string sanitization when updating the system's timezone via a crafted XML file. An attacker exploiting the flaw has complete access to the system as the root user.
Strike Apache Solr Config API Insecure Deserialization	CWE: 502 CVE: 2019-0192	This strike exploits an insecure deserialization vulnerability in Apache Solr. The vulnerability is due to insufficient sanitization of requests made to the Config API. This vulnerability can be exploited by sending a specially crafted HTTP request to the Config API. Successful exploitation could lead to remote code execution within the context of the server.
Strike Apache Solr DataImportHandler Code Execution	CWE: 287 CVE: 2019-0193	This strike exploits a script injection vulnerability in Apache Solr via "dataConfig" parameter in the DataImportHandler module. DataImportHandler (DIH) module allows the user to pull in data from databases and other sources. The "dataConfig" parameter allows to specify the entire DIH config as a request parameter. Since a DIH config can contain scripts, this allows the attacker to construct a threatening request on the server. Successful exploitation will result in code execution, in the context of the user running the Apache Solr service.
Strike Apache Struts2 ValueStack OGNL Remote Command Execution	CWE: 915 CVE: 2019-0230	This strike exploits a remote code execution vulnerability found in Apache Struts2 Framework. The vulnerability is due to the lack of input validation leading to a forced double Object Graph Navigation Library (OGNL) evaluation for raw user input. The vulnerability can be exploited by crafting a malicious HTTP POST request. Successful exploitation may result in executing arbitrarily code within the context of the user running the webservice.
Strike Apache Tomcat CGI enableCommandLineArguments Windows Command Injection	CWE: 20 CVE: 2019-0232 BID: 107906	This strike replicates an attack on Apache Tomcat based on a Windows command injection vulnerability. The flaw resides in the way the command arguments for a CGI script are transmitted from the request's parameters on the Windows OS. By exploiting this vulnerability, a remote unauthenticated attacker can execute commands on the host system.
Strike Apache Struts2 ParentFile.Writable File Upload Denial of Service	CVE: 2019-0233 CWE: 835	This strike exploits a file upload vulnerability in Apache Struts2. When an attacker sends an HTTP request with a crafted parameter to the server a denial of service condition on the file upload functionality will occur.

Name	References	Description
Strike Microsoft Edge Chakra Engine InitClass Type Confusion	CWE: 119 CVE: 2019-0539 BID: 106401 EXPLOITDB : 46203 GOOGLE: 1703	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically a type confusion vulnerability exists inside the Chakra Javascript engine InitClass. It is possible for an attacker to craft javascript code in such a way that type confusion will cause a memory access violation to occur. This may lead to remote code execution or a denial of service condition in the browser.
Strike Windows mshtml Engine Remote Code Execution	CWE: 20 CVE: 2019-0541 EXPLOITDB : 46536 BID: 106402	This strike exploits a vulnerability in the Microsoft mshtml Engine. The vulnerability is due to improper filtering of the "edit" parameter. An attacker could exploit this vulnerability by enticing the victim to click a malicious link and download the malicious html file. Successful exploitation may lead to remote code execution on the client.
Strike Microsoft Edge Chakra NewScObjectNoCtor Type Confusion	CWE: 119 CVE: 2019-0567 EXPLOITDB : 46203 BID: 106418 GOOGLE: 1702	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that when using the NewScObjectNoCtor or InitProto methods with the SetIsPrototype method of the type handler, a transition to a new type can cause type confusion to occur. This can lead to a denial of service in the browser or potentially lead to remote code execution.
Strike Microsoft Edge Chakra JsBuiltInEngineInterfaceExtensionObject Use After Free	CWE: 119 CVE: 2019-0568 EXPLOITDB : 46205 BID: 106420 GOOGLE: 1709	This strike exploits a vulnerability in the Microsoft Edge browser. Specifically, the vulnerability exists in the Javascript Chakra engine. It is possible to craft Javascript in such a way that when using the InjectJsBuiltInLibraryCode method an attacker can clear the disable-implicit-call flag can lead to a stack based use after free condition. This may lead to a denial of service condition in the browser, or potentially remote code execution.

Name	References	Description
Strike Microsoft SharePoint DecodeEntityInstanc eid Insecure Deserialization	CWE: 20 CVE: 2019-0604	This strike exploits an insecure deserialization vulnerability in Microsoft SharePoint. The vulnerability is due to insufficient validation of user-supplied data to 'EntityInstanceIdEncoder' class. A remote, authenticated attacker could exploit this vulnerability by sending maliciously crafted HTTP requests to a target SharePoint server. Successful exploitation of this vulnerability leads to remote code execution on the target SharePoint web application.
Strike Microsoft Windows scripting engine code execution	CWE: 119 CVE: 2019-0752	This strike exploits a vulnerability in the Microsoft Windows scripting engine. The vulnerability is due to incorrect handling of objects in memory. An attacker could exploit this vulnerability by enticing a user to view a malicious web page. Successful exploitation of the vulnerability could trigger a code execution condition on client side.
Strike Microsoft Internet Explorer VBScript Execution Policy Bypass	CWE: 254 CVE: 2019-0768 GOOGLE: 1738	This strike exploits a vulnerability in Microsoft Internet Explorer. By utilizing VBScript.Encode it is possible to bypass the MSHTML Security Zone security policy that is put in place to allow or restrict VBScript from execution.
Strike Microsoft Windows ActiveX Data Objects Code Execution	CWE: 119 CVE: 2019-0888	A code execution vulnerability has been reported in Microsoft Windows ActiveX Data Objects (ADO). The vulnerability is due to improper handling of an object. A remote attacker could exploit this vulnerability by enticing a user to open a specially crafted file. Successful exploitation could result in the execution of arbitrary code with the victim's privileges.
Strike Jenkins Script Security Plugin Authenticated Remote Command Execution	CWE: 254 CVE: 2019-10030 00 BID: 106681	This strike exploits a remote command execution vulnerability in Script Security Plugin pertaining to Jenkins master. The vulnerability is due to improper validation of data passed to the Jenkins master sandbox. A specially crafted HTTP POST request containing a sandbox script leads to remote code execution conditions on the vulnerable server.
Strike Jenkins Script Security Plugin Sandbox Bypass Vulnerability	CWE: 20 CVE: 2019-10030 29	This strike exploits a sandbox bypass vulnerability in the Jenkins Script Security Plugin. The vulnerability is due to improper validation of data passed to the Jenkins sandbox. It leverages Groovy metaprogramming to download and execute a malicious JAR file. The security plugin fails to adequately restrict the execution of untrusted code, allowing remote, unauthenticated attackers with Overall/Read permission to bypass the security sandbox and run malicious scripts. Successful exploitation could result in remote code execution.

Name	References	Description
Strike Jenkins Groovy Plugin Authenticated Remote Command Execution	CWE: 20 CVE: 2019-10030 30	This strike exploits a sandbox bypass vulnerability in Script Security Plugin pertaining to Jenkins master. The vulnerability is due to improper validation of data passed to the Jenkins master sandbox. An attacker can exploit this flaw by sending a specially crafted HTTP POST request containing a sandbox script SecureGroovyScript/checkScript. Successful exploitation of the vulnerability can lead to remote code execution on the vulnerable server.
Strike Kentico Unauthenticated Remote Code Execution via Insecure Dot Net Deserialization	CVE: 2019-10068 CWE: 502	This strike exploits an insecure deserialization vulnerability in Kentico. The vulnerability arises due to a failure to validate security headers in the staging service allowing an attacker to bypass authentication and perform arbitrary operation. An unauthenticated remote attacker can trigger insecure deserialization of user-controlled .NET objects, by sending a specially crafted request, leading to remote code execution. A successful attack could result in full compromise of the Kentico instance and underlying server.
Strike XStream Library ReflectionConverter Insecure Deserialization	CWE: 502 CVE: 2019-10173	This strike exploits an insecure deserialization vulnerability in XStream Library. The vulnerability is due to insufficient validation of event handler type in user-supplied XML data. The issue arises from default configuration changes. When converting a 'dynamic-proxy' element to a Proxy instance, XStream generates a handler object based on the 'handler' element's class attribute. Of particular concern is the java.bean.EventHandler class, which, if exploited, allows an attacker to craft a malicious 'handler' element, potentially enabling the execution of arbitrary commands. A remote attacker could exploit this vulnerability by sending specially crafted XML file to the affected application. Successful exploitation could allow the attacker to execute arbitrary command under the security context of the process.
Strike Jenkins SCM Git Client Plugin Authenticated OS Command Injection	CWE: 78 CVE: 2019-10392	An OS command injection exists in Jenkins Git Client plugin. The vulnerability is due to lack of parameter sanitization while parsing parameters set to configure a Jenkins job. By exploiting this flaw, an authenticated remote attacker can run arbitrary OS commands on the target system. Note: All versions of Jenkins Git Client below 2.8.2 are affected by this vulnerability.
Strike Jenkins CI Server build-metrics Cross-Site Scripting	CWE: 79 CVE: 2019-10475	This strike exploits a cross-site scripting vulnerability has been reported in build-metrics plugin of Jenkins CI. This vulnerability is due to insufficient input validation of user supplied query string. A remote attacker could exploit this vulnerability by enticing the target to click on a crafted link. Successful exploitation could result in execution of script code in the security context of the target user's browser.
Strike Mongo Express VM Dependency Remote Command Execution	CWE: 94 CVE: 2019-10758	This strike exploits a remote code execution vulnerability in mongo-express. This vulnerability is triggered via endpoints that uses the toBSON method and misuses the vm dependency to perform exec commands in a non-safe environment. A remote, authenticated attacker could exploit this vulnerability by sending a request to a target server. Successfully exploiting this vulnerability could result in arbitrary code execution on the target system.

Name	References	Description
Strike Joomla Core Directory Traversal	CWE: 22 CVE: 2019-10945 EXPLOITDB : 46710	This strike exploits a directory traversal vulnerability in Joomla Core 1.5.0 - 3.9.4. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this vulnerability by sending crafted HTTP traffic to the target server. Successful exploitation could lead to file access outside the media manager root directory.
Strike Lighttpd url-path-2f-decode Denial-of-Service	CWE: 190 CVE: 2019-11072 BID: 107907	This strike exploits an integer overflow vulnerability in Lighttpd. The vulnerability is due to url mishandling of /%2F? in burl.c under HTTP GET request. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in denial-of-service on the target server. *Note: The exploit will work only when the target server's configuration "url-path-2f-decode" is set to enable.
Strike RabbitMQ X-Reason HTTP Header Denial of Service	CWE: 400 CVE: 2019-11287	A denial-of-service flaw exists in Pivotal RabbitMQ, versions 3.7.x prior to 3.7.21 and 3.8.x prior to 3.8.1, and RabbitMQ for Pivotal Platform, 1.16.x versions prior to 1.16.7 and 1.17.x versions prior to 1.17.4. An authenticated attacker may crash the service by sending a crafted X-Reason HTTP header containing an Erlang format string which causes the server to allocate a massive memory region.
Strike Zoho ManageEngine Applications Manager FaultTemplateOptions.jsp resourceid SQL Injection	CWE: 89 CVE: 2019-11469 EXPLOITDB : 46740	This strike exploits an SQL injection vulnerability in Zoho ManageEngine Applications Manager. The vulnerability is caused by insufficient validation of user input "resourcetype" on HTTP requests which are used to create SQL queries. Successful exploitation could allow an attacker abilities to execute SQL queries on the target server.
Strike Pulse Connect Secure html5acc Arbitrary File Disclosure	CWE: 275 CVE: 2019-11510 BID: 108073	This strike simulates an attack on Pulse Connect Secure versions prior to 8.1R15.1, 8.2 before 8.2R12.1, 8.3 before 8.3R7.1, and 9.0 before 9.0R3.4. The flaw takes advantage of a directory traversal vulnerability and allows remote unauthenticated attackers to read arbitrary files residing on the host system.
Strike Atlassian Crowd and Crowd Data Center Arbitrary Plugin Install RCE	CWE: 732 CVE: 2019-11580	This strike exploits a vulnerability in Atlassian Crowd and Crowd Data Center due to the pdkinstall development plugin incorrectly enabled in release builds. Attackers who can send unauthenticated or authenticated requests to a Crowd or Crowd Data Center instance can exploit this vulnerability to install arbitrary plugins, which permit remote code execution on systems running a vulnerable version of the application.
Strike Atlassian JIRA Template Injection Code Execution	CWE: 94 CVE: 2019-11581	This strike exploits a remote code execution in the JIRA Template. The vulnerability is due to improper sanitization of user input which is passed to the application via the ContactAdministrators and SendBulkMail actions. A remote authorized attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation results in remote code execution on the target server.

Name	References	Description
Strike HPE Intelligent Management Center IccSelectDevTypeBean Expression Language Inject	CWE: 287 CVE: 2019-11941	This strike exploits an expression language injection vulnerability in the HPE Intelligent Management. The vulnerability is due to improper sanitization of user input "beanName" which is passed to the application via the IccSelectDevTypeBean class. A remote authorized attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation results in remote code execution on the target server with SYSTEM privilege.
Strike Internet Explorer Scripting Engine Memory Corruption	CWE: 119 CVE: 2019-1221	This strike exploits a memory corruption vulnerability in Internet Explorer. The vulnerability is due to improper handling of memory objects. By enticing a user to access a specially crafted page, an attacker could exploit this vulnerability to corrupt memory and remotely execute malicious code in the context of the current user.
Strike GrandNode Ecommerce LetsEncryptController Directory Traversal	CWE: 22 CVE: 2019-12276	This strike exploits a directory traversal vulnerability in GrandNode Ecommerce platform. The vulnerability is due to improper sanitization of parameters passed to the "LetsEncryptController" module. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.
Strike Viber for Desktop Uri Handler Remote Code Execution	CWE: 426 CVE: 2019-12569	This strike exploits a remote code execution on the Viber Desktop. The vulnerability is due to improper sanitization of user input which is passed to the application via the DLL loading path. A remote unauthorized attacker can exploit this vulnerability by enticing the victim to open a crafted web page. Successful exploitation results in remote code execution on the victim's application.
Strike Cisco IOS XE WebUI snortcheck.lua Authenticated Command Injection	CWE: 78 CVE: 2019-12650	This strike exploits a command injection vulnerability in the WebUI component of Cisco IOS XE. The vulnerability is due to improper validation of user-supplied 'snortcheck.lua' form data via the WebUI. A user with low privilege access can exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in execution of Cisco console commands with administrative privileges.
Strike Cisco IOS XE WebUI Authenticated Command Injection	CWE: 78 CVE: 2019-12651	This strike exploits a command injection vulnerability in the WebUI component of Cisco IOS XE. The vulnerability is due to improper validation of user-supplied form data via the WebUI. A user with low privilege access can exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in the execution of Cisco console commands with administrative privileges.
Strike phpMyAdmin Setup Server Removal Cross-Site Request Forgery	CWE: 352 CVE: 2019-12922	This strike simulates a CSRF attack on phpMyAdmin. The flaw is a result of no anti-CSRF technique being employed in the setup page. A remote attacker may entice a phpMyAdmin user to make a request to a crafted URL, leading to removal of arbitrary servers from the phpMyAdmin configuration.
Strike Citrix SD WAN SQL Injection	CWE: 89 CVE: 2019-12989	This strike exploits an SQL Injection vulnerability in Citrix SD-WAN. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted http requests containing shell metacharacters in sitename parameter to get_package_file endpoint. Successful exploitation could allow the attacker to achieve remote code execution.

Name	References	Description
Strike Centreon nagios path OS Command Injection	CWE: 77 CVE: 2019-13024 EXPLOITDB : 47069	An OS command injection exists in Centreon 19.04.0 due to lack of sanitization when the 'nagios' binary path is set. By exploiting this flaw, an authenticated remote attacker can run arbitrary OS commands on the target system.
Strike SolarWinds Serv-U FTP Server USER_FULL_NAME Stored Cross-Site Scripting	CWE: 79 CVE: 2019-13182	This strike exploits a stored cross-site scripting vulnerability in the SolarWinds Serv-U FTP Server. The vulnerability is due to incorrect input validation prior to using the %USER_FULL_NAME% macro to render the Web UI. A remote, authenticated attacker could exploit this vulnerability by embedding malicious script code. A successful attack may result in the execution of script code in the security context of the target user.
Strike Wordpress Plugin Like Button Authentication Bypass	CWE: 287 CVE: 2019-13344 EXPLOITDB : 47078	This strike exploits an authentication bypass on the Wordpress Plugin Like Button. The vulnerability is due to not properly checking if the request is sent by an authorized user. A remote unauthorized attacker can exploit this vulnerability by sending a crafted HTTP POST request to the system. Successful exploitation results in changing the configuration of the plugin setting.
Strike D-Link Central WiFi Manager CWM(100) IndexAction Remote Code Execution	CVE: 2019-13372 CWE: 94	A remote code execution vulnerability exists in D-Link Central WiFi Manager CWM(100) due to lack of user-supplied data sanitization. The vulnerable code resides in '/web/Lib/Action/IndexAction.class.php' source and uses the HTTP 'Cookie' header value to construct a string which is later evaluated as PHP code. By sending a crafted HTTP POST request, a remote unauthenticated attacker may run arbitrary PHP code as the SYSTEM user.
Strike D-Link Central WiFi Manager CWM(100) dbSQL SQL Injection	CVE: 2019-13373	A SQL injection vulnerability exists in D-Link Central WiFi Manager CWM(100) due to lack of user request authorization. The vulnerable code resides in '/web/Public/Conn.php' source and uses the HTTP 'dbSQL' parameter value to perform database lookups. By sending a crafted HTTP POST request, a remote unauthenticated attacker may gain access to the platform by adding user accounts or read existing data from the database.
Strike Microsoft Windows Jet Database Out of Bounds Write	CWE: 119 CVE: 2019-1359	This strike exploits an Out of Bounds Write vulnerability in Microsoft Jet Database Engine. The vulnerability is due to improper handling of objects in memory. The user would be enticed to visit a site or open a web page, causing arbitrary code to be executed.
Strike Google Chrome DesktopMediaPickerController WebContentsDestroyed Use After Free	CVE: 2019-13767 GOOGLE: 1985	This strike exploits a vulnerability in Google Chrome. An attacker can utilize the desktopCapture.chooseDesktopMedia API to trigger the WebContentsDestroyed method on a freed object causing a use after free condition to occur. This can result in a denial of service condition in the browser or potentially remote code execution.

Name	References	Description
Strike Django Json-Hstore Field SQL Injection	CWE: 89 CVE: 2019-14234	This strike exploits a SQL injection vulnerability in the Django server. The vulnerability is caused by insufficient validation of user input on HTTP requests, which are used to create SQL queries. Successful exploitation could allow an attacker to execute SQL command on the target server.
Strike HAProxy cookie Denial-of-Service	CWE: 20 CVE: 2019-14241 BID: 109352	This strike exploits a denial of service vulnerability in HAProxy server. The vulnerability is due to incorrect handling of the cookie header under HTTP traffic. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in denial-of-service on the target server.
Strike Microsoft Internet Explorer toJSON callback Use-After-Free	CWE: 119 CVE: 2019-1429	This strike exploits a vulnerability in the Microsoft Internet Explorer scripting engine. Specifically, an attacker can craft an HTML page containing a Javascript script in such a way that a call to 'jscript!JSONStringifyObject()' frees an object that is later going to be referred by 'jscript!PrepareInvoke()', resulting in a use-after-free condition. A remote attacker could exploit this vulnerability by enticing the target user to open a specially crafted web page. Successful exploitation could lead to arbitrary code execution in the security context of the target user.
Strike Wordpress Plugin UserPro Reflected Cross-Site Scripting	CWE: 79 CVE: 2019-14470 EXPLOITDB : 47304	This strike exploits a cross-site scripting vulnerability in Wordpress Plugin UserPro. This vulnerability is due to inadequate input filtering of "error_description" in the web interface. An attacker could exploit this vulnerability by enticing a user to visit an attacker controlled webpage or click a malicious link. By exploiting this vulnerability an attacker could trigger reflected cross site scripting on the victim's browser.
Strike OpenEMR ajax_download.php Directory Traversal Vulnerability	CVE: 2019-14530	This strike exploits a directory traversal vulnerability in OpenEMR. The vulnerability is located in the ajax_download.php script, specifically in the improper validation of the fileName parameter. Exploiting this vulnerability allows a remote, authenticated attacker to read or delete arbitrary files on the server, potentially leading to information disclosure or denial-of-service conditions.
Strike FusionPBX service_edit.php Authenticated OS Command Injection	CWE: 77 CVE: 2019-15029	An OS command injection exists in FusionPBX 4.4.8 due to lack of parameter sanitization while parsing requests to 'service_edit.php'. By exploiting this flaw, an authenticated remote attacker can run arbitrary OS commands on the target system.
Strike Webmin password_change.cgi Unauthenticated Remote Command Execution	CWE: 77 CVE: 2019-15107 EXPLOITDB : 47293	An OS command injection vulnerability exists in Webmin 1.920 and prior versions. The flaw exists in the password change functionality and is reachable via the '/password_change.cgi' endpoint. By exploiting this vulnerability, a remote unauthenticated attacker may execute arbitrary OS commands on the target system.

Name	References	Description
Strike Palo Alto GlobalProtect sslmgr Remote Code Execution	CWE: 20 CVE: 2019-1579	This strike exploits a format string vulnerability on Palo Alto GlobalProtect server. The flaw resides in the 'sslmgr' endpoint due to lack of user input validation. A remote unauthenticated attacker may thus crash a vulnerable instance or even execute arbitrary code.
Strike Cisco DCNM SecurityManager Hard-Coded Cryptographic Key Authentication Bypass	CVE: 2019-15976	This strike exploits an authentication bypass vulnerability in Cisco Data Center Network Manager. The vulnerability exists due to the use of a hard-coded cryptographic key shared across installations for validating Single Sign-On (SSO) tokens. A remote, unauthenticated attacker could exploit this vulnerability by crafting a valid SSO token, allowing them to bypass authentication and execute arbitrary actions through the SOAP API with administrative privileges.
Strike Cisco Data Center Network Manager saveZoneInputFileTo Server Directory Traversal	CWE: 22 CVE: 2019-15980	This strike exploits a directory traversal vulnerability in Cisco Data Center Network Manager. The vulnerability is due to insufficient validation of 'filename' HTTP parameter in the 'saveZoneInputFileToServer' method. An authenticated attacker can exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation results in arbitrary file write, which can be used to achieve remote code execution with SYSTEM privileges.
Strike Cisco Data Center Network Manager getConfigTemplateFile Name SQL Injection	CWE: 89 CVE: 2019-15984	This strike exploits a SQL injection vulnerability in Cisco Data Center Network Manager. The vulnerability is due to insufficient input validation when processing HTTP requests within the 'getConfigTemplateFileName' method pertaining to the 'ConfigTemplateHandler' Java class. An authenticated attacker can exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation could result in the code execution under the security context of the database process.
Strike D-Link DNS-320 ShareCenter Unauthenticated Remote Code Execution	CWE: 78 CVE: 2019-16057	An OS command injection vulnerability exists in D-Link DNS-320 ShareCenter versions <= 2.05.B10. The flaw is a result of no input sanitization on the 'port' parameter 'login_mgr.cgi' cgi requests. A remote unauthenticated attacker may issue system commands with 'root' privileges.
Strike Harbor Project Harbor user API Privilege Escalation	CWE: 862 CVE: 2019-16097	This strike exploits a privilege escalation vulnerability in Harbor. The vulnerability is due to insufficient validation of HTTP requests to the users API. The Post() function in user.go decodes JSON data from the request body which checks for the existence of a user, and creates a new user if necessary. If the JSON payload contains the "has_admin_role" key set to "true", the resulting user account is granted admin privileges. A remote attacker could exploit this vulnerability by sending an API request with a crafted JSON payload. Successful exploitation of this vulnerability could allow the attacker to create users with admin privileges.
Strike YouPHPTube checkConfiguration.php Remote Code Execution	CWE: 862 CVE: 2019-16124	This strike exploits an access control vulnerability in the checkConfiguration.php script of YouPHPTube. The vulnerability is due to a failure on part of the script to properly validate user requests. A remote attacker with knowledge of the database credentials could exploit this vulnerability by sending a crafted request to checkConfiguration.php and then subsequently browsing to the homepage. Successful exploitation allows the attacker to execute arbitrary code under the context of the server.

Name	References	Description
Strike Cisco Prime Data Center Network Manager Arbitrary File Upload	CWE: 264 CVE: 2019-1620 BID: 108906 EXPLOITDB : 47016	This strike exploits a path traversal vulnerability found in Cisco Data Center Network Manager (DCNM). The vulnerability is due to incorrect permission settings in affected DCNM software. An unauthenticated attacker could exploit this vulnerability by uploading a malicious file to the administrative web interface. A successful exploit could allow the attacker to write arbitrary files on the filesystem and execute code with root privileges on the affected device.
Strike Nostromo nhttpd http_verify Directory Traversal	CVE: 2019-16278 CWE: 22	This strike exploits a directory traversal vulnerability in Nostromo nhttpd server. The vulnerability is due to a failure on part of the <code>http_verify</code> function to properly parse user requests. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request to the target server. Successful exploitation could result in information disclosure and in the worst case, allows the attacker to execute arbitrary system commands under the context of the server process.
Strike Cisco Small Business authenticated Command Injection	CWE: 20 CVE: 2019-1652 BID: 106728 EXPLOITDB : 46243	This strike exploits a OS command injection vulnerability found in Cisco Small Business RV320 and RV325 routers. The vulnerability is due to improper validation of user-supplied input. An attacker could exploit this vulnerability by crafting a special HTTP POST request. A successful exploit could allow the attacker to execute arbitrary commands on the underlying Linux shell as root.
Strike Cisco Small Business Unauthenticated Information Disclosure	CWE: 284 CVE: 2019-1653 BID: 106732 EXPLOITDB : 46262	This strike exploits a information disclosure vulnerability found in Cisco Small Business RV320 and RV325 routers. The vulnerability is due to improper access controls for URLs. An attacker could exploit this vulnerability by connecting to an affected device via HTTP or HTTPS and requesting specific URLs. A successful exploit could allow the attacker to download the router configuration or detailed diagnostic information.
Strike rConfig ajaxServerSettingsChk Command Injection	CWE: 78 CVE: 2019-16662	A command injection vulnerability exists in the rConfig network device configuration management tool. The vulnerability is due to insufficient input validation in the 'ajaxServerSettingsChk.php' module. A remote, unauthenticated attacker can create a malicious HTTP request resulting in arbitrary command execution on the target system with the privileges of the user running the web server.
Strike vBulletin widget_php Remote Code Execution	CWE: 20 CVE: 2019-16759	A server-side template injection vulnerability that leads to remote code execution exists in vBulletin versions 5.0.0 up to 5.5.4. By exploiting it, a remote unauthenticated attacker may execute arbitrary code using server's PHP engine.

Name	References	Description
Strike WiKID 2FA Enterprise Server SQL Injection in searchDevices.jsp	CVE: 2019-16917	This strike exploits an SQL injection vulnerability in WiKID 2FA Enterprise Server. The vulnerability exists due to improper sanitization of user-supplied input in the searchDevices.jsp file. A remote, authenticated attacker could leverage this flaw by sending specially crafted HTTP requests, potentially leading to the execution of arbitrary SQL commands on the backend database.
Strike OpenProject sortBy query Reflected Cross Site Scripting	CWE: 79 CVE: 2019-17092	This strike exploits a reflected cross-site scripting vulnerability found in OpenProject Web interface. This vulnerability is due to inadequate input filtering in the web interface, while parsing input passed to 'sortBy' parameter within 'projects' page. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike WiKID 2FA Enterprise Server processPref.jsp SQL Injection Vulnerability	CVE: 2019-17117	This strike exploits an SQL injection vulnerability in WiKID 2FA Enterprise Server. The vulnerability exists due to improper sanitization of user-supplied input in the processPref.jsp file. A remote, authenticated attacker can leverage this flaw by sending specially crafted HTTP requests, potentially leading to the execution of arbitrary SQL commands on the backend database.
Strike Zoho ManageEngine OpManager OPMDeviceDetailsServlet SQL Injection	CWE: 89 CVE: 2019-17602	This strike exploits an SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability is caused by insufficient validation of parameter category. Successful exploitation could allow an attacker abilities to execute SQL queries on the target server.
Strike Cisco Prime Infrastructure EPNM XmpLogFilesDownloadServlet Directory Traversal	BID: 108351 CWE: 22 CVE: 2019-1819	This strike exploits a directory traversal vulnerability in Cisco Prime Infrastructure EP NM. The vulnerability is due to improper sanitization of the "downloadDirectory" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.
Strike Cisco Prime Infrastructure Health Monitor - TarArchive Directory Traversal	CWE: 20 CVE: 2019-1821 BID: 108339 EXPLOITDB : 47016	This strike exploits a path traversal vulnerability found in Cisco Prime Infrastructure (PI) and Cisco Evolved Programmable Network (EPN) Manager. The vulnerability is due to improper validation of user-supplied input. An attacker could exploit this vulnerability by uploading a malicious file to the administrative web interface. A successful exploit could allow the attacker to execute code with root-level privileges on the underlying operating system.
Strike Cisco Elastic Services Controller RESR API Authentication Bypass	CWE: 287 CVE: 2019-1867 BID: 108184	This strike exploits an authentication bypass vulnerability in the Cisco Elastic Services Controller. The vulnerability is due to improper filtering of the "Authorization" header. An attacker could exploit this vulnerability by sending a crafted http traffic to the target server. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could achieve authentication bypass on the target server.

Name	References	Description
Strike rConfig HTTP ajaxArchiveFiles OS Command Injection	CWE: 78 CVE: 2019-19509	An OS Command Injection exists in rConfig 3.9.3 and prior versions as a result of no sanitization of user supplied data. The parameter processed in 'ajaxArchiveFiles.php' is then used as a command line argument within a privileged command. By sending a crafted 'path' parameter to '/lib/ajaxHandlers/ajaxArchiveFiles.php' path, a remote authenticated attacker may execute arbitrary OS commands as a superuser.
Strike Citrix Application Delivery Controller Command Injection via vpn Directory Traversal	CWE: 22 CVE: 2019-19781	An OS command injection vulnerability exists in Citrix Application Delivery Controller (ADC) and Gateway 10.5, 11.1, 12.0, 12.1, and 13.0. The command injection is possible using a directory traversal flaw, due to improper sanitization of multiple fields in HTTP requests. The flaw may be exploited by an unauthenticated attacker to execute arbitrary commands on the target server.
Strike Oracle Java Arbitrary File Deletion	CWE: 284 CVE: 2019-2449 BID: 106597	This strike exploits an arbitrary file deletion vulnerability in Oracle SE 8. The vulnerability is due to improper filtering of jlnp URL variable. An attacker can entice the victim to click the malicious link. Successful exploitation may lead to file deletion on client side.
Strike Oracle WebLogic Server FileDistributionServlet Information Disclosure	CWE: 22 CVE: 2019-2615	The strike exploits a directory traversal vulnerability in Oracle WebLogic Server. The vulnerability arises from inadequate validation of the adminPath, file_name, and wl_managed_server_independence_request_filename headers associated with the file download feature in the WebLogic server, provided by the bea_wls_management_internal2.war application. An authenticated remote attacker could exploit this vulnerability by specifying relative or absolute path HTTP GET request headers. Successful exploitation leads to the disclosure of arbitrary file contents within the target system.
Strike Oracle Weblogic DeploymentService Arbitrary File Upload RCE	CWE: 284 CVE: 2019-2618	This strike simulates an arbitrary file upload attack on Oracle Weblogic. The vulnerability is a result of no sanitization for the 'wl_upload_application_name' header. Successful exploitation requires valid credentials and leads to arbitrary file upload and remote code execution.
Strike Oracle E-Business Suite General Ledger SQL Injection	CWE: 284 CVE: 2019-2638	A SQL injection vulnerability exists in the 'General Ledger' component of Oracle E-Business Suite. A SQL query may be sent via the 'Thin Client Framework' protocol over HTTP, which is later processed in the 'DataManagerServer.readSynch()' method located in 'oracle/apps/gl/jahe/tcf/server/DataManagerServer.java'. The string is then used as a base string for a database query. By exploiting this flaw, a remote unauthenticated attacker may execute arbitrary database queries.

Name	References	Description
Strike Oracle Weblogic Server AsyncResponseService Deserialization Remote Code Execution	CWE: 284 CVE: 2019-2725 BID: 108074 EXPLOITDB : 46780	This strike simulates a remote code execution attack on a Oracle Weblogic Server. The flaw is due to no authentication and no client input sanitization on server when receiving SOAP calls. By exploiting a vulnerable system, a remote unauthenticated attacker is able to execute arbitrary commands on the target system.
Strike Oracle Weblogic Server CoordinatorPortType Deserialization Remote Code Execution	CWE: 284 CVE: 2019-2729	This strike simulates a remote code execution attack on Oracle Weblogic Server. The flaw is due to lack of authentication and input sanitization when the server receives SOAP calls. By exploiting a vulnerable system, a remote unauthenticated attacker is able to execute arbitrary commands on the target system.
Strike Atlassian Confluence Server file inclusion	CWE: 22 CVE: 2019-3396 BID: 107543	This strike exploits a file inclusion and remote command execution vulnerability in Atlassian Confluence Server. The vulnerability is due to improper sanitization of the "_template" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server and achieve file inclusion or achieve remote command execution by SSTI, inject malicious template and have it executed.
Strike Atlassian Confluence Download Attachments Remote Code Execution	CWE: 22 CVE: 2019-3398	This strike exploits a path traversal vulnerability in the downloadallattachments resource of Confluence Server and Data Center. The vulnerability is due to improper validation of parameters in a HTTP POST request. To exploit this vulnerability, a remote, authenticated attacker who has the permission to add attachments to pages or blogs can upload a file with directory traversal characters in its name. After that, when Download All functionality is used, it copies the file at the traversed location. A successful attack may result in arbitrary command execution in the context of the server process. Note: The JSESSIONID cookie and CSRF token are acquired during authentication (not shown).
Strike OpenEMR download_template.php Directory Traversal	CWE: 22 CVE: 2019-3967	This strike exploits a directory traversal vulnerability in OpenEMR. The vulnerability is due to improper sanitization of the "form_filename" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.
Strike OpenEMR scanned_notes-new.php OS Command Injection	CWE: 77 CVE: 2019-3968	A command injection vulnerability exists in OpenEMR 5.0.1 and earlier, within 'scanned_notes/new.php' form file, as a result of weak user input sanitization. By sending a crafted 'id' parameter in a HTTP request, a remote authenticated attacker might execute arbitrary system commands.
Strike Exhibitor UI Command Injection	CWE: 78 CVE: 2019-5029	This strike exploits a command injection vulnerability in the Exhibitor Web UI. The vulnerability is due to improper parsing of parameters passed to the config editor web form. A malicious attacker can exploit this by performing a specially-crafted HTTP request. Successful exploitation leads to arbitrary commands being run in the context of the user running the Exhibitor server.

Name	References	Description
Strike HPE IMC Expression Language Injection via beanName Parameter	CVE: 2019-5373	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability exists due to improper validation of the `beanName` parameter in the `CustomReportTemplateSelectBean` class. A remote, authenticated attacker can leverage this flaw to execute arbitrary code on the target system with SYSTEM-level privileges.
Strike HPE Intelligent Management Center Expression Language Injection Vulnerability cve_2019_5385	CVE: 2019-5385	This strike exploits an Expression Language injection vulnerability in HPE Intelligent Management Center. The vulnerability resides in the insufficient validation of the beanName parameter within the perfSelectTask endpoint. Exploiting this flaw allows a remote attacker to execute arbitrary code on the target system under the security context of the SYSTEM user.
Strike HPE Intelligent Management Center ViewBatchTaskResultDetailBean Expression Language Injection	CWE: 74 CVE: 2019-5386	This strike exploits a remote code execution in the HPE Intelligent Management Center. The vulnerability is due to improper sanitization of user input "beanName" which is passed to the application via the ViewBatchTaskResultDetailBean class. A remote authorized attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation results in remote code execution on the target server with SYSTEM privilege.
Strike Ruby on Rails template_renderer Accept Header File Disclosure	CWE: 200 CVE: 2019-5418	The strike replicates an attack on Ruby on Rails which leads to arbitrary file disclosure. The vulnerability resides in the lack of validation of the "Accept" header which is further parsed within the "template_renderer.rb" file in order to return the template file to be rendered. By exploiting this, a remote unauthenticated attacker may read arbitrary files on the host system.
Strike Ruby on Rails Token Disclosure Active Storage RCE	CWE: 20 CVE: 2019-5420 EXPLOITDB : 46785	This strike replicates a remote code execution attack on Ruby on Rails (<5.2.2.1, <6.0.0.beta3). The flaw resides in the deterministic way the platform generates its secret token in development mode, making it easy to be guessed. A successful exploitation results in arbitrary code execution through Marshal object injection.
Strike Chrome browser FileReader API use after free	CWE: 416 CVE: 2019-5786	This strike replicates a use-after-free exploit for Chromium browser engine. The vulnerability can be triggered via the FileReader JS API by creating two array references to the same file reader result then using another mechanism to free the underlying memory. By successfully exploiting this flaw, an attacker can execute arbitrary code in the context of the Chrome's 'renderer' process.
Strike Drupal Core Phar Stream Insecure PHP Deserialization	CWE: 20 CVE: 2019-6339	A remote code execution vulnerability exists in Drupal 7.x before 7.62, Drupal 8.5.x before 8.5.9 and Drupal 8.6.x before 8.6.6. The vulnerability is located within the PHP's built-in phar stream wrapper, when performing file operations on an untrusted 'phar://' URI. A remote attacker can exploit this vulnerability by sending a crafted HTTP packet to the target service. Successful exploitation could lead to arbitrary code execution or crash of the vulnerable application.

Name	References	Description
Strike Drupal REST API PHP deserialization Remote Code Execution	CWE: 20 CVE: 2019-6340 BID: 107106	A remote code execution vulnerability exists in Drupal 8.5.x before 8.5.11 and Drupal 8.6.x before 8.6.10. The vulnerability is due to the lack of data sanitization originating from non-form sources in the REST module. A remote attacker can exploit this vulnerability by sending a crafted HTTP packet to the target service. Successful exploitation could lead to arbitrary code execution or crash of the vulnerable application.
Strike ES File Explorer File Manager Policy Bypass	CWE: 306 CVE: 2019-6447	This strike exploits a policy bypass vulnerability in the android app ES File Explorer File Manager. The vulnerability is due to misconfigured access control of a web server listening for commands. A remote, unauthenticated attacker could exploit this vulnerability by sending a malicious request to an Android device running a vulnerable version of the product. Successful exploitation of this vulnerability could allow the attacker to download then launch applications as well as read arbitrary files. *NOTE: In OneArm mode, the strike will try to perform one of the following actions depending on the variant ran - open the settings app or list Files or download the /system/bin/cp binary present on the victim android device.
Strike QNAP Photo Station Improper Access Control Vulnerability	CVE: 2019-7192 CWE: 863	This strike exploits an improper access control vulnerability in Qnap Photostation. The vulnerability exists due to insufficient validation of user-supplied parameters in backend API endpoints. An unauthenticated attacker with network access to the affected QNAP NAS can exploit this issue by sending crafted requests to specific Photo Station APIs, which may result in unauthorized access to system files.
Strike Nexus Repository Manager 3 Remote Code Execution	CWE: 284 CVE: 2019-7238	This strike exploits a remote code execution on Nexus Repository Manager 3. This vulnerability is due to improper handling of the "value" parameter under HTTP parameter when a client sends http traffic to the server. A remote unauthenticated attacker can exploit this vulnerability by sending crafted http requests to the target server. Successful exploitation results in remote code execution.
Strike Nice Linear eMerge E3-Series OS Command Injection Vulnerability	CWE: 78 CVE: 2019-7256	This strike exploits a command injection vulnerability in Linear eMerge E3-Series. The vulnerability is due to insufficient sanitizing of user supplied inputs. With port 80 exposed to the internet for remote management, an unauthenticated attacker could exploit this vulnerability. The attacker gains complete control over critical infrastructure, potentially using compromised devices in distributed denial-of-service attacks.
Strike SonicWall SMA100 SQL Injection Vulnerability	CWE: 89 CVE: 2019-7481	This strike exploits SQL injection vulnerability in SonicWall SMA100. The vulnerability is due to improper neutralization of special elements used in SQL command. Successful exploitation of this vulnerability could allow an attacker to execute arbitrary SQL commands, potentially leading to unauthorized access
Strike Elastic Kibana Timelion Prototype Pollution Remote Code Execution	CWE: 77 CVE: 2019-7609	This strike replicates a remote code execution attack on Elastic Kibana, through a JavaScript prototype pollution vector. The vulnerability is due to lack of sanitization for user supplied data when parsing Timelion component requests. By exploiting this flaw, a remote unauthenticated attacker might execute arbitrary code on the target system.

Name	References	Description
Strike Adobe Coldfusion CFFILE File Upload	CWE: 434 CVE: 2019-7838	This strike exploits a file upload vulnerability in Adobe Coldfusion. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this vulnerability by sending crafted HTTP traffic to the target server. Successful exploitation could lead to file upload and code execution on the target server.
Strike Zoho ManageEngine ServiceDesk Plus Arbitrary File Upload	CWE: 434 CVE: 2019-8394 EXPLOITDB : 46413	This strike exploits a file upload vulnerability in Zoho ManageEngine ServiceDesk Plus. Files can be uploaded to the target by sending an HTTP POST request with a parameter 'module' equal to 'CustomLogin'. An attacker can send a malicious HTTP POST request to upload an arbitrary file to '/custom/login' folder. Successful exploitation may lead to creation and execution of arbitrary files by an authenticated user with minimum permissions (for example, guest).
Strike Apple Safari Webkit AIR Dangling Pointer Register	CWE: 119 CVE: 2019-8611 GOOGLE: 1788	This strike exploits a vulnerability in Apple Safari Webkit. Specifically after optimizations are performed on AIR code, a register gets marked as late use and ultimately is determined to be a dead register and discarded. It may be possible for an attacker to construct Javascript in such a way that it is possible to control the data in this dangling register. This can cause a denial of service condition in the browser or potentially allow for remote code execution to occur.
Strike Apple Safari Webkit ValueProfiles Use After Free	CWE: 119 CVE: 2019-8672 GOOGLE: 1825	This strike exploits a vulnerability in Apple Safari Webkit. Specifically a JSValue ValueProfile pointing to a previously freed chunk of memory which will have its JSCell header overwritten. When this gets accessed out of bounds a crash will occur. An attacker can craft javascript in such a manner that will cause memory corruption to occur, causing a denial of service in the browser and potentially leading to remote code execution.
Strike Apple Safari Webkit emitEqualityOpImpl Wrongly Replaced Method	CWE: 119 CVE: 2019-8684 GOOGLE: 1850	This strike exploits a vulnerability in Apple Safari Webkit. It is possible for an attacker to construct Javascript in such a way that when the emitEqualityOpImpl method is called it will incorrectly replace the typeof instruction with the is_cell_with_type instruction. This can cause a denial of service condition in the browser or potentially allow for remote code execution to occur.
Strike Apple Safari Webkit ArgumentsEliminationPhase Uninitialized Variable Access	CWE: 119 CVE: 2019-8689 GOOGLE: 1876	This strike exploits a vulnerability in Apple Safari Webkit. Specifically when trying to inline GetByVal operations on stack-allocated arguments the code fails to properly check whether index is lower than numberOfArgumentsToSkip. This can potentially lead to uninitialized variable access which can cause a denial of service condition in the browser or allow for remote code execution to occur.

Name	References	Description
Strike WordPress Core wp_crop_image Local File Inclusion Remote Code Execution	CWE: 94 CVE: 2019-8942 BID: 107088 EXPLOITDB : 46511	The strike exploits a local file inclusion vulnerability in WordPress platform, leveraged beforehand by a path traversal via the 'wp_attached_file' parameter. By supplying a 'wp_page_template' metadata parameter, the attacker determines the theme engine to include a malicious uploaded file. By exploiting this vulnerability an authenticated attacker gains remote code execution on the target host system.
Strike WordPress Core _wp_attached_file Post Edit Directory Traversal	CWE: 22 CVE: 2019-8943 BID: 107089 EXPLOITDB : 46511	The strike emulates a path traversal attack on WordPress CMS platform. The attack can be carried by a low privileged user by providing a '_wp_attached_file' parameter when editing media files, thus modifying post metadata. By leveraging this vulnerability with a local file inclusion exploit, an attacker may gain code execution on the host system.
Strike ThinkPHP 5.x Remote Code Execution	CWE: 20 CVE: 2019-9082 EXPLOITDB : 45978 EXPLOITDB : 46150	This strike exploits a remote command execution vulnerability in ThinkPHP 5.x less than v5.0.23, v5.1.31. The vulnerability is due to improper validation of parameters in a HTTP GET request. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in arbitrary command execution in the context of the server process.
Strike Joomla component J2Store SQL Injection	EXPLOITDB : 46467 CWE: 89 CVE: 2019-9184	This strike exploits a SQL injection vulnerability in the J2Store component 3.x - 3.3.6 for Joomla!. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this vulnerability by sending specifically crafted packets, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike WordPress Plugin Localize 1.0 Local File Inclusion	EXPLOITDB : 46537 CWE: 77 CVE: 2019-9618	This strike exploits a remote file inclusion vulnerability in WordPress Plugin Grace. The vulnerability is due to improper sanitization of the "cfg" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.

Name	References	Description
Strike Synacor Zimbra Collaboration Suite Mailboxd Component XXE Vulnerability	CVE: 2019-9670 CWE: 611	This strike exploits an XXE vulnerability in Synacor Zimbra Collaboration Suite. This vulnerability lies in the Mailboxd component. A remote unauthenticated attacker can exploit this vulnerability by crafting a specially crafted XML payload containing malicious code and targeting the Autodiscover/Autodiscover.xml endpoint. Successful exploitation of this vulnerability could lead to data exposure.
Strike Symantec DLP ProtectManager Persistent XSS	CWE: 79 CVE: 2019-9701 EXPLOITDB : 47071	This strike simulates a stored XSS attack on Symantec DLP 15.5 MP1. The flaw exists in '/ProtectManager/enforce/admin/senderrrecipientpatterns/list' endpoint due to lack of sanitization for the 'name' parameter. A successful authenticated attacker is thus able gain control of victim's browser.
Strike WordPress Comment Content Filter Remote Code Execution	CVE: 2019-9787 CWE: 352	This strike exploits a remote code execution vulnerability in WordPress. The vulnerability is due to lack of protection against cross-site request forgery attack and improper validation of the comment content in the wp_rel_nofollow_callback function which leads to stored cross-site scripting issue. A remote, unauthenticated attacker could exploit this vulnerability by enticing an authenticated user to open a web page or link. Successful exploitation, in the worst case, could lead to execution of arbitrary PHP code. *NOTE - In this strike we are just covering the initial stages of exploitation where the attacker serves the website with the malicious link
Strike Mozilla Firefox IonMonkey MArraySlice Out of Bounds Write	CWE: 119 CVE: 2019-9810	This strike exploits a vulnerability in Spidermonkey, the Javascript engine of Mozilla Firefox. The issue is caused by incorrect alias information for Array.prototype.slice method within IonMonkey JIT compiler component. This can lead to a denial of service or potentially allow for remote code execution to occur.
Strike Mozilla Firefox Spidermonkey IonMonkey ObjectGroup Type Confusion	CWE: 704 CVE: 2019-9816 GOOGLE: 1808	This strike exploits a vulnerability in Mozilla Firefox. Specifically, the vulnerability exists in the Javascript engine Spidermonkey. It is possible to craft Javascript in such a way that in IonMonkey an unexpected ObjectGroup in an ObjectGroupDispatch operation might allow for unsafe code to execute. This could cause type confusion to occur causing a denial of service condition in the browser or potentially allowing for remote code execution to occur.
Strike WordPress Social Warfare Plugin Authenticated Remote Command Execution	CWE: 79 CVE: 2019-9978	This strike exploits a design weakness in the WordPress plugin Social Warfare, stemming from insufficient input validation and sanitization. A remote unauthenticated attacker could exploit this vulnerability by sending a specially crafted request to the server. Successful exploitation could result in remote code execution, allowing the attacker to execute arbitrary code on the affected server.

Name	References	Description
Strike Microsoft SQL Server Reporting Services Remote Code Execution	CWE: 502 CVE: 2020-0618	An insecure deserialization vulnerability exists in Microsoft SQL Server Reporting Services. The vulnerability is due to improper handling of requests to the ReportViewer.aspx page a remote authenticated attacker could exploit this vulnerability by sending a crafted parameter(NavigationCorrector\$ViewState). Successfull exploitation the vulnerability allows the attacker to execute code in the context of the user running the server.
Strike Microsoft SharePoint Workflows XOML Injection	CWE: 91 CVE: 2020-0646	This strike exploits a code injection vulnerability in Microsoft .NET framework. The vulnerability is due to improper sanitization of parameters during Workflow compilation in .NET, which SharePoint relies on to compile and execute workflows. Remote attackers can exploit this flaw by injecting malicious code into Workflow definitions using specially crafted .XOML files, leading to arbitrary code execution on the SharePoint server.
Strike Microsoft Internet Explorer comparator sort method Use-After-Free	CWE: 119 CVE: 2020-0674	This strike exploits a vulnerability in the Microsoft Internet Explorer scripting engine. Specifically, an attacker can craft an HTML page containing a Javascript script which creates an array of objects, and the object is reassigned in a custom sort function which then calls 'CollectGarbage()' resulting in use after free condition due to a dangling pointer. A remote attacker could exploit this vulnerability by enticing the target user to open a specially crafted web page. Successful exploitation could lead to arbitrary code execution in the security context of the target user.
Strike Microsoft Exchange Server Fixed Cryptographic Key Remote Code Execution	CWE: 502 CVE: 2020-0688	A remote code execution vulnerability exists in Microsoft Exchange Server due to a hardcoded validation key. A remote authenticated attacker may send a crafted serialized 'ViewState' object, which gets deserialized on the server to achieve remote code execution as the 'SYSTEM' user.
Strike SolarWinds Orion API Authentication Bypass	CWE: 287 CWE: 288 CVE: 2020-10148	This strike exploits an authentication bypass vulnerability in SolarWinds Orion API. The vulnerability is due to insufficient validation of path components in a HTTP POST request. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in API commands execution.
Strike Zoho ManageEngine Desktop Central FileStorage getChartImage Command Injection	CWE: 502 CVE: 2020-10189 EXPLOITDB : 48224	This strike exploits a Java deserialization vulnerability in the Zoho ManageEngine Desktop Central. This vulnerability is in the getChartImage function of the FileStorage class, due to lack of proper validation of user-supplied data, which results in deserialization of untrusted data. A remote unauthenticated attacker can exploit this vulnerability by sending crafted HTTP requests to the target server. Successful exploitation results in remote code execution under the context of SYSTEM/root.

Name	References	Description
Strike Sonatype Nexus Repository Manager ContentSelectorsApi Resource Stored Cross-Site Scripting	CWE: 79 CVE: 2020-10203	This strike exploits a stored cross-site scripting vulnerability in Sonatype Nexus Repository Manager. The vulnerability results from inadequate input validation in the content-selectors REST API request within the Java class ContentSelectorsApiResource. This flaw allows an authenticated attacker to inject malicious script code into the database by sending a carefully crafted request to the target server. Successful exploitation of this vulnerability could lead to the execution of arbitrary code within the security context of the user's browser.
Strike rConfig commands.inc.php SQL Injection	CWE: 89 CVE: 2020-10220	This strike exploits a SQL Injection vulnerability in the rConfig server. The vulnerability is caused by insufficient validation of the 'searchField' and 'searchColumn' parameter in the 'commands.inc.php' module. Successful exploitation could allow an attacker to execute SQL command on the target server.
Strike rconfig misconfigured post os command injection	CWE: 78 CVE: 2020-10221	This Strike exploits OS Command Injection Vulnerability against rconfig. The vulnerability is due to Improper Neutralization of elements such as HTTP POST in the configuration. An attacker can exploit this vulnerability by sending OS commands via shell metacharacters in the filename POST parameter. Successful Exploitation would result in the OS command Execution within the context of the user running rconfig.
Strike Advantech WebAccess NMS Save Background Action Directory Traversal	CWE: 22 CVE: 2020-10619	An arbitrary file overwrite vulnerability has been identified in Advantech WebAccess NMS. The vulnerability is caused by the lack of proper input sanitisation on file paths within saveBackground servlet. The vulnerability can be exploited by sending a specially-crafted request, allowing the attacker to delete arbitrary files.
Strike Advantech WebAccess NMS LicenseImportAction Arbitrary File Upload Vulnerability	CVE: 2020-10621	This strike exploits an arbitrary file upload vulnerability in Advantech WebAccess NMS. The vulnerability resides in the insufficient validation of file paths within the licenseImportAction.action endpoint. A remote, unauthenticated attacker could leverage this flaw to upload malicious files, potentially leading to arbitrary code execution under the SYSTEM user context.
Strike Advantech WebAccess NMS download.jsp Directory Traversal Vulnerability	CVE: 2020-10631	This strike exploits a directory traversal vulnerability in Advantech WebAccess NMS. The vulnerability is located in the download.jsp endpoint, where insufficient input validation is performed on the filename parameter. Exploiting this vulnerability allows a remote, unauthenticated attacker to read or delete arbitrary files on the target server, potentially leading to sensitive information disclosure or denial of service.
Strike rConfig search.crud.php OS Command Injection	CVE: 2020-10879 CWE: 74	This strike exploits a OS Command Injection vulnerability in the rConfig server. The vulnerability is in the 'nodeId' parameter in the 'search.crud.php' module, due to failure to properly sanitize the user-supplied input. A remote, authenticated attacker can create a malicious HTTP request resulting in arbitrary command execution on the target system with the privileges of the user running the web server.

Name	References	Description
Strike Tenda AC1900 Router AC15 Model Devicename Remote Code Execution Vulnerability	CVE: 2020-10987 CWE: 78	This strike exploits a remote code execution vulnerability in Tenda AC1900 Router AC15 Model. The vulnerability is due to improper validation of the input parameter deviceName and this value is directly passed to a doSystemCmd function. An unauthenticated attacker could exploit this vulnerability by sending a malicious shellcode through the deviceName parameter and might result in remote code execution.
Strike Microsoft SharePoint DataSet Object Remote Code Execution	CVE: 2020-1147	This strike exploits a remote code execution vulnerability that affects Microsoft .NET Framework, SharePoint, and Visual Studio. This vulnerability is due to improper validation of the source markup of XML file input. An attacker could exploit this vulnerability by enticing a user to open a crafted document or sending maliciously crafted XML content to a server that processes the XML data using the vulnerable library. Successful exploitation allows the attacker to run arbitrary code in the security context of the .NET application.
Strike WordPress Duplicator Plugin Path Traversal	CWE: 22 CVE: 2020-11738	This strike exploits an unauthenticated directory traversal vulnerability in WordPress Duplicator plugin. This vulnerability is due to the implementation of a pair of functions, duplicator_download and duplicator_init. The functions are hooked into init, which are executed when every WordPress page is loaded, whether the user is logged in or not. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the WordPress site. Successful exploitation of this vulnerability could lead to arbitrary file read with the web server privileges.
Strike Apache Airflow Command Injection	CWE: 78 CVE: 2020-11978	This strike exploits remote code/command injection vulnerability in Apache Airflow. This vulnerability was discovered in one of the example DAGs(Directed Acyclic Graph) shipped with Airflow which would allow any user to run arbitrary commands as the user running airflow worker/scheduler(depending on the executor in use). A remote unauthenticated attacker can exploit this vulnerability by sending a crafted request to apache airflow. *NOTE: When running this strike in OneArm mode, first it searches for the example_trigger_target_dag on the target server. If found, then it unpauses the example dag and then creates a DAG(it is a collection of all the tasks that one may want to run), which in this case is creation of a file /tmp/test .
Strike TP-Link NC2XX sysname OS Command Injection	CWE: 78 CVE: 2020-12109	A remote command injection exists in multiple TP-Link Cloud Camera devices (NC2XX) due to lack of user input sanitization. By sending a crafted 'sysname' POST parameter to '/setsysname.cgi' path, a remote authenticated commander may execute arbitrary commands on the target system.
Strike rConfig vendors.crud.php Arbitrary File Upload Vulnerability	CVE: 2020-12255	This strike exploits an arbitrary file upload vulnerability in the rConfig Network Device Configuration Tool. The vulnerability resides in the improper validation of the HTTP multipart/form-data request parameter vendorLogo within the vendors.crud.php script. Exploiting this vulnerability allows a remote authenticated attacker to upload malicious files, potentially leading to arbitrary code execution under the security context of the affected service.

Name	References	Description
Strike rConfig Network Device Configuration Tool devicemgmt.php Cross-Site Scripting	CWE: 79 CVE: 2020-12256	This strike exploits a cross-site scripting vulnerability in rConfig Network Device Configuration Tool. The vulnerability is due to improper validation of the user-supplied request parameter deviceId by devicemgmt.php. A remote attacker could exploit this vulnerability by enticing a victim to open a link or a web page. Successful exploitation could result in the execution of script code in security context of the target users browser.
Strike rConfig Network Device Configuration Tool configDevice.php Cross-Site Scripting	CWE: 79 CVE: 2020-12259	This strike exploits a cross-site scripting vulnerability in rConfig Network Device Configuration Tool. The vulnerability arises from inadequate validation of the 'rid' request parameter in configDevice.php. A remote attacker could exploit this vulnerability by enticing a victim to open a link or a web page. If successfully exploited, this could lead to the execution of script code within the security context of the targeted user's browser.
Strike Roundcube Webmail im_convert_path RCE Vulnerability	CWE: 78 CVE: 2020-12641	This strike exploits remote code execution vulnerability in Roundcube webmail. The vulnerability is due to the im_convert_path configuration setting, which allows a remote, unauthenticated attacker with access to the Roundcube installer to inject system commands. These commands execute whenever a user opens an email containing a "non-standard" image. Successful exploitation could lead to arbitrary command execution.
Strike Centreon RRDdatabase_status_path Command Injection Vulnerability	CVE: 2020-13252	This strike targets a command injection vulnerability in the Centreon Web Application. The issue arises from improper validation of the `RRDdatabase_status_path` parameter in HTTP requests. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary commands on the server with the privileges of the web server process.
Strike phpGACL acl_admin action parameter Reflected Cross-Site Scripting	CWE: 79 CVE: 2020-13562	This strike exploits a reflected cross-site scripting vulnerability in phpGACL. This vulnerability is due to insufficient validation of action parameter in acl_admin.php. A remote attacker can exploit this vulnerability by enticing a target user into clicking a malicious link. Successful exploitation could result in code-execution, depending on javascript payload embedded in the malicious link. *NOTE: This strike simulates interaction with OpenEMR which uses the vulnerable version of phpGACL, which makes OpenEMR vulnerable. When running this strike in OneArm mode, the credentials used will be admin/pass and requests will be sent to /someuri instead of /openemr/someuri(default) since the OpenEMR docker used is configured that way.
Strike phpGACL acl_admin acl_id parameter Reflected Cross-Site Scripting	CWE: 79 CVE: 2020-13564	This strike exploits a reflected cross-site scripting vulnerability in phpGACL. This vulnerability is due to insufficient validation of acl_id parameter in acl_admin.php. A remote attacker can exploit this vulnerability by enticing a target user into clicking a malicious link. Successful exploitation could result in code-execution, depending on javascript payload embedded in the malicious link. *NOTE: This strike simulates interaction with OpenEMR which uses the vulnerable version of phpGACL, which makes OpenEMR vulnerable. When running this strike in OneArm mode, the credentials used will be admin/pass and requests will be sent to /someuri instead of /openemr/someuri(default) since the OpenEMR docker used is configured that way.

Name	References	Description
Strike Wordpress Plugin BBPress Unauthenticated Privilege Escalation	CWE: 269 CVE: 2020-13693	An authentication bypass vulnerability exists in the bbPress Wordpress plugin. The vulnerability is due to lack of validation on user authorization requests. A remote unauthorized attacker can exploit this vulnerability by sending a crafted HTTP POST request to the system. Successful exploitation results in creating a user with full privileges ('Keymaster' role).
Strike Apache Kylin REST API Command Injection Vulnerability	CVE: 2020-13925	This strike exploits a command injection vulnerability in Apache Kylin. The vulnerability resides in the diag REST API endpoint, specifically in the DiagnosisService class, where user-supplied input is insufficiently validated. An authenticated remote attacker could leverage this flaw by sending crafted HTTP requests, leading to arbitrary command execution on the server.
Strike Apache Unomi OGNL MVEL2 Remote Command Execution	CWE: 20 CVE: 2020-13942	This strike exploits a remote command execution vulnerability found in Apache Unomi. The vulnerability is due to the lack of input validation of Object Graph Navigation Library (OGNL) and MVEL2 for raw user input. The vulnerability can be exploited by an unauthenticated attacker crafting a malicious HTTP POST request. Successful exploitation may result in executing arbitrarily code within the context of the user running the web service.
Strike Apache ActiveMQ Web Console message.jsp Cross-Site Scripting	CWE: 79 CVE: 2020-13947	This strike exploits an cross-site scripting vulnerability in Apache ActiveMQ. The vulnerability is due to insufficient validation of the JMSDestination parameter to message.jsp in the web console. A remote attacker could exploit this vulnerability by enticing a target user to open a malicious crafted link or web page. Successful exploitation could result in code-execution, depending on javascript payload embedded in the malicious link. *NOTE: In OneArm mode, the credentials used for authorization will be admin/admin.
Strike Apache OpenMeetings NetTest Denial of Service	CWE: 835 CVE: 2020-13951	This strike exploits a denial of service vulnerability in Apache OpenMeetings 4.0.0 - 5.0.0. The vulnerability is caused by a lack of rate limiting on NetTest. A remote, unauthenticated attacker can send a large number of requests to the server resulting in network exhaustion and denial of service.
Strike Oracle Business Intelligence Enterprise Edition Path Traversal	CWE: 22 CVE: 2020-14864	This strike exploits a directory traversal vulnerability in Oracle Business Intelligence Enterprise Edition. This vulnerability is due to the getPreviewImage function which is used to get the preview image of a previously uploaded theme logo. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request by manipulating the previewFilePath URL parameter. Successful exploitation of this vulnerability could allow an attacker to read sensitive files, execute arbitrary code, or gain unauthorized access to the system.

Name	References	Description
Strike Oracle WebLogic Server console Authentication Bypass	CWE: 20 CVE: 2020-14882 EXPLOITDB : 48971	This strike exploits an authentication bypass vulnerability in Oracle WebLogic Server product of Oracle Fusion Middleware (component: Console). The vulnerability is due to improper configuration of the Path Traversal blacklist of the server URL in the handler class of the WebLogic HTTP access. A remote, unauthenticated attacker can bypass authentication of the administrator console component by sending a simple HTTP GET request to a double-encoded endpoint containing the Console Portal page. Successful exploitation may result in arbitrary command execution in the context of the server process.
Strike Oracle WebLogic Server Remote Code Execution	CWE: 287 CVE: 2020-14883 EXPLOITDB : 48971	This strike exploits an authentication bypass vulnerability in Oracle WebLogic Server. The vulnerability arises from improper validation of user-supplied data sent via HTTP. A remote, unauthenticated attacker can exploit this vulnerability by sending commands through an MVEL expression under the handle of the com.tangosol.coherence.mvel2.sh.ShellSession class. Successful exploitation could allow the attacker to execute arbitrary code on the affected system.
Strike KingComposer plugin for WordPress Cross Site Scripting	CVE: 2020-15299 CWE: 79	This strike exploits a reflected cross-site scripting vulnerability in KingComposer plugin through 2.9.4 for WordPress. The vulnerability takes advantage of kc-online-preset-data parameter to send base64 encoded Javascript. A remote, unauthenticated attacker can exploit this vulnerability by sending a POST request to wp-admin/admin-ajax.php with the action parameter set to kc_install_online_preset. As such, if an attacker used base64-encoding on a malicious payload, and tricked a victim into sending a request containing the payload in the kc-online-preset-data parameter, that malicious payload would be decoded and executed in the victim's browser.
Strike Ivanti MobileIron Remote Code Execution Vulnerability	CWE: 706 CVE: 2020-15505	This strike exploits a remote code execution vulnerability in MobileIron products. The vulnerability exists in a Tomcat Web Service that deserializes user input using the Hessian format. This unsafe deserialization allows malicious input to be executed, leading to potential remote code execution. Attackers can leverage the inconsistency between Apache and Tomcat to bypass access controls and execute malicious payloads by exploiting deserialization vulnerabilities in the Hessian format. Successful exploitation of this vulnerability could allow a remote, unauthenticated attacker to execute arbitrary code on the affected system.
Strike Nagios XI ajaxhelper Command Injection	CWE: 78 CVE: 2020-15901	This strike exploits a command injection vulnerability in the 'ajaxhelper.php' script for Nagios XI. The flaw is due to the insufficient validation of the opts parameter in the 'ajaxhelper.php' script. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the Nagios user on the target server. Note: This strike assumes that the attacker is authenticated and the Cookie and NSP fields are known.
Strike Advantech iView DeviceTreeTable exportTaskMgrRepo rt Directory Traversal	CWE: 22 CVE: 2020-16245	This strike exploits a directory traversal vulnerability in Advantech iView. The vulnerability is due to improper handling of user-supplied path in HTTP requests. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in arbitrary file read, or arbitrary code execution in the security context of SYSTEM.

Name	References	Description
Strike SaltStack Salt API SSH Client Command Injection	CWE: 78 CVE: 2020-16846	This strike exploits a command injection vulnerability in the SSH client for Salt API component of SaltStack Salt. Specifically, when a POST request is made to the rest_cherrypy service the ssh_port parameter is not properly sanitized. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the root user. This flaw can also be exploited by unauthenticated attacker when combining it with CVE-2020-25592. Note: This strike simulates the unauthenticated attacker behaviour.
Strike Microsoft Exchange Server DlpUtils AddTenantDlpPolicy Remote Code Execution	CWE: 94 CVE: 2020-16875	A remote code execution vulnerability exists in Microsoft Exchange Server due to improper validation of cmdlet arguments. A remote authenticated attacker can exploit this vulnerability by running a particular cmdlet with crafted arguments against a vulnerable Exchange server. Successful exploitation could result in the execution of arbitrary commands as SYSTEM.
Strike Fuel CMS Col Parameter SQL Injection Vulnerability	CWE: 89 CVE: 2020-17463	This strike exploits an SQL injection vulnerability in Fuel CMS. This vulnerability lies in the parameter col in permission/items, logs/items, pages/items, navigation/items. An authenticated attacker can exploit this vulnerability by crafting a specially crafted SQL payload. Successful exploitation of this vulnerability could lead to unauthorized access, data leakage and data manipulation.
Strike vBulletin widget_tabbedcontent_tab_panel Remote Code Execution	CVE: 2020-17496	A server-side template injection vulnerability that leads to remote code execution exists in vBulletin due to a logic bug in the patch for CVE-2019-16759. By exploiting it, a remote unauthenticated attacker may execute arbitrary code using server's PHP engine.
Strike Artica Web Proxy apikey Parameter SQL Injection	CWE: 89 CVE: 2020-17506	This strike exploits an SQL injection vulnerability in Artica Web Proxy. This vulnerability is due to improper validation of the apikey parameter of the fw.login.php page. An attacker can send a crafted HTTP request with SQL commands in the vulnerable parameter allowing remote code execution to occur.
Strike Apache Flink FileUploadHandler Arbitrary File Upload	CWE: 22 CVE: 2020-17518	This strike exploits a file upload vulnerability in Apache Flink. The vulnerability is due to insufficient input validation while uploading files in the FileUploadHandler class. A remote, unauthenticated attacker can exploit this vulnerability by submitting a crafted request to the target server results in the writing of an arbitrary file to any location writable by the target server. *NOTE: When running this strike in OneArm mode, a randomly generated file is uploaded in the /tmp directory of the target machine .
Strike Apache Flink JobManager CustomLogHandler Directory Traversal	CWE: 552 CVE: 2020-17519	This strike exploits a directory traversal vulnerability in Apache Flink. The vulnerability is due to insufficient validation of user supplied file path in JobManagerCustomLogHandler class. An unauthenticated remote attacker can exploit the vulnerability by sending a specially-crafted request to the target server. Successful exploitation results in potentially sensitive file-data being returned in the response from server. *NOTE: When running this strike in OneArm mode, the strike attempts to read data from a potentially sensitive file (/etc/passwd or /etc/fstab).

Name	References	Description
Strike Apache Struts ONGL Remote Code Execution	CWE: 94 CVE: 2020-17530	A remote command execution vulnerability exists in Apache Struts framework as a result of no sanitization of user supplied data. By sending a crafted request, a remote attacker may execute arbitrary OS commands with the server privilege.
Strike Apache Kylin-migrate API OS Command Injection	CWE: 78 CVE: 2020-1956	A command injection vulnerability exists in in Apache Kylin project versions 2.3.0-2.3.2, 2.4.0-2.4.1, 2.5.0-2.5.2, 2.6.0-2.6.4 and 3.0.0. The vulnerability is due to lack of validation for user-supplied input to 'migrate' REST API endpoint. A remote authenticated attacker may execute arbitrary commands by sending a crafted POST request.
Strike Palo Alto Networks Management Interface Command Injection	CVE: 2020-2038 CWE: 78	This strike exploits a management interface command injection vulnerability in Palo Alto Networks PAN-OS. This vulnerability is due to insufficient filtering of the user input in the execute method of the RestApi Class. A remote authenticated attacker can exploit this vulnerability to execute arbitrary OS commands with root privileges. Note: In one_arm this strike simulates the attack using a fixed API key.
Strike PHP-Fusion Downloads php Command Injection	CWE: 269 CVE: 2020-24949	This strike simulates a command injection vulnerability in PHP-Fusion. The vulnerability is due to insufficient validation of HTTP request parameters in downloads.php. A remote unauthenticated attacker could exploit this vulnerability by sending an crafted HTTP request to the vulnerable server. Successful exploitation of this vulnerability could allow the attacker to execute command in the security context of the running server.
Strike Advantech R-SeeNet device_position.php SQL Injection Vulnerability	CVE: 2020-25157	This strike exploits a SQL injection vulnerability in Advantech R-SeeNet. The vulnerability exists due to insufficient validation of the device_id parameter in the device_position.php file. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted HTTP requests, potentially leading to the retrieval of sensitive information from the database.
Strike WordPress File Manager connector_minimal.php Improper Access Control	CWE: 434 CVE: 2020-25213	This strike exploits an improper access control vulnerability in the File Manager plugin for WordPress. The vulnerability arises from inadequate access control for the connector_minimal.php file during file uploads. This allows an unauthenticated attacker to upload arbitrary files, including potentially malicious PHP files, posing a risk of executing arbitrary code. A remote, unauthenticated attacker could exploit this vulnerability by submitting a carefully crafted request to a WordPress server with the File Manager Plugin installed. Successful exploitation could lead to the unauthorized upload of arbitrary files, potentially resulting in the execution of arbitrary code within the security context of the WordPress server.
Strike D-Link DNS-320 system_mgr.cgi Command Injection	CVE: 2020-25506 CWE: 78	This strike exploits a Command Injection vulnerability in D-Link DNS-320 FW. The vulnerability is due to the f_ntp_server parameter, which is not Sanitized successfully before being used. A remote, unauthenticated attacker could exploit this vulnerability by injecting the commands into the f_ntp_server parameter, which leads to arbitrary command execution. Successful exploitation could allow the attacker to execute arbitrary code on the affected device.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike D-Link DSR-250N Denial of Service	CWE: 284 CVE: 2020-26567	This strike exploits a vulnerability inside D-Link Wireless N Unified Service Routers (DSR-250N) 3.12 that can cause a denial of service attack. The device which allows unauthenticated attackers in the same local network to execute a CGI script which reboots the device. The attack can be triggered without authentication.
Strike Ruckus IoT Controller Web UI OS Command Injection	CWE: 862 CVE: 2020-26878	An OS command injection vulnerability exists in Ruckus IoT Controller 1.5.1.0.21 and prior due to lack of user input validation. The vulnerability exists in the '/service/v1/createUser' endpoint which is in charge of new users creation. By sending a crafted HTTP POST data, a remote authenticated attacker may execute arbitrary OS commands as the root user.
Strike Ruckus IoT Controller Web UI Authentication Bypass	CWE: 798 CVE: 2020-26879	An authentication bypass vulnerability exists in Ruckus IoT Controller 1.5.1.0.21 and prior. The vulnerability exists due to a hardcoded token used when the 'Authorization' HTTP header has a specific value. By sending a crafted HTTP request, a remote attacker may obtain unauthorized access to the device.
Strike Netgear JGS516PE Devices Missing Function Level Access Control Vulnerability	CVE: 2020-26919 CWE: 306	This strike exploits an improper access control at the function level vulnerability on NETGEAR JGS516PE devices. The vulnerability arises because the publicly accessible "login.html" page lacks restrictions on executing debug actions. A remote unauthenticated attacker can exploit this by sending arbitrary code in debugCmd through post request. Successful exploitation could allow users execute system commands.
Strike Cisco Security Manager AuthTokenServlet Insecure Deserialization	CWE: 502 CVE: 2020-27131	The strike exploits an insecure deserialization vulnerability in Cisco Security Manager. The vulnerability is due to insufficient validation of serialized data, passed via HTTP(S) request to /CSConm/servlet/com.cisco.nm.cmf.servlet.AuthTokenServlet, causing deserialization of untrusted data while having exploitable libraries in the code path. A remote, unauthenticated attacker can exploit this vulnerability by sending a specially crafted serialized object to the target server. Successful exploitation can result in arbitrary code execution as root.
Strike Arcserve D2D getNews External Entity Injection	CWE: 611 CVE: 2020-27858	This strike exploits an XXE or XML External Entity injection vulnerability in Arcserve D2D. The vulnerability arises from inadequate validation of XML data within the getNews method. An unauthenticated remote attacker could exploit this vulnerability by transmitting malicious XML data in HTTP requests to the target server. Successful exploitation may lead to the disclosure of information within the context of SYSTEM.
Strike SolarWinds Network Configuration Manager VulnerabilitySettings Arbitrary File Write	CWE: 22 CVE: 2020-27871	This strike exploits an arbitrary file write vulnerability that has been reported in SolarWinds Network Configuration Manager. The vulnerability is due to insufficient validation of file types for vulnerability announcement data files in VulnerabilitySettings.aspx, combined with a lack of restriction on destination paths. A remote, authenticated attacker can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation results in the writing of an arbitrary file to a location chosen by the attacker, potentially leading to execution of arbitrary code as SYSTEM.

Name	References	Description
Strike Nagios XI do_update_user Stored Cross-site Scripting	CWE: 79 CVE: 2020-27988	A stored cross-site scripting vulnerability exists in Nagios XI versions prior to 5.7.5. The vulnerability is due to insufficient sanitization of username in 'users.php'. A remote authenticated attacker can exploit this vulnerability by sending crafted HTTP request to the server. Successful exploitation could result in arbitrary JavaScript execution on the victim's browser.
Strike Oracle E-Business Suite Advanced Outbound Telephony CVE-2020-2854 Cross-Site Scripting	CWE: 79 CVE: 2020-2854	A cross-site scripting vulnerability has been reported in the Advanced Outbound Telephony component of Oracle E-Business Suite. A remote attacker can exploit this vulnerability by enticing a target user into opening a crafted link. Successful exploitation could result in the execution of script code in security context of the target users browser.
Strike Oracle E-Business Suite Advanced Outbound Telephony Cross-Site Scripting	CWE: 79 CVE: 2020-2871	This strike exploits a cross-site scripting vulnerability in the User Interface of the Advanced Outbound Telephony component in Oracle E-Business Suite. A remote attacker can exploit this vulnerability by enticing a target user into clicking on a crafted link. Successful exploitation could result in the execution of script code in security context of the target users browser.
Strike D-Link DIR-825 Check Browser Buffer Overflow	CWE: 119 CVE: 2020-29557	This strike exploits a Buffer Overflow vulnerability in the web component of D-Link DIR-825. The vulnerability is due to improper handling of GET parameters processed by the mg_get_var function. The function retrieves the data using a fixed buffer size of 512 bytes, but the actual allocated buffer for storing the parameters is only 128 bytes. When the attacker sends a request with data larger than the buffer, it causes an overflow. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request larger than the buffer limit to the target server. Successful exploitation could result in memory corruption.
Strike Zyxel Products Use of Hard-Coded Credentials	CWE: 522 CVE: 2020-29583	This strike exploits an use of Hard-Coded Credentials Vulnerability in Zyxel Multiple Products. This vulnerability is due to an undocumented account (zyfwp) with an unchangeable password. The account is designed to deliver automatic firmware updates to connected access points through FTP. A remote, unauthenticated attacker could exploit this vulnerability to gain unauthorized access to the affected device, potentially leading to further compromise of the network.
Strike Cisco IP Phones Web Server sprintf Denial of Service Vulnerability	CWE: 20 CVE: 2020-3161	This strike exploits a stack-based buffer overflow vulnerability in Cisco IP Phones. The vulnerability is due to a lack of proper input validation in HTTP requests. The libHTTPService.so library processes parameters from the /deviceconfig/setActivationCode endpoint using sprintf without checking their length, allowing an attacker to overflow the stack-based buffer. This can cause a device crash or enable remote code execution. A remote, unauthenticated attacker could exploit this by sending a crafted HTTP request to the web server of a targeted device. A successful exploitation could allow an attacker to reload an affected IP phone, causing denial of service, or ultimately result in remote code execution with root privileges.

Name	References	Description
Strike Cisco UCS Director ApplianceStorageUtil Directory Traversal	CWE: 22 CVE: 2020-3239	A directory traversal vulnerability exists in Cisco UCS Director. The vulnerability is due to insufficient validation of user input within 'ApplianceStorageUtil' class. A remote authenticated attacker can exploit the vulnerability by sending malicious requests to the target server. Successful exploitation could result in the arbitrary file write and remote code execution under the security context of web server.
Strike Cisco UCS Director Directory Traversal Vulnerability	CVE: 2020-3251	This strike exploits a directory traversal vulnerability in Cisco UCS Director. The vulnerability exists due to insufficient validation of user input within the MyCallable class when processing file upload requests. A remote authenticated attacker could leverage this flaw to write arbitrary files to the server, potentially leading to remote code execution under the web server's security context.
Strike Cisco ASA and FTD Web Services Path Traversal	CVE: 2020-3452 CWE: 22	This strike exploits a Path Traversal vulnerability in web services interface of Cisco Adaptive Security Appliance (ASA) and Firepower Threat Defense (FTD). The vulnerability is due to improper input validation of URLs in HTTP requests processed by the device. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request containing directory traversal character sequences to an affected device. Successful exploitation allows the attacker to view arbitrary files within the web services file system on the targeted device.
Strike Nagios XI Manage Plugins Command Injection	CWE: 78 CVE: 2020-35578	This strike exploits a command injection vulnerability in the admin webpage 'monitoringplugins.php' script for Nagios XI. The flaw is due to the insufficient validation of the 'uploadedfile' multipart filename. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the Nagios user on the target server.
Strike Webmin Package Updates update.cgi Command Injection	CWE: 78 CVE: 2020-35606	This strike exploits a command injection vulnerability in Webmin. The vulnerability is due to the insufficient validation of input in the Package Updates module. A remote attacker could exploit this vulnerability by sending a crafted request to the target system. Successful exploitation of this vulnerability could result in arbitrary command execution on the target system.
Strike Twitter TwitterServer HistogramQueryHandler Cross-Site Scripting	CWE: 79 CVE: 2020-35774	This strike exploits a reflected XSS vulnerability in twitter-server. This vulnerability is due to insufficient validation on user supplied input in the /admin/histograms API method. A remote unauthenticated attacker can exploit this vulnerability by enticing a target user into clicking a malicious link. Successful exploitation could result in code-execution in the context of the browser.
Strike Cisco Adaptive Security Appliance and Firepower Threat Defense Cross-Site Scripting	CVE: 2020-3580 CWE: 79	This strike exploits a cross-site scripting (XSS) vulnerability in Cisco Adaptive Security Appliance and Cisco Firepower Threat Defense. The vulnerability is due to improper input validation of web content within the WebVPN functionality of these devices. An unauthenticated, remote attacker could exploit this flaw to launch XSS attacks against users of the web services interface. If successfully exploited, the vulnerability could result in session hijacking or theft of sensitive information.

Name	References	Description
Strike OpenEMR Backup php Command Injection	CWE: 78 CVE: 2020-36243	This strike exploits a command injection vulnerability in OpenEMR. This vulnerability is due to insufficient sanitization for the user-supplied data in the backup.php. A remote authenticated attacker can exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary command execution in the security context as web server. *NOTE: When running this strike in OneArm mode, the requests will not be sent to /openemr/someuri , instead will be sent to /someuri , since the openemr server docker used, is configured that way.
Strike VMware Cloud Director Expression Language Authenticated Java template injection	CWE: 74 CVE: 2020-3956	A command injection vulnerability exists in VMware Cloud Director. The vulnerability is due to the lack of sanitization while parsing input passed to 'hostname' parameter within the Smtp configuration form. An authenticated attacker can exploit this vulnerability by crafting a malicious HTTP PUT request. Successful exploitation results in full control of the cloud director platform.
Strike VMware Multiple Products ApplianceSslCertificateService Command Injection	CWE: 77 CVE: 2020-4006	This strike exploits a command injection vulnerability in VMware Workspace One Access, Access Connector, Identity Manager, and Identity Manager Connector. The vulnerability is due to improper validation of user input in the 'san' parameter. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the service running on the target server.
Strike IBM Spectrum Protect Plus hostname Command Injection	CVE: 2020-4211 CWE: 74	This strike exploits a command injection vulnerability in IBM Spectrum Protect Plus. The vulnerability is due to a combination of missing authentication of the hostname uri and a lack of input sanitization for injection or invalid characters in the hostname parameter. When an attacker sends an HTTP POST request to "/emi/api/hostname", command execution can occur.
Strike IBM Spectrum Protect Plus uploadHttpsCertificate Command Injection	CVE: 2020-4241 CWE: 78	This strike exploits a command injection vulnerability in IBM Spectrum Protect Plus. The vulnerability is due to a lack of input sanitization for injection or invalid characters in the filename parameter. When an attacker sends an HTTP POST request to the "/emi/api/uploadhttpscertificate" URI, command execution can occur.
Strike Gila CMS Image Upload Remote Code Execution	CWE: 434 CVE: 2020-5514	This strike exploits a remote code execution vulnerability in Gila CMS. The vulnerability is due to improper validation of user supplied files during image upload. An attacker can cause a file write to the tmp folder that is not an image by requesting a thumbnail of a remote non-image file and subsequently requesting the written file, enabling the creation and execution of arbitrary PHP script files. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the targeted server. Successful exploitation of the vulnerability could lead to arbitrary code execution under the security context of the service.

Name	References	Description
Strike Plex Media Server unpickle Dict Insecure Deserialization	CVE: 2020-5741 CWE: 502	This strike exploits an insecure deserialization vulnerability in Plex Media Server. The vulnerability is due to the unsafe deserialization of Dict files, which are unpickled without validation when loaded for a given plugin. An authenticated attacker can remotely deliver a malicious Dict file via the camera upload feature. By setting the Windows-only Plex variable LocalAppDataPath to the newly created photo library, the deserialization process is triggered, potentially leading to remote code execution.
Strike Nagios XI mibs Command Injection	CWE: 78 CVE: 2020-5791	This strike exploits a command injection vulnerability in the 'mibs.php' script for Nagios XI. The flaw is due to the insufficient validation of the file parameter in the 'mibs.php' script. The flaw may be exploited by an authenticated attacker to execute arbitrary code in the context of the Nagios user on the target server. Note: This strike assumes that the attacker is authenticated and the Cookie and NSP fields are known.
Strike Multiple F5 BIG-IP products Directory Traversal	CWE: 94 CVE: 2020-5902 EXPLOITDB : 48642 EXPLOITDB : 48643	This strike exploits a directory traversal vulnerability in multiple F5 BIG-IP products. The vulnerability is due to improper handling of user-supplied path in HTTP requests. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in arbitrary file read, write or remote code execution in the security context of ROOT.
Strike Google Chrome AudioArray Allocate Data Race	CWE: 119 CVE: 2020-6388 GOOGLE: 1999	This strike exploits a vulnerability in Google Chrome. Specifically, an out of bounds memory access occurs when the AudioArray::Allocate function is invoked in a specific manner. When this happens a denial of service condition, or potentially remote code execution, may occur.
Strike Google Chrome USB OnServiceConnectionError Use After Free	CWE: 416 CVE: 2020-6541 GOOGLE: 2068	This strike exploits a vulnerability in Google Chrome. Specifically, javascript can be crafted in such a way that the 'OnServiceConnectionError' function calls 'Resolve' which invokes a user-defined function. If this user function calls USB::getDevices an invalid loop iterator is set. When this loop cycles, a use after free condition can occur. When this happens a denial of service, or potentially remote code execution, may be possible.
Strike Google Chrome MediaElementEvent Listener UpdateSources Use-After-Free	CWE: 416 CVE: 2020-6549 GOOGLE: 2063	This strike exploits a vulnerability in Google Chrome. Specifically, a Use-After-Free condition occurs when the MediaElementEventListener::UpdateSources function is invoked in a specific manner. When this happens a denial of service condition, or potentially remote code execution, may occur.

Name	References	Description
Strike Eaton Intelligent Power Manager system_srv Command Injection	CWE: 78 CVE: 2020-6651	A command injection vulnerability exists in Eaton Intelligent Power Manager 1.67 and prior, due to lack of user input sanitization. An authenticated remote attacker may execute arbitrary OS commands as a superuser by providing a crafted filename parameter when uploading a configuration file.
Strike dotCMS CMSFilter assets Access Control Weakness	CWE: 22 CVE: 2020-6754	An access control weakness has been reported in the dotCMS content management system. The vulnerability is due to insufficient path validation in the CMSFilter class, if the dotCMS installation stores its assets under the tomcats webapps/ROOT/assets directory. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request to the targeted server. Successful exploitation of this vulnerability could allow the attacker to access restricted resources or execute arbitrary code in the security context of the target service.
Strike Mozilla Firefox ReadableStreamCloseInternal Out of Bounds Access	CWE: 125 CVE: 2020-6806 GOOGLE: 2005	This strike exploits a vulnerability in Spidermonkey, the Javascript engine of Mozilla Firefox. An attacker can craft Javascript promise resolutions in such a way that make it possible to cause an out-of-bounds read off the end of an array resized during script execution. This can lead to a denial of service or potentially allow for remote code execution to occur.
Strike Liferay Portal JSON Web Service Insecure Deserialization Vulnerability	CVE: 2020-7961 CWE: 502 EXPLOITDB : 48332	This strike exploits an insecure deserialization vulnerability in Liferay Portal. The vulnerability is due to improper sanitization of user supplied input. Exploiting this vulnerability could allow remote, unauthenticated attackers to execute arbitrary code on the target server in the context of the user running the server.
Strike Intellian Aptus Web libagent.cgi OS Command Injection	CWE: 78 CVE: 2020-7980	A remote command injection vulnerability exists in Intellian Aptus Web due to lack of user authentication when handling HTTP CGI requests. By sending a crafted JSON file with a POST request, a remote unauthenticated attacker may execute arbitrary system commands as the system's superuser.
Strike Ruby on Rails locals render Remote Code Execution	CWE: 94 CVE: 2020-8163	A remote code execution vulnerability exists in Ruby on Rails versions 5 < 5.0.1 and 4 < 4.2.11.2, due to lack of user input validation. The vulnerability manifests itself whenever the 'locals' value for a 'render' call is set to 'params' value. Remote attackers may exploit applications containing the up-mentioned pattern by sending a crafted HTTP request to obtain arbitrary code execution.
Strike Citrix Application Delivery Controller Authorization Bypass via pcidss.php report Function	CWE: 284 CVE: 2020-8193	An authorization bypass vulnerability exists in Citrix Application Delivery Controller (ADC) and Gateway. This vulnerability can be triggered by calling the function report() in the PHP pcidss.php script. The flaw may be exploited by an unauthenticated attacker to access certain protected URL endpoints.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Citrix Application Delivery Controller Information Disclosure via file_download Function	CWE: 20 CVE: 2020-8195	An information disclosure vulnerability exists in Citrix Application Delivery Controller (ADC) and Gateway. This vulnerability can be triggered by calling the function file_download() in the PHP rapi.php script. The flaw may be exploited by an authenticated attacker to access sensitive data. This flaw can also be exploited by unauthenticated attacker when combining it with CVE-2020-8193.
Strike Squid Reverse Proxy Host Header Buffer Overflow	CWE: 119 CVE: 2020-8450	A stack-based buffer overflow vulnerability exists in Squid before 4.10 due to incorrect buffer management, when acting as a reverse proxy. By sending a crafted HTTP request with a host string longer than 255 characters in the 'Host' header, a remote attacker may achieve remote code execution on the target host.
Strike Trend Micro InterScan Web Security Virtual Appliance Password Command Injection	CWE: 78 CVE: 2020-8466	This strike exploits a command injection vulnerability in Trend Micro InterScan Web Security Virtual Appliance. The vulnerability is due to improper validation of user-supplied data in HTTP requests. The vulnerability is due to failure to validate the parameter 'passwd' for command injection characters. A remote, unauthenticated attacker can exploit the vulnerabilities by sending a malicious request to the target server. Successful exploitation of these vulnerabilities could allow arbitrary command execution on the target server in the security context of iscan account.
Strike Trend Micro Apex One and OfficeScan Directory Traversal	CWE: 23 CVE: 2020-8470	This strike exploits a directory traversal vulnerability in Trend Micro Apex One and OfficeScan. The vulnerability is due to a lack of proper validation of user-supplied filename in BinaryDataBlock parameter when handling requests to cgiLog.exe for CMDHL_SET_SPYWARELOG and CMDHL_SET_SPYWARE_BACKUP_MANIFEST commands. An attacker, without authentication, could potentially exploit this vulnerability by sending a carefully crafted request to the target server. Successful exploitation in the worst case could lead to deletion of arbitrary file under the security context of SYSTEM.
Strike DrayTek Vigor keyPath OS Command Injection	CWE: 74 CVE: 2020-8515	An unauthenticated remote command injection vulnerability exists in DrayTek Vigor2960 1.3.1_Beta, Vigor3900 1.4.4_Beta, Vigor300B 1.3.3_Beta, 1.4.2.1_Beta and 1.4.4_Beta routers, due to lack of user input sanitization. By sending a crafted 'keyPath' HTTP parameter, a remote unauthenticated attacker may execute commands as the system's superuser.
Strike Horde Webmail data.php Code Injection Remote Code Execution	CWE: 94 CVE: 2020-8518 EXPLOITDB : 48215	A PHP code injection vulnerability exists in Horde Groupware Webmail Edition 5.2.22 due to lack of user-supplied data sanitization. Remote authenticated attackers may send a crafted 'quote' parameter in a HTTP request to 'mnemo/data.php' to achieve PHP code execution.

Name	References	Description
Strike Trend Micro Apex One and OfficeScan Directory Traversal CVE 2020-8599	CWE: 434 CVE: 2020-8599	This strike exploits a directory traversal vulnerability in Trend Micro Apex One and OfficeScan. The vulnerability is due to improper validation of user-supplied file name in the X_DTAS_Archive_Filename HTTP header when handling a request for sample file upload. Since a remote unauthenticated attacker can control both the file name and file content, this directory traversal vulnerability could allow the attacker to modify executable files in the target system, which could then lead to remote code execution in the context of IUSR account.
Strike PlaySMS Server-Side Template Injection	CVE: 2020-8644 CWE: 94	This strike exploits a Server Side Template Injection vulnerability in PlaySMS. The vulnerability is due to improper sanitization of user supplied input. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request. Successful exploitation allows the attacker to execute remote code under the context of the running process.
Strike EyesOfNetwork autodiscovery Privilege Escalation	CWE: 269 CVE: 2020-8655	This strike exploits a privilege escalation vulnerability in the web component of EyesOfNetwork. The vulnerability arises from improper sudoers configuration, which allows the apache user to run arbitrary commands as root via a crafted NSE (Nmap Scripting Engine) script for nmap. A remote authenticated attacker can exploit this vulnerability by crafting a specific NSE script for nmap. Successful exploitation of this vulnerability can lead to complete control over the affected system. This vulnerability is chained with CVE-2020-8656, which enables the creation of new user credentials. In this CVE these credentials are used to log in and exploit the privilege escalation flaw.
Strike Pi-hole Web DHCP Static Lease Remote Code Execution	CWE: 78 CVE: 2020-8816	This strike exploits a command injection vulnerability in the web component of Pi-hole. The vulnerability is due to improper input validation. A remote, authenticated attacker could exploit this vulnerability by configuring a DHCP static lease to hold malicious command in the MAC address field. Successful exploitation could result in arbitrary command execution under the security context of the root user.
Strike Webmin log_parser.pl Stored Cross-Site Scripting	CWE: 74 CVE: 2020-8821	A stored XSS vulnerability exists in Webmin 1.941 and earlier, affecting the Command-Shell module. The flaw is due to lack of HTML character escaping when rendering log entries and is located in 'shell/log_parser.pl' script. An authenticated remote attacker may send a crafted POST body to obtain arbitrary JavaScript execution on a target user's browser.
Strike ZyXEL NAS weblogin.cgi OS Command Injection	CWE: 78 CVE: 2020-9054	An OS command injection vulnerability exists in multiple ZyXEL products due to insufficient user input sanitization when parsing the 'username' parameter. By sending a crafted HTTP request, a remote unauthenticated attacker may execute arbitrary OS commands as a superuser.

Name	References	Description
Strike TP-Link TL-WR849N cgi OS Command Injection	EXPLOITDB : 48155 CWE: 78 CVE: 2020-9374	An OS command injection flaw exists in TP-Link TL-WR849N due to lack of user input sanitization. The vulnerability resides in router's 'Diagnostics' area, where tests such as 'ping' and 'traceroute' may be performed. By sending a crafted HTTP POST request, a remote unauthenticated attacker may execute arbitrary commands on the target system.
Strike Centreon server_ip field OS Command Injection	CWE: 78 CVE: 2020-9463	This strike exploits a command injection vulnerability in Centreon 19.10. The vulnerability is due to improper validation of the server_ip parameter in a HTTP request. An authenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in arbitrary command execution in the context of the server process.
Strike Apache Tomcat PersistenceManager Insecure Deserialization	CWE: 502 CVE: 2020-9484	An insecure deserialization vulnerability exists in Apache Tomcat. The vulnerability is due to insufficient validation of a cached session file before deserialization. An attacker can exploit this vulnerability by crafting a malicious HTTP request. Successful exploitation results in full control of the target server.
Strike Apache httpd HTTP2 Cache-Digest Header Parsing Memory Corruption	CWE: 444 CVE: 2020-9490	This strike exploits a memory corruption vulnerability in the mod_http2 module of the Apache HTTP server. The vulnerability is due to improper handling of Cache-Digest headers. During base64 decoding of the Cache-Digest header, the function h2_push_diary_digest_set() interprets the first 2 bytes as log2 results. The subsequent calculation of a signed integer N based on these log2 values can result in a negative value, leading to an integer underflow which triggers memory corruption. An attacker could exploit this flaw by sending a specially crafted Cache-Digest header, manipulating variables and triggering an integer underflow, potentially leading to remote code execution on the affected server.
Strike Apache OFBiz XMLRPC Insecure Deserialization	CVE: 2020-9496 CWE: 502	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. The vulnerability is a result of insufficient validation of XML-RPC requests in the SerializableParser class. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to a vulnerable server. Successful exploitation can lead to remote code execution, in the context of the user running the server.
Strike Apple Safari WebKit Incorrect ArithNegate Leads to Out Of Bounds Access	CVE: 2020-9802 GOOGLE: 2020	This strike exploits a vulnerability in Apple Webkit. Specifically, an attacker can craft JavaScript in such a way that Checked and Unchecked ArithNegate operations are incorrectly swapped during Common Subexpression Elimination. This will lead to out-of-bounds memory access on an array after being JIT compiled.
Strike Cisco HyperFlex HX storfs-asup Handling Remote Command Execution	CWE: 78 CVE: 2021-1498	This strike exploits a remote command execution vulnerability in Cisco HyperFlex. The vulnerability is due to improper sanitization of user supplied data. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could lead to execution of arbitrary code in the context of target process.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SonicWall SMA 100 Appliances Stack-Based Buffer Overflow	CWE: 787 CVE: 2021-20038	This strike exploits stack-based buffer overflow vulnerability in SonicWall SMA 100 Appliances. This vulnerability arises from how environment variables are concatenated into a string within mod_cgi.so and also that the attacker-provided QUERY_STRING is not subjected to any type of length check. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted request to the target server. Successfully exploiting this vulnerability could allow attacker to potentially execute code as a 'nobody' user or crash the affected system.
Strike ManageEngine OpManager Remote Directory Deletion	CWE: 22 CVE: 2021-20078	This strike exploits a directory traversal vulnerability in Zoho ManageEngine OpManager builds below 125346. The vulnerability is due to improper handling of user-supplied path in HTTP requests. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in arbitrary file deletion, which could result in a denial of service.
Strike Zoho ManageEngine ServiceDesk Plus Custom Schedules Command Injection Vulnerability	CVE: 2021-20081	This strike exploits an arbitrary command execution vulnerability in Zoho ManageEngine ServiceDesk Plus. The vulnerability resides in the improper validation of user input within the custom-schedules module. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to arbitrary command execution and potential remote code execution under the SYSTEM security context.
Strike Arcadyan Buffalo Firmware Path Traversal	CWE: 22 CVE: 2021-20090	This strike exploits a directory traversal vulnerability in Arcadyan Buffalo Firmware. This vulnerability is due to the improper access permission set for a list of folders and files. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation of this vulnerability could lead to read sensitive files, such as configuration files, credentials, or other sensitive information.
Strike Draytek VigorConnect DownloadFileServlet Path Traversal Vulnerability	CWE: 22 CVE: 2021-20123	This strike exploits a local file inclusion vulnerability in Draytek VigorConnect. The vulnerability exists in the file download functionality of the DownloadFileServlet endpoint. A remote, unauthenticated attacker could leverage this vulnerability to download arbitrary files from the vulnerable server with root privileges.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability cve_2021_20130	CVE: 2021-20130	This strike exploits an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The vulnerability exists due to insufficient validation of uploaded files in the PasswordExpiryAction class. A remote authenticated attacker can leverage this flaw to upload malicious files, potentially leading to remote code execution with SYSTEM privileges.
Strike Adobe Magento DownloadCss.php Cross-site Scripting	CWE: 79 CVE: 2021-21029	A reflected cross-site scripting vulnerability exists in Adobe Magento. The vulnerability is due to insufficient sanitization of a file resource identifier in 'DownloadCss.php'. A remote authenticated attacker can exploit this vulnerability by sending a crafted HTTP request to the server. Successful exploitation could result in arbitrary JavaScript execution in victim's browser.

Name	References	Description
Strike Oracle WebLogic Server JNDI Injection	CWE: 610 CVE: 2021-2109	This strike exploits a JNDI injection vulnerability in Oracle Weblogic Server. This vulnerability is due to improper handling user supplied data. A remote, authenticated attacker can exploit this vulnerability by sending a crafted request to a vulnerable server. Successful exploitation results in the target server retrieving a potentially malicious serialized object from an attacker controlled server which may lead to the execution of arbitrary code under the security context of the affected server. *NOTE: When running this strike in OneArm mode, the oracle weblogic server will attempt to make a ldap request to a ldap listener(JNDI server) running on localhost to retrieve the serialized object.
Strike Oracle E-Business Suite Common Applications Calendar Cross-Site Scripting	CWE: 79 CVE: 2021-2114	This strike exploits a reflected cross-site scripting vulnerability in the Common Applications Calendar component in Oracle E-Business Suite. The vulnerability is due to the use of untrusted user input from requests when constructing HTML output. A remote attacker can exploit this vulnerability by enticing a target user into clicking a malicious link. Successful exploitation could result in code-execution, depending on javascript payload embeeded in the malicious link.
Strike OneDev Platform AttachmentUploadServlet Insecure Deserialization	CWE: 502 CVE: 2021-21242	This strike exploits an insecure deserialization vulnerability in OneDev Platform. The vulnerability is due to insufficient validation of request processed in AttachmentUploadServlet servlet. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted request. Successful exploitation would result in arbitrary code execution without authentication.
Strike OneDev Platform KubernetesResource Insecure Deserialization	CWE: 502 CVE: 2021-21243	This strike exploits an Insecure Deserialization vulnerability in the OneDev Platform. The vulnerability occurs due to an API which exposes two methods that deserialize untrusted data from the request body. These API methods do not enforce any authentication checks so it could allow an unauthenticated attacker to execute arbitrary code on the target system. *NOTE: When running this strike in OneArm mode, the strike sends a DNS request to example.com or creates a new file with some data in the "C://" directory depending on the variant.
Strike OneDev Platform PreAuth Access Token Leak	CWE: 862 CVE: 2021-21246	This strike exploits a lack of authentication vulnerability in OneDev Platform. Attackers can send crafted request to the endpoint /users/{id} where there are no security checks enforced, so it is possible to retrieve arbitrary user details including their Access Tokens. *NOTE: When running this strike in OneArm mode, the strike attempts to read information containing access token for the user with id equals 1.
Strike Git Source Code Management Out-of-Order Checkout Improper Link Resolution	CWE: 59 CVE: 2021-21300	This strike exploits an improper link resolution in the checkout mechanism of Git Source Code Management. An out-of-order checkout triggered by a delayed checkout or checkout-index may result in an improper validation of a file system resource type prior to performing a file write operation. A remote attacker can exploit this vulnerability by enticing a user to clone a malicious repository. Successful exploitation can result in remote code execution in the context of the git process.

Name	References	Description
Strike VMware vCenter vSphere Client Arbitrary File Upload	CWE: 269 CVE: 2021-21972 EXPLOITDB : 49602	This strike exploits a file upload vulnerability in vSphere Client component of VMware vCenter. An remote unauthenticated attacker can send a malicious HTTP POST request to upload an arbitrary file via '/ui/vropspluginui/rest/services/uploadova' api. Successful exploitation may lead to creation and execution of arbitrary files with the context of the NT AUTHORITY\SYSTEM for windows and vsphere-ui user for linux.
Strike VMware View Planner Arbitrary File Upload	CWE: 434 CVE: 2021-21978 EXPLOITDB : 49602	This strike exploits a file upload vulnerability in VMware View Planner. An remote unauthenticated attacker can send a malicious HTTP POST request to upload an arbitrary file via 'logupload' endpoint. Successful exploitation can lead to execution of arbitrary code on the target system with root privileges.
Strike VMware vCenter Server Virtual SAN Code Execution	CWE: 20 CVE: 2021-21985	The vSphere Client (HTML5) contains a remote code execution vulnerability due to lack of input validation in the Virtual SAN Health Check plug-in which is enabled by default in vCenter Server. The flaw may be exploited by an unauthenticated attacker to execute arbitrary code in the context of the service running on the target server.
Strike VMware vCenter Server AsyncTelemetryController Arbitrary File Write	CWE: 434 CVE: 2021-22005	An arbitrary file upload vulnerability exists in VMware vCenter Server. The vulnerability is due to insufficient validation of collector IDs and collector instance IDs in requests handled by the AsyncTelemetryController class. A remote attacker could exploit this vulnerability by sending crafted requests to the target server resulting in execution of arbitrary code by the server.
Strike ExifTool DjVu Remote Code Execution	CWE: 74 CVE: 2021-22204	This strike exploits an improper neutralization of directives in dynamically evaluated code ('eval injection') in ExifTool. An remote unauthenticated attacker can supply a malicious crafted DjVu file to be processed via ExifTool. Successful exploitation may lead to execution of arbitrary code with the context of the user running the ExifTool. Note: This strike exploits GitLab CE which runs the ExifTool internally. GitLab also identifies this same vulnerability with CVE-2021-22205.
Strike GitLab Community and Enterprise Edition Remote Command Execution	CWE: 94 CVE: 2021-22205	This strike exploits a remote code execution vulnerability in GitLab Community and Enterprise Editions. This vulnerability is due to improper validation of image files that are passed to file parser. A remote, authenticated attacker could exploit this vulnerability by sending specially crafted image file to an unspecified endpoint. Successfully exploiting this vulnerability could result in remote command execution on the target system.
Strike Micro Focus Operation Bridge Reporter LogonResource OS Command Injection	CWE: 78 CVE: 2021-22502	This strike exploits an OS Command Injection Vulnerability in Micro Focus OBR. The vulnerability is due to improper sanitization of username parameter. A remote, unauthenticated attacker can exploit this vulnerability by sending crafted http requests containing shell metacharacters to the LogonResource endpoint. Successful exploitation of this vulnerability could lead to remote code execution.

Name	References	Description
Strike Advantech iView CommandServlet Directory Traversal Vulnerability	CVE: 2021-22656	This strike exploits a directory traversal vulnerability in Advantech iView. The vulnerability arises from improper validation of user-supplied input in the CommandServlet Java class. A remote, unauthenticated attacker could leverage this flaw by sending crafted HTTP requests, potentially leading to the disclosure of sensitive files and information on the server.
Strike Advantech iView UserServlet SQL Injection	CWE: 89 CVE: 2021-22658	This strike exploits a SQL injection vulnerability in Advantech iView. The vulnerability is due to improper validation of user-supplied input when processing the request in UserServlet Java class. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in the execution of arbitrary SQL statement on the target server.
Strike Schneider Electric Struxureware Data Center Expert Command Injection Vulnerability	CVE: 2021-22795	This strike exploits a command injection vulnerability in Schneider Electric Struxureware Data Center Expert. The vulnerability exists due to improper sanitization of the "config" parameter in HTTP POST requests to the "/nbc/compress/repository/test" endpoint. A remote, authenticated attacker could leverage this flaw to execute arbitrary commands on the system with root privileges.
Strike Citrix ShareFile Storage Zones Controller NeatUpload Directory Traversal	CVE: 2021-22941 CWE: 284	The vulnerability allows remote attackers to save files to an arbitrary file path under the web root directory in the NeatUpload library of Citrix ShareFile Storage Zones Controller due to improper validation of an ID parameter in file upload requests. Successful exploitation could result in the execution of arbitrary code on the target server.
Strike F5 BIG-IP and BIG-IQ iControl REST Code Execution	CWE: 284 CVE: 2021-22986	This strike exploits an authentication bypass vulnerability in F5 BIG-IP and BIG-IQ products. The vulnerability is due to improper handling of user-supplied authentication token and the loginReference link in HTTP requests. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the server. A successful attack may result in remote code execution in the security context of ROOT.
Strike Joomla mod_breadcrumbs Title Store Cross-Site Scripting	CWE: 79 CVE: 2021-23124	This strike exploits a cross-site scripting vulnerability in Joomla CMS. This vulnerability is due to inadequate input filtering in the title attribute of mod_breadcrumbs. Successful exploitation could result in arbitrary script code being executed in the security context of the browser.
Strike Oracle Business Intelligence BIRemotingServlet Insecure Deserialization Vulnerability	CVE: 2021-2456	This strike exploits an insecure deserialization vulnerability in Oracle Business Intelligence. The vulnerability arises from improper validation of AMF3 objects in requests to the BIRemotingServlet. A remote attacker can leverage this flaw by sending specially crafted AMF packets, leading to arbitrary code execution in the context of the affected server.

Name	References	Description
Strike SaltStack Salt salt wheel pillar_roots write Method Directory Traversal	CWE: 22 CVE: 2021-25282	This strike exploits a directory traversal vulnerability that exists in the WheelClient for Salt API, a component of SaltStack Salt. The vulnerability is due to improper validation of user-supplied input in the pillar_roots.write method. A remote attacker could exploit this vulnerability by sending a crafted HTTP request to the targeted server. Successful exploitation can result in arbitrary file creation and, in the worst case, remote code execution in the context of the root user.
Strike Nagios XI Configwizards Windowswmi Command Injection	CWE: 78 CVE: 2021-25296	This strike exploits a command injection vulnerability in Nagios XI 5.7.5. The vulnerability is due to insufficient input validation of the requests submitted to the Windowswmi.inc.php file. A remote authenticated attacker can exploit this vulnerability by sending a crafted request to the server. Successful exploitation could result in arbitrary command execution with privileges of the web server running on the target system. NOTE - The strike has one-arm support where it tries to connect to a netcat listener with a bash shell running on port 4444 on the vulnerable webserver (Creds - nagiosadmin/1234) itself.
Strike Nagios XI Configwizards Switch Command Injection	CWE: 78 CVE: 2021-25297	This strike exploits a command injection vulnerability in Nagios XI version xi-5.7.5. The vulnerability exists in the file /usr/local/nagiosxi/html/includes/configwizards/switch/switch.inc.php due to improper sanitization of authenticated user-controlled input by a single HTTP request, which can lead to OS command injection on the Nagios XI server. NOTE - The strike has one-arm support where it tries to connect to a netcat listener with a bash shell running on port 4444 on the vulnerable webserver (Creds - nagiosadmin/1234) itself.
Strike Nagios XI Configwizards Cloud-vm Command Injection	CWE: 78 CVE: 2021-25298	This strike exploits a command injection vulnerability in Nagios XI 5.7.5. The vulnerability is due to insufficient input validation of the requests submitted to the Cloud-vm.inc.php file. A remote authenticated attacker can exploit this vulnerability by sending a crafted request to the server. Successful exploitation could result in arbitrary command execution with privileges of the web server running on the target system. NOTE - The strike has one-arm support where it tries to connect to a netcat listener with a bash shell running on port 4444 on the vulnerable webserver (Creds - nagiosadmin/1234) itself.
Strike Nagios XI Web SSH Terminal sshterm Cross-Site Scripting	CWE: 79 CVE: 2021-25299	This strike exploits a cross-site scripting vulnerability in Nagios XI 5.7.5 . This vulnerability is due to improper validation of the url parameter in sshterm.php while accessing the web SSH terminal.A remote attacker can exploit this vulnerability by enticing the user to visit a specially crafted link or page. Successful exploitation could result in arbitrary script code being executed in the security context of the browser.
Strike Apache Druid Remote Code Execution	CWE: 502 CVE: 2021-25646	This strike exploits a deserialization vulnerability in Apache Druid. The vulnerability is due to improper deserialization of a JSON data into Java objects. A remote, unauthenticated attacker could exploit this vulnerability by submitting a specially crafted JSON file which could result in arbitrary command execution.

Name	References	Description
Strike Atlassian Confluence OGNL Remote Code Execution	CWE: 74 CVE: 2021-26084	This strike exploits an OGNL injection vulnerability in the createpage-entervariables resource of Confluence Server and Data Center. The vulnerability is due to improper validation of a parameter in a HTTP POST request. To exploit this vulnerability, a remote, unauthenticated attacker can submit a request with encoded single quote in order to perform an OGNL injection attack. A successful attack can result in arbitrary command execution in the context of the server process.
Strike Atlassian Confluence Information Disclosure	CWE: 862 CVE: 2021-26085	This strike exploits an information disclosure vulnerability in Atlassian Confluence. The vulnerability is due to improper path validation. A remote, unauthenticated attacker could exploit this vulnerability by submitting a specially crafted HTTP request which could result in arbitrary file read.
Strike CMS Made Simple Server-Side Template Injection Vulnerability	CVE: 2021-26120	This strike exploits a server-side template injection vulnerability in CMS Made Simple. The vulnerability exists due to improper validation of user-supplied input in the "name" parameter of the "{function}" tag within the Smarty template engine. A remote, authenticated attacker could leverage this flaw to execute arbitrary code on the affected system, potentially gaining full control over the server.
Strike Microsoft Internet Explorer 9-11 MSHTML Remote Code Execution	CVE: 2021-26411 CWE: 119	This strike exploits a memory corruption vulnerability in the Microsoft Internet Explorer 9 and 11 browsers. The vulnerability is due to improper use of memory in the MSHTML library. An attacker could exploit this vulnerability by convincing a user to open a malicious HTML page, which could lead to remote code execution.
Strike Microsoft Exchange New-DlpPolicy Cmdlet Remote Code Execution Vulnerability	CVE: 2021-26412	This strike targets a remote code execution vulnerability in Microsoft Exchange Server. The issue arises from improper validation of the "commandBlock" tag in DLP policy templates when processing the "ruleParameters" tag. Exploiting this flaw allows an authenticated attacker to execute arbitrary commands with SYSTEM privileges on the affected server.
Strike Microsoft Exchange ProxyLogon Server Side Request Forgery	CVE: 2021-26855 CWE: 918	A server side request forgery exists in multiple versions of Microsoft Exchange Server. The vulnerability resides in 'Microsoft.Exchange.FrontEndHttpProxy.dll' and is due to improper validation of requests for static resources sent to the backend component of the server. A remote unauthenticated attacker may send an HTTP POST request with a crafted 'Cookie' header to access resources that are otherwise accessible only for administrative users.
Strike Microsoft Exchange Server Arbitrary File Write	CWE: 23 CVE: 2021-26858	This strike exploits a path traversal vulnerability which affects Microsoft Exchange Server. The vulnerability is due to insufficient validation of the user provided path. A remote, authenticated attacker can exploit this vulnerability by sending several crafted requests to the target system. Successful exploitation results in remote code execution under the security context as SYSTEM.

Name	References	Description
Strike Apache Druid JDBC Connection Remote Code Execution	CWE: 15 CVE: 2021-26919	This strike exploits a deserialization vulnerability in Apache Druid. The vulnerability is due to missing validation on allowed JDBC connection properties. A remote, unauthenticated attacker could exploit this vulnerability by submitting a crafted JDBC connection URL in a MySQL datasource. Note: This strike contains just the configuration request to the Apache Druid server. This request is used to enforce the Apache Druid to connect to a MySQL server, request some data and deserialize it. The MySQL connection generated by this request is not part of this strike.
Strike Microsoft Exchange FilePathName Arbitrary File Write	CVE: 2021-27065 CWE: 73 EXPLOITDB : 49637	An arbitrary file upload vulnerability exists in Microsoft Exchange Server due to lack of sanitization of 'FilePathName' parameter in Virtual Directory reset requests. A remote authenticated attacker may send crafted JSON HTTP requests to upload a webshell on the target system and execute arbitrary commands as the SYSTEM user.
Strike Netgear ProSAFE NMS300 Arbitrary File Deletion Vulnerability	CVE: 2021-27272	This strike exploits an arbitrary file deletion vulnerability in Netgear ProSAFE NMS300. The vulnerability resides in the ReportTemplateController class, specifically in the clear() method, which fails to properly sanitize directory traversal characters in the path parameter. A remote authenticated attacker could leverage this flaw by sending crafted HTTP requests to delete arbitrary files on the server, potentially leading to denial-of-service conditions.
Strike Netgear ProSAFE NMS300 Post-Authentication Command Injection Vulnerability	CVE: 2021-27273	This strike exploits a command injection vulnerability in Netgear ProSAFE NMS300. The vulnerability exists due to insufficient validation of the "fileName" parameter in the rebootSystem() method of the SettingConfigController class. A remote, authenticated attacker could leverage this flaw by sending specially crafted HTTP requests, leading to the execution of arbitrary commands with SYSTEM privileges.
Strike Netgear ProSAFE NMS300 Unrestricted File Upload Vulnerability	CVE: 2021-27274	This strike exploits an unrestricted file upload vulnerability in Netgear ProSAFE NMS300. The vulnerability resides in the MFileUploadController class, specifically in the uploadFile() method, which fails to properly validate the file type and parameters of uploaded files. A remote attacker could exploit this vulnerability by uploading a malicious file, leading to arbitrary code execution under the security context of SYSTEM.
Strike Yealink Device Management Server-Side Request Forgery	CWE: 78 CVE: 2021-27561	This strike exploits a Server-Side Request Forgery Vulnerability in Yealink Device Management. This vulnerability lies in the /sm/api/v1/firewall/zone/services URI. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation of this vulnerability could lead to command execution in the context of the root user.
Strike Apache Solr ReplicationHandler SSRF Vulnerability	CVE: 2021-27905	This strike exploits a server-side request forgery vulnerability in Apache Solr. The vulnerability is located in the ReplicationHandler's handling of the masterUrl and leaderUrl parameters. Exploiting this vulnerability allows a remote attacker to perform arbitrary file writes, disclose sensitive information, and spoof server conditions.

Name	References	Description
Strike Apache Superset Markdown Component Stored Cross-Site Scripting	CWE: 79 CVE: 2021-27907	This strike exploits a stored cross-site scripting vulnerability in the Markdown component of Apache Superset. This vulnerability is due to insufficient validation of Markdown snippet in a dashboard. A remote authenticated attacker can exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary script execution in the target user's browser.
Strike Apache OFBiz SOAPService XMLRPC Insecure Deserialization	CVE: 2021-29200 CWE: 502	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. The vulnerability is a result of insufficient validation of XML-RPC requests in the UtilObject class. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to a vulnerable server. Successful exploitation can lead to remote code execution, in the context of the user running the server.
Strike Alibaba Nacos AuthFilter Authentication Bypass Vulnerability	CVE: 2021-29441	This strike exploits an authentication bypass vulnerability in Alibaba Nacos. The vulnerability is located in the AuthFilter servlet filter implementation, specifically in the doFilter method of the AuthFilter class. Exploiting this vulnerability allows a remote, unauthenticated attacker to gain unauthorized access to endpoints that typically require authentication.
Strike Ivanti Avalanche imagePath Directory Traversal Vulnerability	CVE: 2021-30497	This strike exploits a directory traversal vulnerability in Ivanti Avalanche. The vulnerability resides in the improper validation of the "imageFilePath" parameter in HTTP requests. A remote, unauthenticated attacker could leverage this flaw to access arbitrary files on the server, potentially leading to the disclosure of sensitive information.
Strike Microsoft HTTP.sys UlpParseAcceptEncoding Remote Code Execution Vulnerability	CWE: 416 CVE: 2021-31166	A use-after-free vulnerability exists in the HTTP Protocol Stack HTTP.sys for Microsoft Internet Information Services. The vulnerability is due to a design weakness in the UlpParseAcceptEncoding method. This vulnerability can be exploited by a remote, unauthenticated attacker by sending a crafted Accept-Encoding header in an HTTP request to the target server. Successful exploitation could lead to remote code execution with kernel privileges or to a denial of service.
Strike Microsoft Exchange MailboxExportRequest Arbitrary File Write	CWE: 22 CVE: 2021-31207	This strike exploits an arbitrary file write vulnerability in Microsoft Exchange. The vulnerability is due to improper handling of MailboxExportRequest commands. An authenticated, remote attacker can exploit this vulnerability by sending a crafted MailboxExportRequest command to the target server. Successful exploitation could result in the writing of an arbitrary file which may be used to facilitate the execution of arbitrary code.
Strike Laravel Ignition Solutions Remote Code Execution	CVE: 2021-3129 CWE: 94	This strike exploits a file upload vulnerability in Laravel Ignition. The issue arises because of the insecure usage of file_get_contents() and file_put_contents() present in the Ignition module. This allows an attacker to inject malicious scripts in the viewFile parameter of the solutions present in the Ignition module. A remote, unauthenticated attacker could exploit this vulnerability by sending a specially crafted request to the target server. Successful exploitation can lead to arbitrary code execution.

Name	References	Description
Strike WebSVN Search.php Command Injection Vulnerability	CVE: 2021-32305	This strike exploits a command injection vulnerability in WebSVN. The vulnerability exists due to improper sanitization of the "search" parameter in requests sent to the search.php endpoint. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary commands with the privileges of the web server on the target system.
Strike SmartStoreNET ForumPost Stored Cross-Site Scripting Vulnerability	CVE: 2021-32608	This strike exploits a stored cross-site scripting vulnerability in SmartStoreNET. The vulnerability resides in the improper handling of BBCode url tags within forum posts. A remote attacker could exploit this flaw by posting maliciously crafted forum messages, leading to arbitrary script execution in the browser of users viewing the affected pages.
Strike Studio-42 elFinder Archive Command Injection Vulnerability	CVE: 2021-32682	This strike exploits a command injection vulnerability in Studio-42 elFinder. The vulnerability resides in the insufficient validation of the "name" parameter when creating an archive in the makeArchive function. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary commands with the privileges of the web server process.
Strike WooCommerce Blocks WordPress Plugin SQL Injection Vulnerability	CVE: 2021-32789	This strike exploits an SQL injection vulnerability in the WooCommerce Blocks WordPress plugin. The vulnerability arises from insufficient input validation in the "calculate_attribute_counts" parameter of the "/wc/store/products/collection-data" API endpoint. A remote, unauthenticated attacker can exploit this flaw by sending crafted HTTP requests, leading to the execution of arbitrary SQL SELECT queries and unauthorized retrieval of database information.
Strike Delta Industrial Automation DIAEnergie Arbitrary File Upload Vulnerability	CVE: 2021-32955	This strike exploits an arbitrary file upload vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability resides in the HandlerPage_KID endpoint due to insufficient input validation on the HtmlId parameter and lack of authentication. A remote, unauthenticated attacker could leverage this flaw to upload malicious files, potentially leading to arbitrary code execution on the server.
Strike Microsoft Exchange ProxyShell EwsAutodiscoverProxyRequestHandler SSRF Auth Bypass	CWE: 918 CVE: 2021-34473	This strike exploits a server side request forgery (SSRF) vulnerability in the EwsAutodiscoverProxyRequestHandler component of Microsoft Exchange. The vulnerability is due to insufficient handling of explicit logon requests to the autodiscover component of Exchange. An unauthenticated, remote attacker can exploit this vulnerability by sending a crafted request to the vulnerable Exchange server. Successful exploitation results in requests being made to backend servers with administrative privileges without any need of authentication. *NOTE: In OneArm mode, the strike makes requests for enumerating email addresses, Server ID , Legacy DN and saves a draft email with a file attachment with SID 'S-1-5-21-1943555408-1405878097-3563671238-500'.
Strike Microsoft Exchange Proxyshell PowerShell Backend Privesc	CWE: 287 CVE: 2021-34523	This strike exploits a privilege escalation vulnerability in the PowerShell remoting feature of Microsoft Exchange. The vulnerability is due to improperly deserializing access token provided in the request. A remote authenticated attacker can provide the access token for an user (including the Exchange Admin user) as part of X-Rps-CAT query in the request resulting in to run powershell commands impersonating the that user.

Name	References	Description
Strike Foxit Reader and Editor Use-After-Free Vulnerability in Annotation Handling	CVE: 2021-34833	This strike exploits a use-after-free vulnerability in Foxit PDF Reader and Editor. The vulnerability resides in the improper handling of the author property of Annotation objects within JavaScript. Exploiting this flaw allows a remote attacker to execute arbitrary code by enticing a user to open a maliciously crafted PDF file.
Strike Realtek SDK Management Web Interface Vulnerabilities	CVE: 2021-35395 CWE: 77	This strike exploits multiple vulnerabilities in the Realtek SDK Management Web Interface. The vulnerabilities are due to improper validation of user supplied input and might result in remote code execution. A remote, unauthenticated attacker might exploit this vulnerability by sending a crafted HTTP message to the targeted device. Note: This strike exploits the vulnerability in formSysCmd and formWsc endpoints.
Strike ForgeRock Access management Insecure Deserialization	CWE: 502 CVE: 2021-35464	An insecure deserialization vulnerability exists in ForgeRock Access Management and OpenAM. The vulnerability is due to insufficient validation of user-supplied data. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted HTTP request. Successful exploitation results in full control of the target server.
Strike Oracle Access Manager OpenSSO Agent Insecure Deserialization	CWE: 502 CVE: 2021-35587	This strike exploits an insecure deserialization vulnerability in Oracle Access Manager. The vulnerability is due to insufficient validation of requests sent to the OpenSSO Agent endpoint. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to a vulnerable server. Successful exploitation can result in arbitrary code execution under the security context of the affected server.
Strike Hikvision Improper Input Validation	CWE: 78 CVE: 2021-36260	This strike exploits a command injection vulnerability in Hikvision IP camera/NVR firmware. The vulnerability is due to the insufficient input validation. It inserts a command into an XML payload used with an HTTP PUT request sent to the '/SDK/webLanguage' endpoint, resulting in command execution as the root user. A remote, unauthenticated attacker could exploit the vulnerability to launch a command injection attack by sending some messages with malicious commands.
Strike Sunhillo SureLine OS Command Injection Vulnerability	CWE: 78 CVE: 2021-36380	This strike exploits an OS command injection vulnerability in Sunhillo SureLine. The vulnerability is caused by improper input sanitization in the /cgi/networkDiag.cgi script, which allows attackers to execute arbitrary commands with root privileges. By manipulating user-controllable parameters ipAddr or dnsAddr, remote unauthenticated attackers can inject OS commands. Successful exploitation could lead to remote code execution on the target server.
Strike Nagios XI Post-auth RCE through Path Traversal	CWE: 22 CVE: 2021-37343	This strike exploits a path traversal vulnerability in Nagios XI versions prior to 5.8.5 . This vulnerability is due to improper validation of the job parameter in autodiscovery feature. A remote authenticated attacker can exploit this vulnerability by sending a crafted request. Successful exploitation could result in arbitrary file creation and further more can result in arbitrary code being executed in the context of the web server. Note: This strike contains just the authentication and the request required to create a backdoor in the web server.

Name	References	Description
Strike Nagios XI Post-auth SQL Injection	CWE: 89 CVE: 2021-37350	This strike exploits a SQL Injection vulnerability in Nagios XI versions prior to 5.8.5. This vulnerability is due to improper validation of the field_value parameter in the bulkmodifications component. A remote authenticated attacker can exploit this vulnerability by sending a crafted request. Successful exploitation could allow an attacker to execute SQL commands on the target server.
Strike Zoho ManageEngine ServiceDesk Authentication Bypass Vulnerability	CWE: 306 CVE: 2021-37415	This strike exploits an authentication bypass vulnerability in the Zoho ServiceDesk Plus, in the REST API URLs on all versions prior to 11306. This vulnerability is due to an error in normalizing REST API URLs before applying security filtering against defined URI path patterns, bypassing security filters. Successful exploitation allows an attacker to send a crafted request to ServiceDesk Plus, which gets processed without any authentication.
Strike Centreon ProceduresProxy.class.php SQL Injection Vulnerability	CVE: 2021-37558	This strike exploits an SQL injection vulnerability in the Centreon web application. The vulnerability is located in the ProceduresProxy.class.php file, specifically within the getHostId() and getServiceId() functions, which fail to properly sanitize the host_name and service_description parameters. Exploiting this vulnerability allows a remote, unauthenticated attacker to execute arbitrary SQL commands on the database, potentially leading to unauthorized data manipulation or further compromise of the target system.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability cve_2021_37921	CVE: 2021-37921	This strike targets an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The issue arises from insufficient validation of uploaded files in the ReportsAction class. Exploiting this flaw allows a remote authenticated attacker to upload arbitrary files, potentially leading to remote code execution with SYSTEM privileges.
Strike Zoho ManageEngine ADManager Plus Unrestricted File Upload Vulnerability cve_2021_37926	CVE: 2021-37926	This strike exploits an unrestricted file upload vulnerability in Zoho ManageEngine ADManager Plus. The vulnerability exists due to insufficient validation of file types in the LicenseAction class when handling uploaded files. A remote authenticated attacker can leverage this flaw to upload malicious files, potentially leading to remote code execution with SYSTEM-level privileges.
Strike Google Chrome Hole Memory Corruption	CWE: 755 CVE: 2021-38003	This strike exploits a vulnerability in the V8 in Google Chrome. The vulnerability exists due to improper handling of the internal TheHole value when an exception occurs during execution. By crafting specific inputs, it is possible to trigger a scenario where TheHole leaks into JavaScript code. Successful exploitation could result in memory corruption.
Strike Microsoft Azure Open Management Infrastructure Authentication Bypass	CWE: 305 CVE: 2021-38647	This strike exploits an authentication bypass vulnerability in Microsoft Azure Open Management Infrastructure. The vulnerability is due to improper validation of the Authorization header in the HTTP request supplied. A remote attacker could exploit this vulnerability by sending a crafted request to a vulnerable server. A successful attack might result in the remote code execution in the context of root user.

Name	References	Description
Strike VMware NSX Manager XStream Remote Code Execution Vulnerability	CWE: 502 CVE: 2021-39144	This strike exploits an insecure deserialization vulnerability in the XStream library in VMWare NSX Manager. This flaw, originally identified as an XStream deserialization issue, leverages the application's XML processing to execute arbitrary code. Due to inadequate input validation in XStream, the application deserializes untrusted XML data insecurely. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted XML payload to an unauthenticated API endpoint. Successful exploitation could allow the attacker to execute code with elevated privileges, potentially leading to full system compromise.
Strike Grafana Labs Grafana Snapshot Authentication Bypass	CWE: 287 CVE: 2021-39226	This strike exploits an Authentication Bypass vulnerability in Grafana. The vulnerability is due to insufficient authorization on web endpoints - "/api/snapshots" and "/api/snapshots-delete". A remote, unauthenticated attacker can exploit the vulnerability by sending a request to one of the affected endpoints. Successful exploitation could result in disclosure of existing snapshots and deletion of application snapshots. *NOTE: While running this strike in OneArm mode, it sends a crafted request to the target server where the current snapshot can be viewed and the same can also be deleted.
Strike Nagios XI Custom Includes Component Arbitrary File Upload Vulnerability	CVE: 2021-40344	This strike exploits an arbitrary file upload vulnerability in the Custom Includes component of Nagios XI. The vulnerability resides in the misconfiguration of the .htaccess file within the /images subdirectory of the component. A remote, authenticated attacker can leverage this flaw to upload and execute malicious PHP code, potentially leading to arbitrary code execution under the web server's security context.
Strike Nagios XI cmdsubsys.php Command Injection Vulnerability	CVE: 2021-40345	This strike targets a command injection vulnerability in the cmdsubsys.php script of Nagios XI. The issue arises from improper sanitization of user-supplied input in the names of files within uploaded Zip archives. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary commands with the privileges of the nagios user.
Strike Apache httpd mod_proxy unix socket path SSRF	CWE: 918 CVE: 2021-40438	This strike exploits a Server Side Request Forgery (SSRF) vulnerability in Apache mod_proxy component. The vulnerability is due to a missing validation of the unix socket path in an HTTP request. A remote attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in target server sending requests to internal servers leading to information disclosure. *NOTE: When running this strike in OneArm mode, due to SSRF, the target server will attempt to send a HTTP GET request to the IP address 192.168.2.7 and port 8081.
Strike Zoho ManageEngine ADSelfService Plus Authentication Bypass	CWE: 287 CVE: 2021-40539	This strike exploits an authentication bypass vulnerability in Zoho ManageEngine ADSelfService Plus. The vulnerability is due to an error in normalizing the URLs before validation. A remote attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could allow the attacker to bypass authentication and exploit endpoints to perform subsequent attacks leading to arbitrary command execution. *NOTE: The strike attempts to perform authentication bypass and call random endpoints which usually requires authentication.

Name	References	Description
Strike Aviatrix Controller Unrestricted File Upload	CVE: 2021-40870 CWE: 23	This strike exploits a file upload vulnerability in Aviatrix Controller. The vulnerability allows unauthenticated attackers to upload malicious files, which can then be exploited via directory traversal to execute arbitrary code. Successful exploitation of this vulnerability allows remote attackers to execute arbitrary commands on the affected system.
Strike Metabase GeoJSON API Local File Inclusion Vulnerability	CVE: 2021-41277 CWE: 22	This strike exploits a local file inclusion vulnerability in Metabase GeoJSON API. The vulnerability is due to insufficient validation of url. A remote unauthenticated attacker can exploit this vulnerability by specially crafted HTTP GET request. Successful exploitation of this vulnerability could lead to information disclosure, file exposure and environment variables to unauthenticated users.
Strike Netgate pfSense diag_routes.php Command Injection Vulnerability	CVE: 2021-41282	This strike exploits a command injection vulnerability in Netgate pfSense. The vulnerability resides in the diag_routes.php file due to insufficient validation of user-supplied input in the filter parameter. A remote, authenticated attacker can leverage this flaw to execute arbitrary operating system commands, potentially leading to full system compromise.
Strike Apache HTTP Server Path Traversal	CWE: 22 CVE: 2021-41773	This strike exploits a Path Traversal vulnerability in Apache HTTP server prior to 2.4.50. This vulnerability is due to improper validation of path in the CGI extension. A remote attacker can exploit this vulnerability by sending a crafted request. Successful exploitation could allow an attacker to execute arbitrary commands on the target server. Note: In order to exploit this vulnerability the Apache HTTP server needs to have CGI extension enabled and granted permission for root folder.
Strike Apache httpd ap_normalize_path Directory Traversal	CWE: 22 CVE: 2021-42013	This strike exploits a directory traversal vulnerability in Apache httpd. The vulnerability is due to improper normalization of paths in the request URI. This vulnerability is due to incomplete fix of CVE-2021-41773. A remote, unauthenticated attacker could exploit the vulnerability by sending crafted HTTP requests to a target server configured with the exploitable configurations. Successful exploitation could result in execution of arbitrary code under the security context of the server process. *NOTE: When ran in OneArm mode, the strike will attempt to create a file in /tmp using /bin/bash
Strike Ivanti Avalanche Central FileStore Command Injection Vulnerability	CVE: 2021-42129	This strike exploits a command injection vulnerability in Ivanti Avalanche Enterprise Service. The vulnerability exists due to insufficient validation of input fields in the Central FileStore configuration settings. A remote, authenticated attacker could leverage this flaw by sending crafted requests, leading to the execution of arbitrary commands on the server with SYSTEM privileges.
Strike Sitecore XP Report.ashx Insecure Deserialization	CWE: 502 CVE: 2021-42237	This strike exploits an insecure deserialization vulnerability in Sitecore XP. This vulnerability is due to insufficient validation of serialized data sent to Report.ashx. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in arbitrary code execution within the security context of the user running the vulnerable application.

Name	References	Description
Strike BQE BillQuick Web Suite Login Page SQL Injection	CWE: 89 CVE: 2021-42258	This strike exploits a SQL injection vulnerability in BQE BillQuick web suite. The vulnerability is due to improper validation of user-supplied input when processing the login request. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in the execution of arbitrary SQL statement on the target server.
Strike Adobe RoboHelp Server fileName Directory Traversal	CWE: 78 CVE: 2021-42727	This strike exploits a directory traversal vulnerability in Adobe RoboHelp Server. When processing the fileName parameter, there is an input validation error that leads to this vulnerability. A remote authenticated attacker can exploit this vulnerability by sending crafted messages to the server. Successful exploitation could achieve arbitrary code execution with privileges of SYSTEM.
Strike Zoho ManageEngine Network Configuration Manager Ping Command Injection	CWE: 77 CVE: 2021-43319	This strike exploits a command injection vulnerability in Zoho ManageEngine Network Configuration Manager. The vulnerability is due to insufficient validation in the ipAddress field of the ping functionality in add device web interface. A remote, authenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could lead to arbitrary code execution in the security context of the web server. *Note : Upon running the strike in one-arm mode a file named Test is created in /tmp directory of the vulnerable server. The default credentials being used are admin/admin.
Strike FusionPBX fax_send.php Command Injection Vulnerability	CVE: 2021-43405	This strike exploits a command injection vulnerability in the fax_send.php script of FusionPBX. The vulnerability exists due to insufficient input validation of the fax_extension parameter in HTTP requests. Exploiting this flaw allows a remote, authenticated attacker to execute arbitrary system commands with the privileges of the server process.
Strike Grafana Plugin Directory Traversal	CWE: 22 CVE: 2021-43798	This strike exploits a directory traversal vulnerability in Grafana. The vulnerability is due to improper sanitization for the plugin assets route. A remote, unauthenticated attacker could exploit the vulnerability by sending crafted HTTP requests to a target server. Successful exploitation can result in arbitrary file read in the context of the Grafana user.
Strike Roundcube Webmail SQL Injection Vulnerability	CWE: 89 CVE: 2021-44026	This strike exploits an SQL injection vulnerability in Roundcube. The vulnerability is due to insufficient validation of user-provided search_params data. To execute the attack, the malicious actor must first authenticate within a Roundcube session. Upon successful exploitation, the attacker could read sensitive information, modify database content, or escalate privileges based on the permissions granted to the database account that Roundcube utilizes.
Strike Zoho ManageEngine ImportTechniciansAction Arbitrary File Upload	CWE: 287 CVE: 2021-44077	This strike exploits an arbitrary file write vulnerability that has been reported in Zoho ManageEngine ServiceDesk Plus, ServiceDesk Plus MSP, and SupportCenter Plus. The vulnerability is due to insufficient validation of input data. An unauthenticated remote attacker can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation results in the writing of an arbitrary file to the target application, potentially leading to execution of arbitrary code as SYSTEM.

Name	References	Description
Strike Apache httpd mod_proxy Null Pointer Dereference DoS	CWE: 476 CVE: 2021-44224	A denial of service vulnerability exists in multiple versions of Apache Software Foundation httpd prior to 2.4.52. The flaw is due to improper handling of malformed Request-URIs requests. An unauthenticated remote attacker may send a crafted request to the target server. Successful exploitation could result in a denial of service (DoS) condition.
Strike Apache Log4j JndiManager JNDI Injection RCE LDAP	CWE: 20 CVE: 2021-44228	A JNDI Injection vulnerability exists in Apache Log4j versions 2.0 - 2.14. The vulnerability is due to improper handling of logged messages in the JndiManager class. By sending a crafted message to be logged by the target application, a remote unauthenticated attacker may execute arbitrary code on the target system. *NOTE: When running this strike in OneArm mode, the attacker will send a request to make the vulnerable server attempt to make a LDAP request to a JNDI server running on 192.168.2.7 port 1389 to retrieve the serialized object which will execute mktemp command.
Strike Zoho Desktop Central Authentication Bypass Vulnerability	CWE: 287 CVE: 2021-44515	This strike exploits an authentication bypass vulnerability in ManageEngine Desktop Central. The vulnerability is due to an input validation error in the StateFilter class. A remote, unauthenticated attacker could bypass the authentication of the console component and then send commands via WebSockets to the managed devices by the ManageEngine Desktop Central server. This may potentially cause remote code execution, allowing a malicious, unauthenticated attacker to execute arbitrary code on the devices managed by the ManageEngine Desktop Central server.
Strike Ivanti EPM Cloud Services Appliance Code Injection Vulnerability	CWE: 94 CVE: 2021-44529	This strike exploits a command injection vulnerability in the Ivanti Cloud Services Appliance (CSA) for Ivanti Endpoint Manager. The vulnerability is due to insufficient input validation and improper handling of cookie data. The vulnerable code allows an unauthenticated attacker to inject and execute arbitrary PHP code by crafting specific cookie headers, leading to execution of base64-encoded payloads via the eval() function. Successful exploitation results in command execution as the 'nobody' user.
Strike Apache httpd mod_lua Integer Underflow	CWE: 191 CVE: 2021-44790	A integer underflow vulnerability exists in multiple versions of Apache Software Foundation httpd prior to 2.4.52. The flaw is due to improper handling of the request body. An unauthenticated remote attacker may sent a crafted request to the target server. Successful exploitation could result in remote code execution or denial of service condition. * Target Apached server must have the mod_lua module enabled and have the lua-script handler set for Lua scripts stored on the server. * The target must contain a Lua script utilizing the r:parsebody() function.
Strike Apache Log4j JndiManager JNDI Injection RCE	CWE: 610 CVE: 2021-45046	A JNDI Injection vulnerability exists in Apache Log4j version 2.0-beta9 to 2.15.0, excluding 2.12.2. The vulnerability is due to improper handling of logged messages when the logging configuration uses a non-default Pattern Layout. An attacker who can control an item in the MapMessage or StrucutredDataMessage can exploit this vulnerability by sending a crafted message to be logged by the target application, a remote unauthenticated attacker can cause denial of service or in certain configuration execute arbitrary code on the target system. This vulnerability is due to the incomplete fix for CVE-2021-44228. *NOTE: This strike uses the local hostname check bypass method.

Name	References	Description
Strike Apache Log4j StrSubstitutor Uncontrolled Recursion Denial of Service	CWE: 674 CVE: 2021-45105	An uncontrolled recursion from self-referential lookups exists in Apache Log4j version 2.0-alpha1 through 2.16.0 (excluding 2.12.3 and 2.3.1). An attacker who can control an item in Thread Context Map can exploit this vulnerability by sending a crafted message to be logged by the target application, a remote unauthenticated attacker can cause denial of service by sending a crafted message.
Strike D Link Multiple Routers Remote Code Execution Vulnerability	CVE: 2021-45382 CWE: 78	This strike exploits an OS command injection vulnerability in D-Link Routers. The vulnerability is due to insufficient validation of user supplied input. An unauthenticated attacker could exploit this vulnerability by sending a crafted HTTP request and might result in remote code execution.
Strike WordPress Photo Gallery Plugin SQL Injection Vulnerability	CVE: 2022-0169	This strike exploits a SQL injection vulnerability in the WordPress Photo Gallery plugin. The vulnerability arises from improper sanitization of the `bwg_tag_id_bwg_thumbnails_0` parameter in HTTP requests. A remote, unauthenticated attacker can leverage this flaw to execute arbitrary SQL commands on the database, potentially leading to data exfiltration or unauthorized access.
Strike Sophos Firewall User Portal and Webadmin Authentication Bypass	CWE: 287 CVE: 2022-1040	This strike exploits an Authentication Bypass vulnerability in Sophos Firewall. The vulnerability is due to insufficient sanitization of null characters in the "json" parameter sent to the Controller endpoint. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in access control policy bypass and remote code execution at worst. *NOTE: When running this strike in OneArm mode, it sends a crafted request to the target server on port 4444 for webadmin or on port 443 for userportal. Due to Authentication Bypass, the target server responds with a valid session cookie for the username in the request.
Strike Google Chrome defineProperty Improper Interceptor Handling	CWE: 843 CVE: 2022-1232 GOOGLE: 2280	This strike exploits a vulnerability in Google Chrome. Specifically, javascript can be crafted in such a way that when an Object replaces a property store an interceptor is encountered that causes memory corruption. When this happens a denial of service condition, or potentially remote code execution, may occur.
Strike F5 BIG-IP iControl REST Authentication Bypass	CWE: 306 CVE: 2022-1388	This strike exploits an authentication bypass vulnerability in F5 BIG-IP product. The vulnerability is due to improper handling of requests sent to management port. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the management port. A successful attack may result in remote code execution in the security context of ROOT.

Name	References	Description
Strike Keysight N6854A and N6841A RF Sensor Insecure Deserialization	CWE: 502 CVE: 2022-1660	This strike exploits an insecure deserialization vulnerability in Keysight N6854A and N6841A RF Sensor. The vulnerability is due to blind deserialization of untrusted data without any validation. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted HTTP request with malicious serialized data. Successful exploitation would result in arbitrary code execution with SYSTEM privileges. *NOTE: In one-arm mode, the strike executes the notepad binary on the target system whose process can be viewed from Task Manager
Strike KeySight N6854A and N6841A RF Sensor UserFirmwareRequestHandler Directory Traversal	CWE: 23 CVE: 2022-1661	This strike exploits a directory traversal vulnerability exists in KeySight N6854A and N6841A RF Sensor Software. This vulnerability is due to incomplete input sanitization in Java class UserFirmwareRequestHandler. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted request. Successful exploitation could read arbitrary files on the target server under the security context of the SYSTEM.
Strike Oracle JDeveloper ADF Faces Deserialization of Untrusted Data Vulnerability	CVE: 2022-21445 CWE: 502	This strike exploits an insecure deserialization vulnerability in Oracle JDeveloper ADF Faces. The vulnerability is due to insufficient validation of HTTP request. A remote unauthenticated attacker can exploit this vulnerability by sending crafted HTTP request to the vulnerable server. Successful exploitation of this vulnerability could lead to remote code execution in the context of the user using the vulnerable server.
Strike Gitlab Project Import Remote Code Execution	CWE: 732 CVE: 2022-2185	This strike exploits an OS command injection vulnerability in Gitlab. The vulnerability is due to improper handling of the import_source field. A remote Authenticated attacker can exploit the vulnerability by performing a bulk import from a server controlled by the attacker. Successful exploitation can result in remote code execution. Note: This strike includes just the last part of the attack where targeted server requires data from the custom server controlled by the attacker and the attacker's response.
Strike Apache httpd mod_lua req_parsebody Denial of Service	CWE: 665 CVE: 2022-22719	This strike exploits a denial of service vulnerability in Apache httpd. The vulnerability is due to use of uninitialized memory when processing a request. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could lead to crash of the server and with extended exploitation may lead to denial of service conditions.
Strike VMware Spring Cloud Gateway SpEL Code Injection	CWE: 94 CVE: 2022-22947	This strike exploits a remote code execution vulnerability in Spring Cloud Gateway. The vulnerability is due to improper validation of user-provided SpEL expressions. A remote attacker could exploit this vulnerability by sending a maliciously crafted request to an application using a vulnerable version of Spring Cloud Gateway. Successful exploitation could lead to remote code execution. *NOTE: When running this strike in OneArm mode, the strike will attempt to create a file called poc.txt in /tmp folder.

Name	References	Description
Strike Vmware Workspace ONE Access Freemarker Server-side Template Injection	CWE: 94 CVE: 2022-22954	This strike exploits a server side template injection vulnerability in VMware Workspace ONE Access and Identity Manager. The vulnerability is due to server-side template injection in the deviceUdid parameter. A remote, unauthenticated attacker can exploit this vulnerability by sending crafted requests. Successful attack can result in remote code execution on the target server.
Strike Spring Expression Resource Access Vulnerability	CWE: 94 CVE: 2022-22963	This strike exploits a remote code execution vulnerability in Spring Cloud Foundation. The vulnerability is due to lack of validation of the values provided in spring.cloud.function.routing-expression header in the HTTP packet. A remote unauthenticated attacker could exploit this vulnerability by embedding a specially crafted Spring Expression Language(SpEL) as a routing-expression in the HTTP packet which could lead to Remote Code Execution on the server. *NOTE: In one-arm, the strike will attempt to create a file named PWNED in the /tmp directory.
Strike VMware Spring Framework Data Binding ClassLoader	CWE: 94 CVE: 2022-22965	This strike exploits a remote code execution vulnerability in Spring Cloud Foundation. The vulnerability is due to inadequate validation of parameters used for data binding, allowing for manipulation of the ClassLoader. A remote attacker could exploit this vulnerability by providing a crafted parameter in an HTTP request. Successful exploitation could lead to ClassLoader manipulation, which may lead to execution of arbitrary code under the security context of the container of the target application. *NOTE: In one-arm, the strike will attempt to create a webshell at webapps/ROOT/shell.jsp which can be used for Remote Code Execution.
Strike SalesAgility SuiteCRM email_recipients Remote Code Execution Vulnerability	CVE: 2022-23940	This strike exploits a remote code execution vulnerability in SalesAgility SuiteCRM. The vulnerability is located in the improper input validation of the "email_recipients" parameter within HTTP POST requests. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary code on the target server.
Strike Apache APISIX batch-requests Plugin IP address Restriction Bypass	CWE: 290 CVE: 2022-24112	This strike exploits an authentication weakness vulnerability in Apache APISIX. The vulnerability is due to inefficient validation of client requests at the vulnerable API endpoint "/apisix/admin/batch-requests". A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the vulnerable server if the batch-requests plugin is enabled and it is using the default API key of the administrator. Successful exploitation could lead to arbitrary code execution under the security context of the server process. *NOTE: While running this strike in OneArm mode, it creates a new endpoint/route "/poc/testing" which is visited to execute a command to create a file called "poc" under the "/tmp" directory on the server.
Strike Apache Airflow DAG OS Command Injection	CWE: 78 CVE: 2022-24288	This strike exploits a command injection vulnerability in Apache Airflow. This vulnerability is due to improper input validation for parameters "foo" and "miff" for directed acyclic graphs or DAGs. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in command execution in the context of the user running the server. *NOTE : In one-arm mode, the strike uses airflow/airflow to login and uses example_passing_params_via_test_command DAG for exploitation which results in /tmp/test file being created.

Name	References	Description
Strike Zimbra Webmail Cross-Site Scripting	CVE: 2022-24682 CWE: 79	This strike exploits reflected cross-site scripting vulnerability in Zimbra Collaboration server. This vulnerability is due to insufficient input validation in the Calendar feature. A remote attacker could exploit this vulnerability by enticing the target to click on a crafted link. Successful exploitation could result in execution of script code in the security context of the target user's browser.
Strike MyBB Admin Control Panel Code Injection Vulnerability	CVE: 2022-24734	This strike targets a code injection vulnerability in the MyBB Admin Control Panel. The issue arises from improper input validation when processing user-supplied data in the settings management functionality. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary PHP code on the server with the privileges of the web application.
Strike Google Chrome ServiceWorkerVersion Use After Free	CWE: 416 CVE: 2022-2480 GOOGLE: 2321	This strike exploits a type confusion vulnerability in Google Chrome. Specifically, when the ServiceWorkerVersion::MaybeTimeoutRequest method is called it will remove the last reference to the version object which is bound to the callback and will cause the object's destruction. If this happens the MaybeTimeoutRequest function will attempt to access the freed object by means of its <code>inflight_requests_</code> field. When this happens a denial of service condition, or potentially remote code execution, may occur in the context of the browser process.
Strike TerraMaster TOS Unauthenticated Remote Code Execution	CWE: 74 CVE: 2022-24989	This strike exploits an unauthenticated command injection vulnerability in TerraMaster TOS. The vulnerability is due to the improper sanitization of the user input used in the <code>popen</code> function of the <code>createRaid</code> function. The vulnerability when chained with CVE-2022-24990 allows a remote unauthenticated attacker to execute arbitrary code as root through the <code>raidtype</code> and <code>diskstring</code> parameters during PHP Object Instantiation at the <code>api.php?mobile/createRaid</code> endpoint. Successful exploitation could result in arbitrary code execution under the security context of the user running the vulnerable application with root privileges.
Strike TerraMaster TOS Sensitive Information Leak Vulnerability	CWE: 306 CVE: 2022-24990	This strike exploits a sensitive information leak vulnerability in TerraMaster TOS. The vulnerability arises due to <code>webNasIPS</code> function in TerraMaster NAS devices which skips authentication checks. Attackers can exploit this vulnerability to obtain sensitive information like the admin password hash without authentication. The vulnerability when chained with CVE-2022-24989 allows a remote unauthenticated attacker to execute arbitrary code as root. Successful exploitation could result in information disclosure and in the worst case it could lead to remote code execution under the security context of the target server.
Strike Delta Industrial Automation DIAEnergie Arbitrary File Upload Vulnerability cve_2022_25347	CVE: 2022-25347	This strike exploits an arbitrary file upload vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability resides in the <code>HandlerPage_KID</code> endpoint, where insufficient input validation is performed on the <code>HtmlId</code> parameter and file extensions during file upload processing. A remote, unauthenticated attacker could leverage this flaw to upload malicious files to arbitrary locations on the server, potentially leading to the execution of arbitrary code within the web server's context.

Name	References	Description
Strike Atlassian Confluence OGNL Injection	CWE: 74 CVE: 2022-26134	This strike exploits an OGNL injection vulnerability in the Confluence Server and Data Center. The vulnerability is due to improper validation of the URL of a HTTP request. A successful attack can result in arbitrary command execution in the context of the server process.
Strike Atlassian Confluence App Hard-coded Credentials Vulnerability	CWE: 798 CVE: 2022-26138	The strike exploits a use of hardcoded credentials vulnerability in the web component of the Atlassian Confluence app. The vulnerability is due to the use of hardcoded credentials, specifically the username disabledsystemuser and the password disabled1system1user6708. A remote, unauthenticated attacker with knowledge of these default credentials could log into Confluence and access all content available to users in the confluence-users group. Successful exploitation could result in information disclosure.
Strike Open-Falcon Falcon-Plus SQL Injection in GetHostsFromGroup Function	CVE: 2022-26245	This strike exploits a SQL injection vulnerability in Open-Falcon Falcon-Plus. The vulnerability exists due to improper sanitization of user input in the /proc/group API endpoint. A remote attacker could leverage this flaw by sending a specially crafted request, leading to arbitrary SQL query execution on the database.
Strike Watchguard Fireware buffer overflow	CWE: 119 CVE: 2022-26318	This strike exploits a buffer overflow vulnerability in Watchguard Fireware. The vulnerability is due to improper validation of user input. A remote, unauthenticated attacker could exploit this vulnerability by submitting a specially crafted HTTP request which could result in arbitrary command execution in the context of NOBODY user. Note: In one-arm, a reverse shell is executed to the IP 192.168.102.113, port 8888.
Strike dotCMS processFile Directory Traversal	CWE: 22 CVE: 2022-26352	This strike exploits a Directory Traversal vulnerability in dotCMS. The vulnerability is due to insufficient validation of the names of files uploaded through the dotCMS content API. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in writing a file outside of the expected document root, possibly leading to, in the worst case, arbitrary code execution under the security context of the web server process. *NOTE: While running this strike in OneArm mode, a file named "poc.jsp" is created on the server.
Strike Delta Industrial Automation DIAEnergie SQL Injection Vulnerability in DIAE_loopmapHandler.ashx	CVE: 2022-26887	This strike exploits an SQL injection vulnerability in Delta Industrial Automation DIAEnergie. The vulnerability resides in the insufficient input validation of the "kid" parameter in HTTP requests to the DIAE_loopmapHandler.ashx endpoint. A remote, unauthenticated attacker could exploit this vulnerability by sending specially crafted requests, leading to the execution of arbitrary SQL commands with the privileges of NT SERVICE\MSSQLSERVER.
Strike Studio-42 elFinder Unrestricted File Upload Vulnerability	CVE: 2022-27115	This strike exploits an unrestricted file upload vulnerability in Studio-42 elFinder. The vulnerability resides in the improper validation of filenames during file uploads via the connector.minimal.php endpoint on Windows systems. Exploiting this vulnerability allows a remote, unauthenticated attacker to upload files with restricted extensions or malicious content, potentially leading to remote code execution.

Name	References	Description
Strike QNAP Photo Station Externally Controlled Reference Vulnerability	CWE: 610 CVE: 2022-27593	This strike exploits an externally controlled reference to a resource vulnerability in QNAP NAS devices running Photo Station. The vulnerability arises from an anomaly in PHP's fopen function, enabling an attacker to manipulate the 'g' parameter to traverse outside the intended cache directory and write cached files to arbitrary locations. Successful exploitation of this vulnerability would enable an attacker to modify system files. A remote, unauthenticated attacker could potentially fill up storage areas or exhaust other critical resources on the NAS, leading to denial of service for legitimate users or services dependent on those resources.
Strike Zoho ManageEngine OpManager SQL Injection in Inventory Reports	CVE: 2022-27908	This strike exploits a SQL injection vulnerability in Zoho ManageEngine OpManager. The vulnerability resides in the Inventory Reports module due to insufficient validation of HTTP request parameters. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL queries, potentially compromising the underlying database.
Strike Zimbra Collaboration Memcached CRLF Injection	CVE: 2022-27924 CWE: 93	This strike exploits a CRLF(Carriage Return followed by Line Feed) Injection vulnerability in the Zimbra Collaboration server. This vulnerability is due to insufficient sanitization of CRLF characters in HTTP Request-URIs and HTTP header values when performing route caching using Memcached. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could allow an attacker to inject arbitrary Memcached commands which would be executed by the server.
Strike Zimbra Collaboration MailboxImportServlet Authenticated Directory Traversal	CWE: 22 CVE: 2022-27925	This strike exploits an authenticated directory traversal vulnerability in Zimbra Collaboration. The vulnerability is due to improper validation of zip files uploaded to the MailboxImportServlet. A remote, authenticated attacker could exploit this vulnerability by uploading a crafted zip file to the target server. Successful exploitation could result in the attacker writing files outside of the expected document root, in the worst case, leading to arbitrary code execution under the security context of the server process.
Strike Zoho ManageEngine ADSelfService Plus Custom Script Command Injection	CWE: 78 CVE: 2022-28810	This strike exploits a command injection vulnerability in Zoho ManageEngine ADSelfService Plus. This vulnerability is due to insufficient sanitization of password field in the policy custom script. The attacker authenticates as the admin user in the vulnerable application and then sends a crafted HTTP POST request to the vulnerable server with malicious parameters which are the JSON values SCRIPT_COMMAND_RESET and SCRIPT_COMMAND_UNLOCK within the APC_SETTINGS_DETAILS. The vulnerability is triggered when a user changes or resets their password, or unlocks their account through ADSelfService Plus. Successful exploitation could result in command injection. *Note : Upon running the strike in one-arm mode, the output of command 'whoami' is appended to C:\ProgramData\randomfile.txt each time a victim changes or resets their password, or unlocks their account. The default credentials being used are admin/admin.

Name	References	Description
Strike SolarView Compact Command Injection	CWE: 78 CVE: 2022-29303	This strike exploits a command injection vulnerability in SolarView Compact. This vulnerability lies in the conf_mail.php component of the SolarView application. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted post request to the target server. Successful exploitation of this vulnerability could lead to remote code execution.
Strike WSO2 API Manager Directory Traversal	CWE: 434 CVE: 2022-29464	This strike exploits a directory traversal vulnerability in WSO2 API Manager. The vulnerability is due to improper sanitization for the multipart form field name for the file upload route. A remote, unauthenticated attacker could exploit the vulnerability by sending crafted HTTP requests to a target server. Successful exploitation can result in arbitrary file write in the context of the wso2carbon user.
Strike Mitel MiVoice Connect Data Validation Vulnerability	CWE: 20 CVE: 2022-29499	This strike exploits a server-side request forgery vulnerability in Mitel MiVoice. The vulnerability arises due to improper input validation of the get_url parameter in the vtest.php script. A remote, unauthenticated attacker can exploit this flaw to force the application to make an internal request to ucbsync.php, which is normally inaccessible from external sources. Successful exploitation can lead to remote code execution.
Strike Lansweeper HelpdeskActions.aspx Directory Traversal Vulnerability	CVE: 2022-29517	This strike exploits a directory traversal vulnerability in Lansweeper. The vulnerability exists due to insufficient sanitization of the inline attachment file names when editing templates. A remote, authenticated attacker could leverage this flaw to write arbitrary files to the target system, potentially leading to denial of service or other malicious outcomes.
Strike Microsoft Windows Support Diagnostic Tool (MSDT) Follina RCE	CWE: 829 CVE: 2022-30190	This strike exploits an remote code execution vulnerability AKA Follina in Microsoft Support Diagnostic Tool(MSDT) when MSDT is called using the URL protocol. The vulnerability is due to the MSDT tool executing arbitrary code. A remote unauthenticated attacker can trick the victim into downloading a malicious HTML file served by the attacker which might execute arbitrary code on the victim machine. *NOTE: The link to the malicious file can be embedded in a Word Document which can download the HTML file without any interaction. This vulnerability can also be exploited by invoking any web request command in Powershell. The strike simulates the latter scenario where the client downloads the malicious HTML from the server.
Strike Google Chrome NotifyCompleted Use After Free	CWE: 416 CVE: 2022-3038 GOOGLE: 2324	This strike exploits a vulnerability in Google Chrome. Specifically, when SetUpUpload posts a task with a bound raw loader pointer using the default task runner, it's possible for the loader to get destroyed before the task is executed, resulting in NotifyCompleted accessing freed memory. When this happens a denial of service condition, or potentially remote code execution, may occur.

Name	References	Description
Strike Zyxel Firewall CGI Command Injection	CWE: 78 CVE: 2022-30525	This strike exploits a command injection vulnerability in Zyxel Firewall. The vulnerability is due to improper input validation in the CGI component. A remote, unauthenticated attacker could exploit this by sending a maliciously crafted request to the CGI component. A successful attack may result in remote code execution in the security context of nobody user.
Strike WWBN AVideo unzipDirectory Directory Traversal Vulnerability	CVE: 2022-30547	This strike exploits a directory traversal vulnerability in WWBN AVideo. The vulnerability resides in the unzipDirectory function within the objects/functions.php file, which fails to properly sanitize file names during ZIP file extraction. A remote, authenticated attacker could leverage this flaw by uploading a crafted ZIP file, enabling arbitrary file writes and potential code execution within the web server's security context.
Strike Lansweeper AssetActions.aspx Directory Traversal Vulnerability	CVE: 2022-32573	This strike exploits a directory traversal vulnerability in Lansweeper. The vulnerability exists due to improper sanitization of the "txtdocname" parameter when processing file uploads. Exploiting this flaw allows a remote, authenticated attacker to perform arbitrary file writes on the target system, potentially leading to denial of service or other malicious outcomes.
Strike Apache Spark Command Injection	CWE: 77 CVE: 2022-33891	This strike exploits a command injection vulnerability in Apache Spark. The vulnerability is due to improper validation of user input. A remote, unauthenticated attacker could exploit this vulnerability by submitting a specially crafted HTTP request which could result in arbitrary command execution in the context of the user running the server.
Strike Django Trunc and Extract SQL Injection	CVE: 2022-34265 CWE: 89	This strike exploits two SQL injection vulnerabilities in Django. The vulnerabilities are due to insufficient sanitization of user input to kind and lookup_name parameters passed to database functions Trunc and Extract respectively. A remote attacker can exploit the vulnerabilities by sending a crafted request to the target server. Successful exploitation could result in execution of arbitrary SQL statements. *NOTE: When running this strike in OneArm mode, it sends a malicious request to the target Django webapp, and creates a new table in the database.
Strike Zoho ManageEngine Password Manager Pro XMLRPC Insecure Deserialization	CVE: 2022-35405 CWE: 502	This strike exploits a remote code execution vulnerability in Zoho ManageEngine Password Manager Pro. The vulnerability is due to deserialization of untrusted data by the XMLRPC component. A remote attacker can exploit this vulnerability by sending crafted HTTP requests to the target server. Successful exploitation results in remote code execution.
Strike ZK Framework Authentication Bypass	CWE: 200 CVE: 2022-36537	This strike exploits an authentication bypass vulnerability in ZK Java Framework. The vulnerability is due to lack of authentication in ZK AuUploader servlet. A remote unauthenticated attacker can exploit this vulnerability by sending a crafted request to the victim server which leads to the disclosure of sensitive files in the context of the webroot.

Name	References	Description
Strike Atlassian Bitbucket Server and Data Center Command Injection	CWE: 78 CVE: 2022-36804	This strike exploits a command injection vulnerability in Atlassian Bitbucket Server and Data Center. The vulnerability is due to improper validation of certain user input fields. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target repository to request an archive which injects an argument to run an OS command. Successful exploitation of the vulnerability could lead to arbitrary command execution under the security context of the service. *NOTE: While running this strike in OneArm mode, a file /tmp/poc is created on the server.
Strike Zimbra Collaboration MailboxImportServlet Authentication Bypass	CWE: 22 CVE: 2022-37042	This strike exploits an authentication bypass vulnerability in Zimbra Collaboration. The vulnerability is due to improper validation of zip files uploaded to the MailboxImportServlet. A remote, unauthenticated attacker could exploit this vulnerability by uploading a crafted zip file to the target server. Successful exploitation could result in the attacker writing files outside of the expected document root, in the worst case, leading to arbitrary code execution under the security context of the server process.
Strike Adobe ColdFusion Directory Traversal and Arbitrary Code Execution Vulnerability	CVE: 2022-38421	This strike exploits a directory traversal vulnerability in Adobe ColdFusion. The vulnerability exists due to improper input validation when processing HTTP parameters in the copydirectory.cfm script. A remote, authenticated attacker could leverage this flaw to execute arbitrary code with SYSTEM privileges on the target server.
Strike Google Chrome SetChangePassword ResponseCode Use After Free	CWE: 416 CVE: 2022-3842 GOOGLE: 2348	This strike exploits a vulnerability in Google Chrome. Specifically, a vulnerability exists inside WellKnownChangePasswordState::SetChangePasswordResponseCode function. It is possible to craft javascript in such a way that a Use After Free condition can trigger. When this happens a denial of service condition, or potentially remote code execution, may occur.
Strike Apache Airflow DAG run_id Command Injection	CWE: 94 CVE: 2022-40127	This strike exploits a command injection vulnerability in Apache Airflow. This vulnerability is due to improper input validation for parameter run_id for directed acyclic graphs or DAGs. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in command execution in the context of the user running the server. *NOTE : In one-arm mode, the strike uses airflow/ airflow to login and uses example_bash_operator DAG for exploitation which results in /tmp/Test file being created.
Strike pfSense pfBlockerNG Host Header Command Injection	CWE: 78 CVE: 2022-40624	This strike exploits a command injection vulnerability in Netgate pfSense pfBlockerNG. This vulnerability is due to improper input validation for the Host HTTP header. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in OS command injection in the context of root.

Name	References	Description
Strike Fortinet Multiple Products Administrative Interface Authentication Bypass	CWE: 288 CVE: 2022-40684	This strike exploits an Authentication Bypass vulnerability in multiple Fortinet products, including FortiOS, FortiProxy, and FortiSwitchManager. The vulnerability is due to errors in handling certain HTTP headers in user requests. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in an attacker bypassing authentication and executing commands as an admin user on the target system.
Strike Dolibarr ERP and CRM Code Injection Vulnerability in edit.php	CVE: 2022-40871	This strike exploits a code injection vulnerability in Dolibarr ERP and CRM. The vulnerability resides in the insufficient sanitization of parameters in HTTP POST requests to the edit.php endpoint. Successful exploitation allows a remote attacker to execute arbitrary PHP code on the target server, potentially leading to remote code execution.
Strike Microsoft Exchange Server Server-Side Request Forgery Vulnerability	CWE: 918 CVE: 2022-41040	This strike exploits a server-side request forgery vulnerability in Microsoft Exchange Server. The vulnerability is due to insufficient handling of requests to the autodiscover component of Exchange. An authenticated, remote attacker can exploit this vulnerability by sending a crafted request to the vulnerable Exchange server. Successful exploitation results in requests being made to backend servers. *NOTE: This strike sends a request to /mapi/nsipi/ or ews/exchange.asmx which are inaccessible by default. In one-arm mode we use the authorization Administrator:Password1
Strike Centreon Web Poller Resource SQL Injection Vulnerability	CVE: 2022-41142	This strike exploits a SQL injection vulnerability in the Centreon Web Poller Resource module. The vulnerability exists due to insufficient input validation of the `resource_activate[resource_activate]` parameter in the `insertResource` function. A remote, authenticated attacker could leverage this flaw by sending a specially crafted HTTP request, potentially leading to arbitrary SQL command execution on the target database.
Strike pgAdmin validate_binary_path Remote Code Execution	CWE: 78 CVE: 2022-4223	This strike exploits a remote code injection vulnerability in pgAdmin. The vulnerability is due to insufficient input validation of the utility_path parameter sent to the validate_binary_path endpoint. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted request to the vulnerable endpoint. Successful exploitation would result in execution of arbitrary code in the security context of the service. *NOTE: While running this strike in OneArm mode, a file /tmp/poc is created on the server.
Strike Centreon Web formContactGroup.php SQL Injection Vulnerability	CVE: 2022-42427	This strike exploits an SQL injection vulnerability in the Centreon Web application. The vulnerability exists due to improper validation of the `cg_id` parameter in the `formContactGroup.php` script. A remote, authenticated attacker could leverage this flaw by sending a specially crafted HTTP request, potentially leading to the execution of arbitrary SQL commands on the database.

Name	References	Description
Strike Apache Common Text Library Text4Shell RCE	CWE: 94 CVE: 2022-42889	This strike exploits a Remote code execution vulnerability in Apache Commons Text. This vulnerability is due to insecure string interpolation defaults. A remote attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in the execution of arbitrary code. *NOTE: In one-arm mode, the strike either creates a random file in the /tmp folder of the server or makes the server reach out to a malicious attacker controlled host at ip - 10.39.44.149 and port - 8080.
Strike Zoho ManageEngine Password Manager Pro UserGroupListTable Controller SQL Injection	CWE: 89 CVE: 2022-43672	The strike exploits an SQL injection vulnerability in Zoho ManageEngine Password Manager Pro and related products. The vulnerability is due to improper validation of actionType parameter in the UserGroupListTableController class. A remote attacker can exploit the vulnerability by sending a crafted request to the target server. Successful exploitation could lead to arbitrary SQL code execution in the security context of database service, which runs as SYSTEM.
Strike Atlassian Bitbucket Server and Data Center Command Injection Vulnerability	CWE: 77 CVE: 2022-43781	This strike exploits a command injection vulnerability in Atlassian Bitbucket Server and Data Center. The vulnerability is due to improper validation of usernames on the server. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in arbitrary command execution in the security context of the user running the vulnerable application. *NOTE: While running this strike in OneArm mode, a file /tmp/poc is created on the server.
Strike Contec CONPROSYS HMI System chkFormula Command Injection	CVE: 2022-44456 CWE: 78	This strike exploits a vulnerability in the Contec CONPROSYS HMI system. A vulnerability exists due to insufficient sanitation when parsing JSON object and will be triggered when the attacker parses the JSON object with the injected escape character, which allows remote code execution to occur in the context of the web server.
Strike TP-Link Archer AX21 Country Command Injection	CVE: 2023-1389 CWE: 77	This strike exploits a command injection vulnerability in TP-Link Archer AX21. The vulnerability is due to the improper sanitization of the country parameter. A remote, unauthenticated attacker could exploit this vulnerability by injecting the commands into the country parameter. Execution requires sending the request twice, the first request sets the command in the country value, and the second request executes it. Successful exploitation could allow an attacker to achieve remote code execution with root privileges.
Strike Sophos Web Appliance Command Injection Vulnerability	CWE: 77 CVE: 2023-1671	This strike exploits a pre-auth command injection vulnerability in the warn-proceed handler of the Sophos Web Appliance. The vulnerability arises due to improper sanitization of user-provided input. It allows a remote, unauthenticated attacker to inject commands through the data field by escaping commands with a single quote. Successful exploitation could result in arbitrary code execution under the security context of the user running the vulnerable application.

Name	References	Description
Strike WordPress Limit Login Attempts Plugin Stored Cross Site Scripting	CWE: 79 CVE: 2023-1861	A stored cross-site scripting vulnerability has been discovered in WordPress Limit Login Attempts Plugin. The vulnerability is due to improper input validation of the cookie value. A remote, unauthenticated attacker could exploit this vulnerability by sending requests with crafted cookie to the target system. Successful exploitation could result in stored cross-site scripting. The vendor has released a patch to address this vulnerability in plugin version 1.7.2.
Strike Cisco IOS XE WebUI Authentication Bypass	CWE: 284 CVE: 2023-20198	This strike exploits an authentication bypass vulnerability in the WebUI component of Cisco IOS XE. This vulnerability is due to improper configuration of the nginx reverse proxy server. A remote, unauthenticated attacker can exploit this vulnerability to bypass authentication by accessing an internal endpoint. Successful exploitation results in the ability to issue privilege commands, including to create a new local user.
Strike Cisco IOS XE WebUI Command Injection	CWE: 78 CVE: 2023-20273	This strike exploits a command injection vulnerability in the WebUI component of Cisco IOS XE. This vulnerability is due to insufficient validation of IPv6 addresses supplied when performing a software upgrade. A remote, authenticated attacker can exploit this vulnerability by sending crafted HTTP requests to the target server. Successful exploitation results in the execution of arbitrary OS commands with the privileges of root.
Strike VMware Aria Operations for Logs InternalClusterController Insecure Deserialization	CWE: 502 CVE: 2023-20864	An insecure deserialization vulnerability has been reported in VMware Aria Operations for Logs. The vulnerability is due to improper validation of user data. A remote unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in arbitrary code execution under the security context of the root user.
Strike Vmware Aria Operations for Networks resttosaasservlet Command Injection Vulnerability	CWE: 77 CVE: 2023-20887	This strike exploits a command injection vulnerability in Vmware Aria Operations for Networks. The vulnerability is due to improper input handling in API requests and an Nginx misconfiguration that allows access to the restricted internal API endpoint /resttosaasservlet. A remote, unauthenticated attacker can exploit this vulnerability by sending specially crafted requests, bypassing the Nginx reverse proxy configuration. Successful exploitation can lead to the execution of arbitrary commands on the underlying operating system with root privileges, potentially resulting in full system compromise.
Strike VMware Aria Operations for Networks saveFileToDisk Directory Traversal Vulnerability	CWE: 22 CVE: 2023-20890	This strike exploits a directory traversal vulnerability in VMware Aria Operations for Networks. The vulnerability is due to improper validation of file names when uploading files to the appliance. The filename parameter from the multipart request is not sanitized before it is used to create a path to the file. A remote, authenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation will allow an attacker to write files outside of the expected temp directories. In the worst case, this could be leveraged to achieve arbitrary code execution under the security context of the root user.

Name	References	Description
Strike Wordpress WpForo Plugin LFI SSRF Deserialization	CWE: 98 CVE: 2023-2249	This strike exploits a File Inclusion and Server Side Request Forgery (SSRF) vulnerability in wpforo plugin of wordpress. This vulnerability is due to lack of input validation for the image_blob parameter which is passed to the php get_file_contents method call. A remote, authenticated low-privileged attacker could exploit this vulnerability by sending a crafted request to the target wordpress server. A successful attack may result in local file inclusion, server side request forgery or insecure deserialization in the server. *NOTE: In one-arm, the strike attempts to login with the creds - 'victimtest/1234' and attempts to fetch the contents of /etc/passwd or reach an internal endpoint at 'http://10.39.44.149:4445/secret' depending on the variant being ran.
Strike Atlassian Confluence Data Center and Server Setup Action Privilege Escalation	CWE: 863 CVE: 2023-22515	This strike exploits a privilege escalation vulnerability in Atlassian Confluence Data Center and Server. The vulnerability is attributed to a weakness in access control within the setup actions component. Its root cause lies in the attacker's ability to execute complex getter/setter chains on the Action object for unauthenticated endpoints, allowing manipulation of crucial properties. Through the modification of the setupComplete variable, the attacker successfully exploited the setup functionality, resulting in the creation of a new administrator user. An unauthenticated, remote attacker could leverage this vulnerability by sending meticulously crafted requests to the setup endpoint. Successful exploitation could lead to the execution of arbitrary code within the security context of the newly created administrator user.
Strike Atlassian Confluence Data Center and Server Improper Authorization	CWE: 863 CVE: 2023-22518	This strike exploits an improper authorization vulnerability in Atlassian Confluence Data Center and Server. The vulnerability arises from the absence of authentication for legacy endpoints associated with the application restore feature, specifically the "/json/setup-restore.action" endpoint. Given the lack of authentication requirements for accessing this endpoint, a malicious actor could exploit this vulnerability to delete all data in a Confluence installation and replace it with data under their control. A remote, unauthenticated attacker could leverage this vulnerability by sending carefully crafted requests to the target server. If successfully exploited, this could lead to privilege escalation and the potential execution of arbitrary code on the targeted system.
Strike Atlassian Confluence Data Center and Server Template Injection	CWE: 74 CVE: 2023-22527	This strike exploits a template injection vulnerability in Atlassian Confluence Data Center and Server. The vulnerability is due to improper validation of user data sent to the sever. The label parameter is not properly escaped before use in an OGNL expression. This allows arbitrary OGNL expression evaluation. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary code execution under the security context of the user running the vulnerable application. *NOTE: While running the strike in one-arm mode, a file gets created in the /tmp directory of the vulnerable server.

Name	References	Description
Strike Zoho ManageEngine SupportCenter Plus Command Injection via Custom Schedules Executor	CVE: 2023-23076	This strike exploits a command injection vulnerability in Zoho ManageEngine SupportCenter Plus. The vulnerability exists due to insufficient validation of the "executor" parameter in the custom schedule settings. A remote, authenticated attacker could leverage this flaw by sending specially crafted requests, leading to arbitrary command execution with SYSTEM privileges.
Strike Joomla CMS Webservice Authentication Bypass	CWE: 284 CVE: 2023-23752	This strike exploits an authentication bypass vulnerability in Joomla CMS. The vulnerability is due to inadequate sanitization of request parameters when processing API requests. If the request includes a 'public' parameter its value will overwrite the route default variable, and unauthenticated access may be granted to private API routes. An unauthenticated remote attacker can manipulate request parameters, leading to potential unauthorized access to private API routes that require authentication. Successful exploitation could result in sensitive information disclosure, including Joomla database credentials. Attackers could leverage this information to gain unauthorized access, modify user passwords, or perform brute-force attacks on user accounts. *Note: Running this strike in one-arm mode reveals the database credentials and other sensitive information.
Strike Citrix ShareFile Storage Zones Controller ProcessRawPostedFile Directory Traversal	CWE: 284 CVE: 2023-24489	This strike exploits a directory traversal vulnerability in the Upload module of the Citrix ShareFile Storage Zones Controller. The vulnerability is due to improper validation of user input in the ProcessRawPostedFile function. A remote, unauthenticated attacker could exploit this vulnerability by sending a request with a crafted uploadId request parameter to the target server. Successful exploitation could allow an attacker to save files to an arbitrary file path under the web root directory, which could lead to the execution of arbitrary code.
Strike D-Link DIR-820 Router ping.ccp OS Command Injection	CVE: 2023-25280 CWE: 78	This strike exploits an OS command injection vulnerability in D-Link DIR-820 Router. The vulnerability is due to improper sanitization of ping_addr parameter used in ping.ccp endpoint. A remote, unauthenticated attacker can exploit this vulnerability by sending a crafted payload to the ping_addr parameter. Successful exploitation could result in remote code execution on the affected device and potential escalation of privileges to root.
Strike Ruckus Wireless Admin Unauthenticated RCE	CWE: 94 CVE: 2023-25717	This strike exploits a remote code execution vulnerability in Ruckus Wireless routers. The vulnerability is due to insufficient input validation in the '/forms/doLogin' endpoint of the admin web page. A remote unauthenticated attacker can exploit this vulnerability by sending crafted requests to the victim router which results in remote code execution.
Strike Adobe ColdFusion convertToTemplateProxy Insecure Deserialization	CWE: 502 CVE: 2023-26360	This strike exploits an insecure deserialization vulnerability in Adobe ColdFusion. The vulnerability is due to deserialization of untrusted data when processing HTTP parameters sent to ColdFusion Component (CFC) endpoints. A remote, unauthenticated, attacker could exploit this vulnerability by injecting crafted CFML tags into logs and then trigger the exploit by requesting the log file. Successful exploitation could result in arbitrary code execution in the security context of SYSTEM.

Name	References	Description
Strike PaperCut MF and NG SetupCompleted formSubmit Authentication Bypass	CVE: 2023-27350 CWE: 284	This strike exploits an authentication bypass vulnerability in PaperCut MF/NG. The vulnerability is due to improper access and authentication control in "SetupCompleted" class. A remote, unauthenticated attacker could exploit the vulnerability by sending a request to the "/app" endpoint on the target server. Successful exploitation could result in authentication bypass and, in the worst case, arbitrary code execution on the server under the security context of SYSTEM. *NOTE - While running this strike in OneArm mode, windows calculator application runs on the target server.
Strike Zoho ManageEngine ADSelfService Plus Mobile App Authentication API Denial of Service	CWE: 476 CVE: 2023-28342	This strike exploits an authentication bypass vulnerability in Zoho ManageEngine ADSelfService Plus. The vulnerability is due to improper input validation in the Mobile App Authentication API. A remote, unauthenticated attacker could send a crafted request to the authentication endpoint without a password parameter. When the target server processes the request, it will pass the null password value to a native function resulting in an access violation and subsequently terminating and restarting the server process. Successfull exploition could result in denial of service.
Strike Contec CONPROSYS HMI System SQL Injection Vulnerability	CVE: 2023-29154 CWE: 89	This strike exploits an SQL injection vulnerability in Contec CONPROSYS HMI System. The vulnerability is due to insufficient sanitization of user data used in query_getTableCol.php. The query retrieves the metadata of the database table. However, the code fails to check for SQL injection characters in the JSON parameter of the table. As a result, a remote, authenticated attacker could exploit this vulnerability by sending a specially crafted request to the target server. A successful attack may allow the execution of arbitrary SQL commands against the database on the target server.
Strike Ghost CMS static-theme.js Directory Traversal Vulnerability	CVE: 2023-32235	This strike exploits a directory traversal vulnerability in Ghost CMS. The vulnerability resides in the static-theme.js component, where user-supplied paths are improperly validated. A remote attacker could leverage this flaw to access sensitive files on the server, potentially exposing confidential information.
Strike Ignite Realtime Openfire Path Traversal Vulnerability	CWE: 22 CVE: 2023-32315	This strike exploits a path traversal vulnerability in Ignite Realtime Openfire. This vulnerability is due to the improper handling of UTF-16 encoded characters in URLs. It allows an unauthenticated user to use an already configured Openfire environment to access restricted pages in the Admin Console reserved for administrative users. This vulnerability can be used to create a new admin user, which can then be used to upload a Openfire management plugin weaponized with a Java native payload that triggers an RCE. Successful exploitation could result in authentication bypass and remote code execution through access to the restricted Admin Console pages. *NOTE: While running the strike in one-arm mode, the CSRF token can be retrieved from the response, which can be further used to create a new admin user account.

Name	References	Description
Strike Ivanti Avalanche Remote Control Server updateSkin Directory Traversal	CWE: 22 CVE: 2023-32563	This strike exploits a directory traversal vulnerability in Ivanti Avalanche Remote Control Server. The vulnerability is due to improper input validation of the updateSkin function. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in remote code execution in the context of SYSTEM.
Strike Jenkins Sidebar Link Plugin icon Directory Traversal Vulnerability	CVE: 2023-32985 CWE: 22	This strike exploits a directory traversal vulnerability in Jenkins Sidebar Link Plugin. This vulnerability is due to a directory traversal when handling link icons. The vulnerability exists when the function SidebarLinkPlugin.doCheckLinkIcon() is called, the value of the parameter value or the path that is created is never sanitized or normalized of directory traversal related characters. A remote, authenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in information disclosure. *NOTE: While running this strike in OneArm mode, the existence of the file "/etc/passwd" on the target server is checked. The credentials used are as follows: the username is "jenkins_user" and the password is "jenkins".
Strike Zimbra Webmail Draftid Cross-Site Scripting	CWE: 79 CVE: 2023-34192	This strike exploits a cross-site scripting vulnerability in the web component of Zimbra Collaboration Suite. The vulnerability is due to improper input sanitization. A remote authenticated attacker could exploit this vulnerability by sending a crafted request to the target system. Successful exploitation could result in execution of script code in the security context of the target user's browser.
Strike Google Chrome V8 Engine JSStackCheck Type Confusion	CWE: 843 CVE: 2023-3420	This strike exploits a type confusion vulnerability in the V8 JavaScript engine of Google Chrome. The vulnerability is due to incorrect side effect modelling of JSStackCheck. A remote attacker could exploit this vulnerability by enticing a user into opening a crafted HTML page. Successful exploitation could result in execution of arbitrary code in the context of the Google Chrome sandbox.
Strike Progress MOVEit Transfer moveitisapi SQL Injection	CWE: 89 CVE: 2023-34362	This strike exploits an SQL injection vulnerability for MOVEit Transfer. This vulnerability is due to lack of input validation sent to the endpoints /MOVEitISAPI.dll and /guestaccess.aspx. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. A successful attack may result in arbitrary SQL command execution against the database on the target server.
Strike Progress MOVEit Transfer SILCertToUser SQL Injection	CWE: 89 CVE: 2023-35036	This strike exploits an SQL injection vulnerability in MOVEit Transfer. This vulnerability is due to insufficient input validation in the 'X-IPSGW-ClientCert' header of the request sent to the endpoint /certtousergw.aspx. A remote, unauthenticated attacker could exploit this vulnerability by injecting SQL injection payload in the issuer or the subject field of the certificate in the request. A successful attack may result in arbitrary SQL command execution against the database on the target server.

Name	References	Description
Strike Ivanti Endpoint Manager Mobile (EPMM) and MobileIron Core Authentication Bypass	CWE: 287 CVE: 2023-35082	This strike exploits an authentication bypass vulnerability in Ivanti Endpoint Manager Mobile. The vulnerability is due to a logic flaw and allows a remote unauthenticated attacker to access API endpoints on exposed management servers or resources without proper authentication. This access grants them the ability to execute various operations, potentially compromising sensitive information or modifying platform configurations.
Strike Progress MOVEit Transfer UserProcessPassChangeRequest SQL Injection	CWE: 89 CVE: 2023-36934	This strike exploits an SQL injection vulnerability in MOVEit Transfer. This vulnerability is due to insufficient validation of encrypted query parameters which is formed from the initial request sent to the /human.aspx of the server. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. A successful attack would result in arbitrary SQL command execution against the database on the target server.
Strike Ivanti MobileIron Sentry uploadFileUsingFile Input Authentication Bypass Vulnerability	CWE: 863 CVE: 2023-38035	This strike exploits an authentication bypass vulnerability in MICS Admin Portal in Ivanti MobileIron Sentry. A remote, unauthenticated attacker can bypass authentication controls on the administrative interface due to an insufficiently restrictive Apache HTTPD configuration. Successful exploitation of this vulnerability could allow an attacker to bypass authentication and gain unauthorized access to the system.
Strike Adobe ColdFusion Deserialization of Untrusted Data Vulnerability	CWE: 502 CVE: 2023-38203	This strike exploits an insecure deserialization vulnerability in Adobe ColdFusion. The vulnerability is due to inadequate filtering of Java class paths during the deserialization process, allowing remote, unauthenticated attackers to send maliciously crafted serialized objects. These objects can lead to arbitrary code execution within the application. ColdFusion uses a denylist to prevent certain classes from being deserialized, however, the class com.sun.rowset.JdbcRowSetImpl was not blocked, which attackers exploited. Successful exploitation of this vulnerability allows attackers to execute arbitrary code on the affected system.
Strike Adobe ColdFusion Insecure Deserialization	CWE: 502 CVE: 2023-38204	This strike exploits an insecure deserialization vulnerability in Adobe ColdFusion. The vulnerability is due to deserialization of untrusted data when processing HTTP parameters sent to ColdFusion Component (CFC) endpoints. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Specifically, an attacker can send an HTTP request to any valid CFC endpoint with the _cfclient parameter set to true and a crafted argumentCollection HTTP parameter, containing a WDDX packet with a struct element containing a type attribute set to a class name. Successful exploitation could result in arbitrary code execution in the security context of system.
Strike Adobe ColdFusion IPFilterUtils Improper Access Control CVE 2023-38205	CWE: 284 CVE: 2023-38205	This strike exploits an improper access control vulnerability in Adobe ColdFusion. The vulnerability is due to improper validation of the URL path by the IPFilterUtils class which was supposed to block access to sensitive endpoints if accessed from an IP address not from the allow list. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests with extra characters to the target server. Successful exploitation could result in access to the ColdFusion Administrator endpoints.

Name	References	Description
Strike Cacti Group graph_view.php SQL Injection Vulnerability	CWE: 89 CVE: 2023-39361	This strike exploits an SQL injection vulnerability in Cacti. The vulnerability is due to improper validation of user data in the graph_view.php script. The rfilter parameter is validated to be a valid regular expression, but not validated to prevent SQL injection. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could result in arbitrary SQL command execution against the database on the target server. *NOTE - While running the strike in one-arm mode it creates a table named "POC" in the target server.
Strike Qlik Sense Path Traversal	CWE: 22 CVE: 2023-41266	This strike exploits a path traversal vulnerability in Qlik sense. A remote, unauthenticated attacker can exploit this by creating an anonymous session and sending maliciously crafted HTTP requests. Successful exploitation could allow the attacker to send further requests to unauthorized endpoints.
Strike Netgate pfSense Command Injection in GIF-GRE Interface Configuration	CVE: 2023-42326	This strike exploits a command injection vulnerability in Netgate pfSense. The vulnerability resides in the improper input validation of parameters in the interfaces_gif_edit.php and interfaces_gre_edit.php files. A remote, authenticated attacker could leverage this flaw by sending specially crafted HTTP POST requests, leading to the execution of arbitrary commands with root privileges.
Strike JetBrains TeamCity XML-RPC Authentication Bypass Vulnerability	CWE: 288 CVE: 2023-42793	This strike exploits an authentication bypass vulnerability in JetBrains TeamCity. The vulnerability is due to improper handling of requests using XML-RPC with the "/RPC2" suffix in the Request-URI, which bypasses authentication. Exploiting this vulnerability enables attackers to gain administrator-level access by sending crafted requests to the target server. With elevated privileges, attackers can execute arbitrary commands under the security context of the target server. *Note : While running the strike in one-arm mode, it creates a file /tmp/test on the target server.
Strike Nextgen Mirth Connect XStreamSerializer Insecure Deserialization Vulnerability	CWE: 502 CVE: 2023-43208	This strike exploits an insecure deserialization vulnerability in Nextgen Mirth Connect. This vulnerability is due to improper input validation of XML request body data. The vulnerability exploits the insecure usage of the Java XStream library to unmarshal XML payloads. This improper handling allows attackers to craft malicious XML payloads that can bypass security checks and execute code on the server. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successfully exploiting this vulnerability could result in remote code execution in the security context of SYSTEM. *NOTE : While running the strike as one-arm, the file /tmp/test gets created on the target server.
Strike Ivanti Avalanche FileStoreConfig Arbitrary FileUpload Vulnerability	CVE: 2023-46263 CWE: 434	This strike exploits an arbitrary file upload vulnerability in Ivanti Avalanche. The vulnerability is due to inadequate validation of the txtUncPath field in the Central FileStore configuration settings. A remote authenticated attacker can exploit this by setting the file storage path to target unauthorized directories, specifically the RemoteControl server's webroot. The insufficient checks allow the attacker to bypass blacklist restrictions, enabling malicious files to be uploaded and executed as SYSTEM on the server. Successful exploitation of this vulnerability could lead to remote code execution in the context of the user using the vulnerable server.

Name	References	Description
Strike Ivanti Connect Secure and Policy Secure Gateways Authentication Bypass	CWE: 287 CVE: 2023-46805	This strike exploits an authentication bypass vulnerability has been reported in Ivanti Connect Secure (formerly Pulse Secure) and Ivanti Policy Secure Gateways. This vulnerability is due to insufficient validation of HTTP request paths in the web process. A remote, unauthenticated attacker can exploit this vulnerability by using one of the Request-URI prefixes and pivoting to a second endpoint. Successful exploitation could result in unauthenticated access to some authenticated REST API endpoints.
Strike QNAP VioStor NVR OS command injection	CWE: 78 CVE: 2023-47565	This strike exploits an OS command injection vulnerability in QNAP VioStor NVR models running QVR Firmware 4.x. The vulnerability is due to improper validation of user-supplied data. A remote, authenticated attacker can exploit this vulnerability by submitting a crafted request to the target server. Successful exploitation could result in remote code execution in the context of the running sever.
Strike Apache OFBiz XMLRPC Insecure Deserialization CVE 2023-49070	CWE: 94 CVE: 2023-49070	This strike exploits an insecure deserialization vulnerability in Apache OFBiz. This vulnerability is due to the unmaintained XML-RPC library which deserializes user data. A remote, unauthenticated attacker could exploit this vulnerability by sending a request to the server with an encoded or unnormalized request URI to the "xmlrpc" endpoint, an empty USERNAME or PASSWORD parameter with a parameter requirePasswordChange with a value of Y, and a crafted Java object in a serializable XML element. Successfully exploiting this vulnerability could result in remote code execution in the security context of the user running the OFBiz server.
Strike ownCloud Graph API Information Disclosure Vulnerability	CWE: 22 CVE: 2023-49103	This strike exploits an information disclosure vulnerability in the ownCloud Graph API extension. The vulnerability exists because the affected versions rely on a third-party GetPhpInfo.php library that exposes the secrets stored in environment variables. This flaw allows attackers to steal sensitive information like admin passwords, mail server credentials, and license keys. A remote attacker could exploit the vulnerability by sending a crafted request to the target service. Successful exploitation could result in the disclosure of sensitive information.
Strike Apache Struts HttpParameters.java Unrestricted File Upload	CWE: 552 CVE: 2023-50164	This strike exploits a directory traversal vulnerability in Apache Struts framework. The vulnerability is due to insufficient validation of HTTP parameters during file uploads to the "upload.action" endpoint, resulting in unrestricted file uploads. The vulnerability allows an attacker to manipulate file upload parameters to enable path traversal and upload a malicious file to the target server leading to remote code execution, gaining full system control. *NOTE: While running the strike in one-arm mode, poc.txt file gets created in the /tmp directory of the vulnerable server.
Strike Apache OFBiz Authentication Bypass	CWE: 918 CVE: 2023-51467	This strike exploits an authentication bypass vulnerability in Apache OFBiz. This vulnerability is due to improper input validation of the credentials by the checkLogin function. A remote, unauthenticated attacker could exploit this vulnerability by sending a request with null or invalid username and password parameters and the requirePasswordChange parameter as Y to the server. Successfully exploiting this vulnerability could result in remote code execution in the security context of the web server running the vulnerable application.

Name	References	Description
Strike Apache Kafka Groovy Script Remote Code Execution	CWE: 94 CVE: 2023-52251	This strike exploits a command injection vulnerability in the web component of Apache Kafka. The vulnerability is due to unrestricted Groovy script execution within the smart filter functionality. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request and might result in arbitrary command execution under the security context of the kafkaui user.
Strike WordPress Backup Migration Plugin Remote Code Execution Vulnerability	CVE: 2023-6553	This strike exploits a remote code execution vulnerability in the WordPress Backup Migration plugin. The vulnerability arises from improper input validation in the backup-heart.php script. A remote, unauthenticated attacker could leverage this flaw by sending a specially crafted HTTP POST request, potentially leading to the execution of arbitrary PHP code on the target server.
Strike MLflow get-artifact Local File Read Vulnerability	CWE: 29 CVE: 2023-6909	This strike exploits a Local File Inclusion (LFI) vulnerability in the MLflow framework, which is hosted in the GitHub repository mlflow/mlflow. MLflow is a platform designed to streamline machine learning development, including tracking experiments, packaging code into reproducible runs, and sharing and deploying models. The vulnerability arises from improper handling of URL paths containing directory traversal characters when associating runs with experiments, allowing remote unauthenticated attackers to read arbitrary files on the server. The issue arises from a URI parsing confusion, which allows attackers to manipulate the artifact_location parameter during the creation of an experiment. This can lead to the unintended inclusion of sensitive files like /etc/passwd. Successful exploitation could result in the disclosure of sensitive information.
Strike Palo Alto Networks PAN-OS Management Interface Authentication Bypass	CWE: 306 CVE: 2024-0012	This strike exploits a Authentication Bypass vulnerability in Palo Alto Networks PAN-OS. The vulnerability is due to missing authentication to a critical path. A remote, unauthenticated attacker can exploit by sending a crafted HTTP request to the management web interface. Successful exploitation could result in information disclosure.
Strike Centreon Web updateDirectory SQL Injection Vulnerability	CVE: 2024-0637	This strike exploits an SQL injection vulnerability in the Centreon Web module. The vulnerability exists due to improper input validation in the updateDirectory function when processing the dir_id parameter. A remote, authenticated attacker could leverage this flaw by sending a specially crafted request, leading to arbitrary SQL command execution on the target database.
Strike Progress Kemp LoadMaster REST API Improper Input Validation	CVE: 2024-1212 CWE: 78	This strike exploits an Improper Input Validation Vulnerability against Progress Kemp LoadMaster. This vulnerability is due to improper user input validation when processing REST API requests. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to a target server. Successful exploitation can lead to arbitrary command execution.
Strike ConnectWise ScreenConnect SetupModule Authentication Bypass	CWE: 288 CVE: 2024-1709	This strike exploits an authentication bypass vulnerability in ConnectWise ScreenConnect. The vulnerability is due to improper validation of a request URL. A remote attacker could exploit this vulnerability by sending a crafted request to the target server, which will not match the expected value and the comparison will return false, allowing processing of the request to continue. Successful exploitation could result in privilege escalation.

Name	References	Description
Strike Atlassian Confluence Data Center and Server addlanguage Remote Code Execution	CWE: 94 CVE: 2024-21683	This strike exploits a remote code execution vulnerability in the Confluence Data Center and Server. The vulnerability is due to insufficient input validation in the function that allows users to add new code block macro language definitions. This flaw allows an authenticated attacker to inject and execute arbitrary Java code by uploading a malicious language file. A remote, authenticated attacker could leverage this vulnerability to inject Java code, resulting in arbitrary code execution under the security context of the user running the vulnerable application. *Note : While running the strike in one-arm mode, it creates a file /tmp/test on the target server.
Strike Ivanti Connect Secure and Policy Secure Gateways Command Injection	CWE: 77 CVE: 2024-21887	This strike exploits a command injection vulnerability in the web components of Ivanti Connect Secure and Ivanti Policy Secure Gateways. This vulnerability is due to the insufficient validation of HTTP arguments. In the web application, two different paths are susceptible to system command injection. The user-submitted data is directly employed in the Python Popen function without undergoing any sanitization. Consequently, an attacker can inject ";command;" and execute shell commands. A remote authenticated attacker could exploit this vulnerability by sending a crafted request to a target server. Successful exploitation could result in arbitrary shell command execution under the security context of the root user.
Strike Ivanti Connect Secure, Policy Secure, and Neurons Server-Side Request Forgery Vulnerability	CWE: 918 CVE: 2024-21893	This strike exploits a Server Side Request Forgery (SSRF) vulnerability in the SAML component of Ivanti Connect Secure, Ivanti Policy Secure, and Ivanti Neurons. The vulnerability arises from insufficient validation of XML content processed by the SAML server, which utilizes an outdated xmltooling library. The URI attribute of the RetrievalMethod element of the XML SOAP allows requests for remote resources via an HTTP GET request, leading to SSRF attacks. A remote, unauthenticated attacker could exploit this vulnerability to access restricted resources. This vulnerability when chained with CVE-2024-21887 may lead to remote code execution.
Strike Centreon Web updateLCARelation SQL Injection Vulnerability	CVE: 2024-23116	This strike exploits an SQL injection vulnerability in the Centreon Web module. The vulnerability exists due to insufficient input validation in the updateLCARelation function when processing the acl_r_topos parameter. A remote, authenticated attacker could leverage this flaw to execute arbitrary SQL commands on the target server's database.
Strike Centreon Web updateContactServiceCommands SQL Injection Vulnerability	CVE: 2024-23117	This strike exploits an SQL injection vulnerability in the Centreon Web module. The vulnerability exists due to insufficient input validation in the updateContactServiceCommands function when processing the contact_svNotifCmds[] parameter. Exploiting this vulnerability allows a remote, authenticated attacker to execute arbitrary SQL commands on the target database, potentially compromising its integrity and security.

Name	References	Description
Strike Rejetto HTTP File Server Template Injection Vulnerability	CWE: 94 CVE: 2024-23692	This strike exploits a server-side template injection vulnerability in Rejetto HTTP File Server. The vulnerability arises from improper handling of the search query parameter within the server's default template, which processes user-supplied content without adequate escaping. Attackers can exploit this flaw to inject arbitrary macros or commands, potentially compromising the system. Successful exploitation allows unauthenticated remote attackers to execute code with the privileges of the user running the HFS server.
Strike Windows CreateProcess cmd.exe Command Injection Vulnerability	CWE: 78 CVE: 2024-24576 CVE: 2024-1874 CVE: 2024-3566	This strike exploits a command injection vulnerability in Windows. The vulnerability arises from improper escaping of arguments when invoking batch files ('bat' and 'cmd' extensions) by the standard libraries across various programming languages. As a result, the Windows command shell (cmd.exe) can be manipulated into executing malicious code. Multiple CVEs are tied to this vulnerability (CVE-2024-24576, CVE-2024-3566, CVE-2024-1874, CVE-2024-22423), however, they all exploit the same underlying weakness. A remote, unauthenticated attacker could exploit this vulnerability by controlling the arguments passed to the spawned process. Successful exploitation could lead to the execution of arbitrary shell commands, bypassing the escaping mechanism, and operating within the security context of the target server.
Strike Check Point Quantum Security Gateways Information Disclosure Vulnerability	CWE: 200 CVE: 2024-24919	This strike exploits a directory traversal vulnerability in Check Point Quantum Security Gateways, affecting systems with Remote Access VPN or Mobile Access Software Blades enabled. The vulnerability is due to improper sanitization and validation of user input in the '/clients/MyCRL' endpoint. A remote, unauthenticated attacker could exploit this vulnerability by sending a specially crafted POST request to the vulnerable endpoint containing the string 'CSHELL/' and a path traversal sequence, which could disclose sensitive information, including files containing password hashes.
Strike JetBrains TeamCity BaseController Authentication Bypass Vulnerability	CWE: 288 CVE: 2024-27198	This strike exploits an authentication bypass vulnerability in JetBrains TeamCity. The vulnerability is due to an authentication weakness in the BaseController class, which allows unauthenticated users to access restricted endpoints. It results from inadequate validation of parameters such as the "jsp" parameter and the ".jsp" extension in URLs. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server. Successful exploitation could result in an attacker bypassing the server's authentication mechanisms, in the worst case, leading to remote code execution under the security context of the target server.
Strike JetBrains TeamCity Authentication Bypass Vulnerability	CWE: 23 CVE: 2024-27199	This strike exploits an authentication bypass vulnerability in JetBrains TeamCity. This vulnerability allows an unauthenticated attacker to access certain authenticated endpoints without proper authentication. By exploiting path traversal issues in specific paths like /res/, /update/, and /.well-known/acme-challenge/, an attacker can reach sensitive JSP pages and servlet endpoints, leading to information disclosure and potential modification of system settings. A remote, unauthenticated attacker could execute denial-of-service attacks by changing the HTTPS port number or uploading a certificate that fails client-side validation, potentially enabling eavesdropping or man-in-the-middle attacks.

Name	References	Description
Strike Apache HugeGraph-Server Improper Access Control Vulnerability	CWE: 284 CVE: 2024-27348	This strike exploits an improper access control vulnerability in Apache Hugegraph. The flaw exists in the Gremlin query language endpoint. Improper validation and insufficient filtering of reflection methods allow attackers to bypass sandbox restrictions and execute arbitrary code remotely. A remote, unauthenticated attacker could exploit this vulnerability by crafting a malicious Gremlin query that bypasses security checks in the HugeGraph Server. *Note : While running the strike in one-arm mode, it creates a file /tmp/poc on the target server.
Strike SolarWinds Web Help Desk Hard-Coded Credentials	CWE: 798 CVE: 2024-28987	This strike exploits an information disclosure vulnerability in SolarWinds Web Help Desk. This vulnerability is due to hardcoded credentials. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted request to the target server and could result in information disclosure.
Strike SolarWinds Serv-U Path Traversal Vulnerability	CWE: 22 CVE: 2024-28995	This strike exploits a directory traversal vulnerability in the SolarWinds Serv-U file transfer solution. The vulnerability arises due to improper validation of two user input HTTP parameters InternalDir and InternalFile. These parameters are checked for directory traversal sequences but fail to account for different path separators. Attackers can exploit this by using forward slashes instead of backslashes, and vice versa, bypassing the check and allowing traversal to arbitrary directories. This vulnerability enables remote, unauthenticated attackers to access sensitive files and potentially further compromise the system.
Strike MLflow URI Parsing Confusion Local File Read Vulnerability	CWE: 29 CVE: 2024-2928	This strike exploits a Local File Inclusion (LFI) vulnerability in the MLflow framework, which is hosted in the GitHub repository mlflow/mlflow. The vulnerability arises from improper handling of URL paths containing directory traversal characters when associating runs with experiments, allowing remote unauthenticated attackers to read arbitrary files on the server. A remote, unauthenticated attacker can exploit this flaw by manipulating the fragment part of the URI to read arbitrary files on the local file system, including sensitive files like '/etc/passwd'. The vulnerability is a bypass to a previous patch CVE-2023-6909 that addressed similar manipulation within the URI's query string. Successful exploitation could result in the disclosure of sensitive information.
Strike Ivanti Endpoint Manager (EPM) xp_cmdshell SQL Injection Vulnerability	CWE: 89 CVE: 2024-29824	This strike exploits an SQL injection vulnerability in Ivanti Endpoint Manager (EPM). The vulnerability lies in the RecordGoodApp() function, where an unsanitized md5 value provided by the user is used in an SQL query. Attackers can exploit this by sending a crafted SOAP request, injecting SQL commands, such as xp_cmdshell, to execute malicious code. Successful exploitation of this vulnerability could allow an unauthenticated attacker within the same network to execute arbitrary code.
Strike Apache OFBiz Path Traversal Vulnerability	CWE: 22 CVE: 2024-32113	This strike exploits a path traversal vulnerability in Apache OFBiz. The vulnerability arises from inadequate sanitization of input at the vulnerable endpoint /webtools/control/forgotPassword. An attacker can exploit this endpoint to access the ProgramExport functionality, which can then be leveraged for remote code execution. Successful exploitation allows unauthenticated remote attackers to execute arbitrary code with the privileges of the user running the vulnerable server.

Name	References	Description
Strike D-Link nas_sharing Hardcoded Credentials	CVE: 2024-3272 CWE: 798	This strike exploits an authentication bypass vulnerability in D-Link NAS sharing. The vulnerability is due to the use of hardcoded credentials in nas_sharing. By sending a crafted request, an attacker can bypass authentication.
Strike D-Link nas_sharing Remote Code Execution	CVE: 2024-3273 CWE: 77	This strike exploits a command injection vulnerability in D-Link NAS sharing. The vulnerability is due to improper sanitization of user provided parameter in nas_sharing. By sending a crafted request, an attacker can execute arbitrary command on the system in the context of the running service.
Strike Palo Alto Networks PAN-OS Command Injection Vulnerability	CWE: 77 CVE: 2024-3400	This strike exploits a command injection vulnerability in Palo Alto Networks PAN-OS. The vulnerability is due to insufficient validation of user data by the GlobalProtect service. When parsing the SESSID cookie, the value is not verified to be a valid UUID. A remote, unauthenticated attacker could exploit this vulnerability by sending a crafted SESSID value, including directory traversal and shell command characters to the target service. Successful exploitation would result in the execution of arbitrary commands under the security context of the ROOT user.
Strike Adobe Commerce and Magento Improper Restriction of XML External Entity Reference (XXE) Vulnerability	CWE: 611 CVE: 2024-34102	This strike exploits an XML External Entity Injection vulnerability in Adobe Commerce and Magento. The vulnerability is due to improper validation during deserialization of user-supplied XML data. When deserializing XML payloads, the parser processes external entities embedded within the XML structure. A remote, unauthenticated attacker could exploit this vulnerability by injecting maliciously crafted XML that references external entities, enabling them to access or tamper with sensitive server-side data. Successful exploitation of this vulnerability could lead to disclosure of sensitive information.
Strike Apache OFBiz Directory Traversal Vulnerability	CVE: 2024-36104	This strike exploits a directory traversal vulnerability in Apache OFBiz. The vulnerability exists due to improper validation of URL data when processing HTTP requests. A remote, unauthenticated attacker can leverage this flaw by sending specially crafted requests, potentially bypassing authentication or executing arbitrary OS commands on the affected server.
Strike OSGeo GeoServer GeoTools Eval Injection Vulnerability	CWE: 94 CVE: 2024-36401	This strike exploits a command injection vulnerability in Geoserver. The vulnerability arises from the unsafe evaluation of XPath expressions in the GeoTools library. This evaluation is erroneously applied to both complex and simple feature types, making all GeoServer instances vulnerable. The vulnerability can be exploited through various OGC (Open Geospatial Consortium) request parameters like WFS GetPropertyValue. Successful exploitation of this vulnerability could lead to unauthenticated remote code execution on the affected GeoServer instances, potentially leading to full server compromise. *Note : While running the strike in one-arm mode, it creates two files /tmp/test1 and /tmp/test2 on the target server.

Name	References	Description
Strike Apache OFBiz ProgramExport Incorrect Authorization Vulnerability	CWE: 863 CVE: 2024-38856	This strike exploits an incorrect authorization vulnerability in Apache OFBiz. The vulnerability arises from a logic flaw in the authentication of endpoints. Authentication is performed on the requestUri, which points to an endpoint that does not require authentication, such as 'forgotPassword'. However, the page located at overrideViewUri is rendered instead. This flaw allows unauthenticated access to the ProgramExport endpoint by chaining it with any other endpoints that do not require authentication. By leveraging this override view functionality, an attacker can achieve remote code execution. Successful exploitation allows unauthenticated remote attackers to execute arbitrary code with the privileges of the user running the vulnerable server. *Note: While running the strike in one-arm mode, it creates a file /tmp/test on the vulnerable server.
Strike CrushFTP Server Side Template Injection Vulnerability	CWE: 94 CVE: 2024-4040	This strike exploits a server side template injection vulnerability in CrushFTP. The vulnerability arises from inadequate input validation and improper handling of user-supplied data in the code responsible for variable replacement in API responses, enabling attackers to inject and execute arbitrary templates. To exploit the vulnerability, attackers can leverage the server-side templating engine of CrushFTP by injecting malicious templates into API responses. This allows an unauthenticated remote attacker to read files from the file system outside of the Virtual File System (VFS) Sandbox, bypass authentication to gain administrative access, and perform remote code execution on the server.
Strike Veertu Anka Build Directory Traversal Vulnerability	CVE: 2024-41163	This strike exploits a directory traversal vulnerability in Veertu Anka Build. The vulnerability exists due to insufficient validation of the "service" parameter in the archive API endpoint. A remote, unauthenticated attacker could leverage this flaw by sending a specially crafted request, enabling them to access and read arbitrary files from the target server.
Strike Mitel MiCollab Path Traversal Vulnerability	CWE: 22 CVE: 2024-41713	This strike exploits a path traversal vulnerability in Mitel MiCollab. A remote unauthenticated attacker can conduct a path traversal attack due to insufficient input validation. Successful exploitation could allow unauthorized access, and the ability to read arbitrary files on the server.
Strike Apache OFBiz Forced Browsing Vulnerability	CWE: 425 CVE: 2024-45195	This strike exploits a forced browsing vulnerability in Apache OFBiz. The vulnerability is due to improper access control in the web application. A remote attacker could exploit this vulnerability by sending a crafted HTTP POST request to the targeted server. Successful exploitation could result in unauthorized access to sensitive information.
Strike PHP-CGI OS Command Injection Vulnerability	CWE: 78 CVE: 2024-4577	This strike exploits an OS command injection vulnerability in PHP-CGI on Windows. The vulnerability is due to the improper handling of character encoding conversions within the Windows operating system, particularly the "Best Fit" feature to replace characters in command line given to Win32 API functions. The PHP CGI module may misinterpret those characters as PHP options, which may allow a malicious user to pass options to the PHP binary being run. As a result, remote, unauthenticated attackers can inject arguments into the PHP CGI process, leading to arbitrary code execution.

Name	References	Description
Strike ServiceNow Improper Input Validation Vulnerability	CWE: 1287 CVE: 2024-4879	This strike exploits a Jelly template injection vulnerability in ServiceNow platform. The vulnerability arises from improper input validation in the Jelly scripting engine, which is used within ServiceNow for rendering dynamic content. A remote, unauthenticated attacker can exploit this vulnerability by crafting a malicious input that the Jelly engine processes incorrectly, leading to remote code execution. Successful exploitation can result in complete compromise of the affected ServiceNow instance, allowing attackers to execute arbitrary commands, access sensitive information, and potentially manipulate system settings.
Strike Aviatrix Controller OS Command Injection Vulnerability	CVE: 2024-50603 CWE: 78	This strike exploits an OS command injection vulnerability in Aviatrix Controller. The vulnerability allows unauthenticated remote attackers to inject shell metacharacters into the /v1/api endpoint via the cloud_type parameter in list_flightpath_destination_instances or the src_cloud_type parameter in flightpath_connection_test. Successful exploitation of the vulnerability allows remote attackers to execute arbitrary commands on the affected system.
Strike Cleo Harmony VLTrader Lexicom File Upload Vulnerability	CVE: 2024-50623 CWE: 434	This strike exploits a file upload vulnerability in Cleo Harmony, VLTrader, Lexicom. The vulnerability allows unauthenticated attackers to upload malicious files, which can then be exploited via directory traversal to execute arbitrary code. Successful exploitation of this vulnerability allows remote attackers to access sensitive information, modify data, or disrupt system operations.
Strike Cyber Panel Getresetstatus Remote Code Execution	CWE: 78 CVE: 2024-51378	This strike exploits a command injection vulnerability in the web component of Cyber Panel. The vulnerability is due to missing authentication for critical function. The getresetstatus endpoint of CyberPanel allows remote unauthenticated attackers to execute arbitrary commands by bypassing secMiddleware protections. The vulnerability can be exploited using shell metacharacters in the statusfile parameter. Successful exploitation could result in arbitrary command execution under the security context of the root user.
Strike Cyber Panel upgrademysqlstatus Remote Code Execution	CWE: 306 CVE: 2024-51567	This strike exploits a command injection vulnerability in the web component of Cyber Panel. The vulnerability is due to missing authentication for critical function. The upgrademysqlstatus endpoint of CyberPanel allows remote unauthenticated attackers to execute arbitrary commands by bypassing secMiddleware protections, which only filter POST requests. The vulnerability can be exploited using shell metacharacters in the statusfile parameter. Successful exploitation could result in arbitrary command execution under the security context of the root user.
Strike ServiceNow Incomplete List of Disallowed Inputs Vulnerability	CWE: 697 CVE: 2024-5217	This strike exploits a Jelly template injection vulnerability in ServiceNow platform. The vulnerability arises from improper input validation in the Jelly scripting engine, which is used within ServiceNow for rendering dynamic content. A remote, unauthenticated attacker can exploit this vulnerability by providing crafted malicious input that the Jelly engine processes incorrectly. This leads to the disclosure of sensitive information, including database details. Successful exploitation could result in unauthorized access to sensitive database details within the affected ServiceNow instance.

Name	References	Description
Strike Apache Struts FileuploadIntercept or Unrestricted File Upload	CWE: 434 CVE: 2024-53677	This strike exploits a file upload vulnerability in Apache Struts 2 framework. The vulnerability lies in the File Upload Interceptor, which allows attackers to exploit improperly sanitized file names containing path traversal sequences. This can lead to arbitrary file writes, enabling remote code execution (RCE) in vulnerable applications. The exploitation involves manipulating field name capitalization in file upload forms to bypass Struts 2's parameter binding, allowing attackers to control internal variables like top.uploadFileName via the OGNL value stack. Exploitation is customized, requiring knowledge of the upload endpoint's structure.
Strike Ivanti Cloud Services Appliance OS Command Injection Vulnerability	CWE: 78 CVE: 2024-8190	This strike exploits an OS command injection vulnerability in the Ivanti Cloud Services Appliance, versions prior to 4.6 Patch 519. This vulnerability is due to improper validation of user data sent to the datetime php endpoint. Successful exploitation might result in arbitrary code execution in the context of the root user.
Strike Ivanti Cloud Services Appliance broker Authentication Bypass	CWE: 22 CVE: 2024-8963	This strike exploits Authentication Bypass vulnerability in Ivanti Cloud Services Appliance. A remote, unauthenticated attacker could exploit this vulnerability by sending crafted requests to the target server. Successful exploitation could allow an unauthorized attacker to access restricted functionality.
Strike Palo Alto Networks Expedition OS Command Injection Vulnerability	CVE: 2024-9463 CWE: 78	This strike exploits an OS command injection vulnerability in Palo Alto Networks Expedition. The vulnerability is due to lack of neutralization of special elements used in OS commands. A remote unauthenticated attacker can exploit this vulnerability by running arbitrary OS commands as root. Successful exploitation of this vulnerability could lead to remote code execution.
Strike Langflow Code Validation Missing Authentication Vulnerability	CWE: 94 CVE: 2025-3248	This strike exploits a missing authentication vulnerability in Langflow. The vulnerability is due to lack of authentication in /api/v1/validate/code endpoint. A remote, unauthenticated attacker could exploit this vulnerability by embedding malicious Python code in function decorator or default argument. Successfully exploiting this vulnerability can lead to execution of arbitrary code under the security context of the service.
Strike CVSTrac FileDiff v2 Parameter Command Execution	CVE: 2004-1456 BID: 10878	This strike exploits an arbitrary command execution vulnerability in CVSTrac. The vulnerability is due to failure to properly sanitize user-supplied input to the rcsinfo parameter. A remote attacker could execute arbitrary commands on the target system by sending shell metacharacters in a web request.
Strike Cybozu ag.exe id Parameter Directory Traversal	BID: 19733 CVE: 2006-4490	This strike exploits a directory traversal vulnerability in the Cybozu web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Cybozu s360.exe id Parameter Directory Traversal Variant 1	BID: 19733  CVE: 2006-4490	This strike exploits a directory traversal vulnerability in the Cybozu web application.
Strike Cybozu s360.exe id Parameter Directory Traversal Variant 2	BID: 19733  CVE: 2006-4490	This strike exploits a directory traversal vulnerability in the Cybozu web application.
Strike Data Dynamics ActiveX Save Method Arbitrary File Write	CVE: 2007-3883  BID: 24959	This strike exploits an arbitrary file write bug in the Data Dynamics ActiveX control when calling the Save method.
Strike Data Dynamics ActiveX SaveLayoutChanges Method Arbitrary File Write	CVE: 2007-3883  BID: 24959	This strike exploits an arbitrary file write bug in the Data Dynamics ActiveX control when calling the SaveLayoutChanges method.
Strike Data Dynamics ActiveX SaveMenuUsageData Method Arbitrary File Write	CVE: 2007-3883  BID: 24959	This strike exploits an arbitrary file write bug in the Data Dynamics ActiveX control when calling the SaveMenuUsageData method.
Strike DBGuestBook utils.php dbs_base_path Parameter PHP File Include	CWE: 94  CVE: 2007-1165  BID: 22658	This strike exploits a PHP include flaw in the DBGuestBook application.
Strike DBGuestBook guestbook.php dbs_base_path Parameter PHP File Include	CWE: 94  CVE: 2007-1165  BID: 22658	This strike exploits a PHP include flaw in the DBGuestBook application.
Strike DBGuestBook views.php dbs_base_path Parameter PHP File Include	CWE: 94  CVE: 2007-1165  BID: 22658	This strike exploits a PHP include flaw in the DBGuestBook application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Dell KACE K1000 krash rpt OS Command Injection	EXPLOITDB : 46684	An OS command injection vulnerability exists in Dell KACE K1000 versions before 6.4.120822, due to lack of sanitization of user-supplied data. By sending a crafted 'kuid' parameter in a HTTP request to '/service/krash rpt.php', a remote unauthenticated attacker may execute arbitrary OS commands as the user 'www'.
Strike DivX ActiveX Browser Plugin Denial of Service	BID: 22133  CVE: 2007-0429	This strike causes a denial of service in the DivX browser plugin's ActiveX control.
Strike D-Link DAP-1160 Authentication Bypass		A vulnerability exists in the D-Link DAP-1160 wireless access point that allows an attacker to gain unauthorized access to the administration page if the first url accessed in the first 40 seconds since the device web server has started is the url <a href="http://IP_ADDR/tools_firmw.htm">http://IP_ADDR/tools_firmw.htm</a> . This is especially dangerous since a separate vulnerability exists in the same device that allows an unauthenticated user to run commands remotely, such as rebooting the device (strike-id E10-0fa01).
Strike D-Link DIR8xx Information Disclosure	EXPLOITDB : 42729	This strike exploits a information disclosure vulnerability in D-Link DIR-8xx Wired/Wireless Router. This vulnerability is due to improper handling of key-value pairs sent through HTTP POST requests. By exploiting this vulnerability a remote, authenticated attacker can obtain sensitive data, including router credentials.
Strike Docker Daemon API Unauthorized Remote Code Execution		This strike exploits a remote code execution vulnerability in Docker daemon API. An attacker can start a docker container, attach host's /etc to the container and read/write files in etc.
Strike BerliOS Docpile we folder.class.php INIT_PATH Parameter PHP File Include	BID: 19428  CVE: 2006-4075	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike BerliOS Docpile we email.inc.php INIT_PATH Parameter PHP File Include	BID: 19428  CVE: 2006-4075	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike BerliOS Docpile we document.class.php INIT_PATH Parameter PHP File Include	BID: 19428  CVE: 2006-4075	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike BerliOS Docpile we auth.inc.php INIT_PATH Parameter PHP File Include	BID: 19428 CVE: 2006-4075	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike BerliOS Docpile we access.inc.php INIT_PATH Parameter PHP File Include	CVE: 2006-4076	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike BerliOS Docpile we folders.inc.php INIT_PATH Parameter PHP File Include	CVE: 2006-4076	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike BerliOS Docpile we init.inc.php INIT_PATH Parameter PHP File Include	CVE: 2006-4076	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike BerliOS Docpile we templates.inc.php INIT_PATH Parameter PHP File Include	CVE: 2006-4076	This strike exploits a PHP include flaw in the berliOS Docpile:we web application.
Strike Dolibarr ERP-CRM rowid SQL Injection	EXPLOITDB : 46095	This strike exploits an SQL injection vulnerability in Dolibarr ERP-CRM. The vulnerability is due to the improper sanitization of requests sent to the application. An attacker could exploit this by sending a specifically crafted 'rowid' parameter, potentially resulting in the execution of SQL commands which may lead to information disclosure.
Strike Microsoft DXMedia SDK 6 SourceUrl ActiveX Remote Code Execution	CVE: 2007-4336 BID: 25279	This strike exploits a vulnerability in a DXMedia ActiveX control.
Strike Easy File Sharing Web Server - sendmail.ghp Stack Buffer Overflow	EXPLOITDB : 42165	This strike exploits a stack buffer overflow vulnerability in Easy File Sharing Web Server. The vulnerability is due to a lack of boundary checking on user input when requesting sendmail.ghp resource. By exploiting this vulnerability, an attacker could execute arbitrary code in the security context of user. NOTE: Strike will launch calc.exe when run in OneArm mode. Verified against Easy File Sharing Web Server Version 7.2 running on Windows 7 x86 with DEP and ASLR disabled.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Easy File Sharing Web Server - vfolder.ghp Stack Buffer Overflow	EXPLOITDB : 42261	This strike exploits a stack buffer overflow vulnerability in Easy File Sharing Web Server. The vulnerability is due to a lack of boundary checking on user input when requesting vfolder.ghp resource. By exploiting this vulnerability, an attacker could potentially execute arbitrary code in the security context of user. NOTE: Strike will launch calc.exe when run in OneArm mode. Verified against Easy File Sharing Web Server Version 7.2 running on Windows 7 x86 with DEP disabled.
Strike EasyMail Object EMSMTP.DLL ActiveX Control Buffer Overflow	CWE: 119 CVE: 2007-4607 BID: 25467	This module exploits a buffer overflow in the EasyMail Object EMSMTP.DLL ActiveX Control.
Strike EMail Security Virtual Appliance Remote Code Execution		This strike exploits a failure to validate user-supplied data to execute remote instructions in an ESVA VM.
Strike Empire CMS checklevel.php check_path Parameter PHP File Include	CVE: 2006-4354 BID: 19655	This strike exploits a PHP include flaw in the Empire CMS web application.
Strike Electric Sheep Fencing pfSense Code Execution Vulnerability		This strike exploits a code execution vulnerability inside Electric Sheep Fencing pfSense. The vulnerability is due to improper HTTP POST parameter validation by the web interface. By exploiting this vulnerability an attacker could execute malicious scripts on the target machine.
Strike Microsoft Excel NULL Pointer DoS (A) (HTTP)	BID: 22717 CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Microsoft Excel NULL Pointer DoS (B) (HTTP)	BID: 22717 CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Drupal RESTful Web Services Module Default Page Callback Function Remote php Command Execution	EXPLOITDB : 40130	This strike exploits a command execution in the Drupal RESTful Web Services (RESTWS) Module. The RESTWS module checks requests to see if it references a callback function. If it does not have a default callback function, other arguments in the URL are handled as arguments, including an argument which is used as the callback function. This argument can be set to "system," allowing for command execution. An attacker can send a specially crafted HTTP request to achieve remote php command execution. Successful exploitation can result in the execution of arbitrary code with the privileges of the target Drupal server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike TOPSEC Firewall ELCO ELIGIBLECONTEST ANT Recon Probe	EXPLOITDB : 40272	This strike emulates a reconnaissance attack against TopSec Firewalls. This attack attempts several command executions to retrieve information from the target system. NOTE: By default the vulnerable services are accessed via SSL connection (port 443). A publicly available exploit for this vulnerability can be found in the reported leak of 0Day exploits from the NSA by a group known as the "Shadow Brokers", identified as ELIGIBLECONTESTANT.
Strike TOPSEC Firewall ELCO ELIGIBLECONTEST ANT Remote Code Execution	EXPLOITDB : 40272	This strike emulates a remote code execution attack against TopSec Firewalls. This attack uploads and executes arbitrary code via an HTTP POST request to /cgi/maincgi.cgi. NOTE: By default the vulnerable services are accessed via SSL connection (port 443). A publicly available exploit for this vulnerability can be found in the reported leak of 0Day exploits from the NSA by a group known as the "Shadow Brokers", identified as ELIGIBLECONTESTANT
Strike TOPSEC Firewall ELCA ELIGIBLECANDIDA TE Remote Code Execution	EXPLOITDB : 40273	This strike emulates a remote code execution attack against TopSec Firewalls. This attack uploads and executes arbitrary code via an HTTP POST request to /cgi/maincgi.cgi. NOTE: By default the vulnerable services are accessed via SSL connection (port 443). A publicly available exploit for this vulnerability can be found in the reported leak of 0Day exploits from the NSA by a group known as the "Shadow Brokers", identified as ELIGIBLECANDIDATE.
Strike FreePBX config display Parameter SQL Injection	EXPLOITDB : 40312	This strike exploits a SQL injection vulnerability in FreePBX. HTTP requests to /admin/config.php are not sanitized for SQL injection characters. A specially crafted HTTP request with a sql injection in the display parameter can be used to achieve arbitrary SQL statement execution, which can lead to arbitrary code execution with the mysql user privileges.
Strike WordPress Quizlord plugin Reflected Cross Site Scripting	EXPLOITDB : 45307	This strike exploits a reflected cross-site scripting vulnerability found in Quizlord WordPress plugin. This vulnerability is due to inadequate input filtering in the web interface, while parsing input passed to quiz title parameter. By exploiting this vulnerability an attacker could cause arbitrary HTML/script code to be executed by the target user's browser.
Strike Windows Explorer ICO File Format Divide by Zero	BID: 24346  CVE: 2007-2237	This strike exploits a denial of service flaw in the Windows Explorer using a Windows icon file (ICO) with an image height field set to zero.
Strike Facebook PhotoUploader 4 Buffer Overflow	CWE: 119  CVE: 2008-0660  BID: 27576	This strike exploits a buffer overflow vulnerability present in the Facebook ImageUploader ActiveX library created by Aurigma, and used by Facebook, MySpace, and others. Due to an issue involving improper bounds-checking, a malicious web page can use the ExtractIptc and ExtractExif functions to overflow the buffer, leading to system instability and the possibility of remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike FCRing FCRing.php s_fuss Parameter PHP File Include	CVE: 2007-1133  BID: 22693	This strike exploits a PHP include flaw in the FCRing web ring application.
Strike FireEye OS Remote File Disclosure	EXPLOITDB : 38090	This strike exploits a remote file disclosure vulnerability in FireEye OS. The vulnerability is due to improper filtering of HTTP parameters. By using a specially crafted GET request an attacker can cause the web server to return the contents of arbitrary files. NOTE: This strike runs by default over SSL (port 443).
Strike Firefox Array.reduceRight Integer Overflow	CWE: 189  CVE: 2011-2371  BID: 48372	This strike exploits an integer overflow vulnerability in Mozilla Firefox <= 3.6.18 that occurs when using the reduceRight method on an array with a very large length.
Strike Firefox Asynchronous Event Memory Corruption	CWE: 264  CVE: 2006-4253  BID: 19488	This strike exploits a flaw in Firefox that results in the corruption of memory and denial of service
Strike Mozilla Firefox SVG Surface Integer Overflow	CVE: 2006-0297  BID: 16476	This strike exploits a memory corruption vulnerability in Mozilla Firefox that occurs when a specific surface size is used in a SVG image.
Strike Incorrect libpng Usage (Extra Row) Heap Overflow	BID: 41174  CWE: 119  CVE: 2010-1205	This strike exploits a vulnerability in the way applications make use of the libpng library. Libpng uses callbacks to inform the application that data has been parsed and is available. If an application using libpng does not keep track of the number of rows parsed in the callbacks and continues to write the parsed pixel data into a buffer, a heap overflow can occur. Firefox (1.5.x and up) and Google Chrome (all) are known to be vulnerable.
Strike Mozilla Firefox CSS Border Width Memory Corruption	CWE: 119  CVE: 2006-1739  BID: 17516	This strike exploits a vulnerability in Mozilla Firefox when handling CSS that specifies large values for borders.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Firefox CSS Layout Memory Corruption	CVE: 2007-3734 BID: 24946	This strike exploits a memory corruption vulnerability in Mozilla Firefox when rendering HTML that tries to reference deleted style information for a parent block.
Strike Firefox nsTreeContentView Use After Free	CWE: 399 CVE: 2010-0176 BID: 39128	This strike triggers a use-after-free (dangling pointer) vulnerability in the Firefox web browser by including non-xul elements as children of a xul element. Versions prior to 3.6.2, 3.5.9, and 3.0.19 are vulnerable.
Strike Mozilla Firefox designMode Deleted Object Reference Denial of Service Variant 1	CWE: 399 CVE: 2006-1993 BID: 17671	This strike exploits a denial of service flaw in Mozilla Firefox when referencing a deleted controller context when designMode is enabled.
Strike Mozilla Firefox designMode Deleted Object Reference Denial of Service Variant 2	CWE: 399 CVE: 2006-1993 BID: 17671	This strike exploits a denial of service flaw in Mozilla Firefox when referencing a deleted controller context when designMode is enabled.
Strike Mozilla Firefox Design Mode Deleted Style Reference Memory Corruption	CVE: 2007-3734 BID: 24946	This strike exploits a memory corruption vulnerability in Mozilla Firefox when operating in design mode to edit objects with crafted style attributes.
Strike Mozilla Firefox OBJECT Tag Crafted Style Null Dereference	CVE: 2007-3734 BID: 24946	This strike exploits a denial of service vulnerability in Mozilla Firefox when rendering an HTML OBJECT tag whose display style is set with a crafted value.
Strike Mozilla Firefox document.write() Buffer Overflow	CWE: 119 CVE: 2010-3179	This strike exploits a bug in Mozilla Firefox where using the document.write() method with extremely large messages can overflow a buffer and cause an arbitrary address to be written to the call stack.

Name	References	Description
Strike Firefox document.write() and appendChild() Memory Corruption	CWE: 119 CVE: 2010-3765 BID: 44425	This strike exploits a memory corruption vulnerability in Mozilla Firefox 3.5.15 and 3.6.12 that occurs when mixing calls to document.write() and node.appendChild().
Strike Mozilla Firefox escape() Return Value Memory Corruption	CWE: 94 CVE: 2009-2477 BID: 35660	This strike exploits a memory corruption in the Mozilla Firefox 3.5 Just-in-time Javascript compiler when calling the escape() function.
Strike Mozilla Firefox Floating Layer Column Layout Denial of Service	CVE: 2007-0775 BID: 22694	This strike exploits a denial of service condition in Mozilla Firefox when dynamically creating a new DOM node inside a floating layer with a columnar layout.
Strike Mozilla Firefox GeckoActiveXObject( ) Method Denial of Service	CVE: 2006-3803 BID: 19181	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling javascript that passes a long string to the GeckoActiveXObject() method.
Strike Mozilla Firefox HTML Frameset Dynamic Resize Memory Corruption	CWE: 119 CVE: 2007-2867 BID: 24242	This strike exploits a bug in Mozilla Firefox when modifying size attributes of a frameset dynamically.
Strike Firefox HTML URL Unicode Stack Overflow	BID: 31397 CWE: 119 CVE: 2008-0016	This strike exploits a stack overflow with an SEH overwrite in Firefox versions 2.0.0.16 and lower when an invalid URL segment is passed to ConvertUTF8toUTF16::write.
Strike Firefox Hyphenated URL Exploit Variant 2	BID: 14784 CVE: 2005-2871	This strike exploits a flaw in the Firefox browser that is triggered by a hostname in a URL that is all hyphens.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Firefox-Thunderbird-SeaMonkey Javascript IDBKeyRange	BID: 53220 CWE: 399 CVE: 2012-0469	This strike exploits a use after free vulnerability in Mozilla Firefox/Thunderbird/SeaMonkey with IDBKeyRange object use after free.
Strike Mozilla Firefox InstallTrigger.install() Method Denial of Service	CWE: 399 CVE: 2006-1790 BID: 17516	This strike exploits a denial of service vulnerability in Mozilla Firefox when handling Javascript that calls the InstallTrigger.install() method.
Strike Mozilla Firefox Javascript UTF-8 Byte-order Marker Character Stripping	BID: 31346 CWE: 79 CVE: 2008-4065	This strike exploits a javascript parsing vulnerability in Mozilla Firefox. The browser incorrectly strips UTF-8 byte-order marker bytes when processing javascript.
Strike Mozilla Firefox Javascript Engine Function Arguments Memory Corruption	CWE: 189 CVE: 2006-3806 BID: 19181	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript code that passes many arguments to a function.
Strike Mozilla Firefox Javascript Engine ClearWatchPoint Memory Corruption	CWE: 119 CVE: 2007-0777 BID: 22694	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript that removes a watchpoint which is later referenced.
Strike Mozilla Firefox Javascript Engine 64k Atoms Memory Corruption	CWE: 119 CVE: 2007-0777 BID: 22694	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript code that contains more than 64k atoms.
Strike Mozilla Firefox Javascript Engine Object Getter Method Memory Corruption	CWE: 119 CVE: 2007-0777 BID: 22694	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript code involving calls to object getter methods for objects that have been garbage-collected.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Firefox Javascript Engine Memory Corruption (Script.toSource)	CWE: 119 CVE: 2007-0777 BID: 22694	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript code that calls toSource() on a script object that has been compiled.
Strike Mozilla Firefox Javascript Engine Memory Corruption (Script.toString)	CWE: 119 CVE: 2007-0777 BID: 22694	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript code that calls toString() on a script object that has been compiled.
Strike Mozilla Firefox Event Handler Privilege Escalation	CVE: 2007-3737 BID: 24946	This strike exploits a privilege escalation flaw that allows DOM eventhandlers to run code with chrome privileges.
Strike Mozilla Firefox Javascript HTML Escaped Low Surrogate Characters	BID: 31346 CWE: 79 CVE: 2008-4066	This strike exploits a javascript parsing vulnerability in Mozilla Firefox. The browser incorrectly strips certain HTML-escaped low surrogate characters.
Strike Mozilla Firefox New Function Garbage Collection Denial of Service (Firefox Javascript SetPrivate)	CVE: 2006-3803 BID: 19181	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling Javascript that references a garbage-collected variable.
Strike Mozilla Firefox Javascript Large Regular Expression Parsing Memory Corruption	CWE: 189 CVE: 2006-1737 BID: 17516	This strike exploits a memory corruption vulnerability in Mozilla Firefox when parsing large regular expressions.
Strike Firefox CSS letter-spacing Property Memory Corruption (Privilege Escalation)	CVE: 2006-1734 BID: 17516	This strike exploits a vulnerability in Mozilla Firefox that permits Javascript code to access internal function objects.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Firefox Javascript XBL.method.eval Variant 1	CWE: 264 CVE: 2006-1735 BID: 17516	This strike exploits a vulnerability in the Mozilla Firefox javascript engine that permits javascript to run scripts with local user permission.
Strike Mozilla Firefox Javascript XBL Compilation Scope Access	CWE: 264 CVE: 2006-1733 BID: 17516	This strike exploits a vulnerability in the Mozilla Firefox javascript engine that permits javascript to access the XBL compilation scope.
Strike Mozilla Firefox Javascript XBL Compilation Scope Access Variant 1	CWE: 264 CVE: 2006-1733 BID: 17516	This strike exploits a vulnerability in the Mozilla Firefox javascript engine that permits javascript to access the XBL compilation scope.
Strike Mozilla Firefox Javascript XBL Compilation Scope Access Variant 2	CWE: 264 CVE: 2006-1733 BID: 17516	This strike exploits a vulnerability in the Mozilla Firefox javascript engine that permits javascript to access the XBL compilation scope.
Strike Firefox Javascript Engine Multibyte Character Escape Heap Overflow	CVE: 2005-2705 BID: 14917	This strike exploits a vulnerability in the Firefox that is triggered when escaping multibyte-character strings in Javascript.
Strike Mozilla Firefox Javascript Engine XML Parser Integer Overflow	CVE: 2006-0297 BID: 16476	This strike exploits a memory corruption vulnerability in Mozilla Firefox that occurs when a large number of elements are fed to the XML parser.
Strike Firefox CSS letter-spacing Property Memory Corruption (Letter Spacing)	CWE: 189 CVE: 2006-1730 BID: 17516	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling HTML which contains a CSS letter-spacing property whose value contains a large number.

Name	References	Description
Strike Firefox Link Tag Code Injection	BID: 13216 CWE: 94 CVE: 2005-1155	This strike exploits a flaw in the Firefox's handling of the link tag that allows arbitrary Javascript to execute with chrome privileges
Strike Firefox resource --Local File Read Variant 1	CVE: 2007-3073	This strike exploits a lack of input validation to read in arbitrary files with Firefox using the 'resource://gre/' protocol handler.
Strike Firefox resource --Local File Read Variant 2	CVE: 2007-3073	This strike exploits a lack of input validation to read in arbitrary files with Firefox using the 'resource://gre/' protocol handler.
Strike Firefox location.hostname Null Byte Vulnerability	BID: 22566 CWE: 264 CVE: 2007-0981	This strike allows access to third-party domain's cookies via a vulnerability in Firefox that allows a site to impersonate an arbitrary domain name
Strike Firefox LookupGetterOrSetter Dangling Pointer	CWE: 119 CVE: 2010-3183 BID: 44249	This strike triggers a vulnerability in Firefox < 3.5.14 and 3.6.x < 3.6.11 that is caused by Firefox not properly supporting calls with no arguments to window.__lookupGetter__. Such calls result in the use of a dangling pointer, which can lead to arbitrary code execution.
Strike Mozilla Firefox LookupUCProperty Memory Corruption	CWE: 119 CVE: 2007-2867 BID: 24242	This strike exploits a bug in Mozilla Firefox when referencing javascript objects whose internal proto attribute has been set to null.
Strike Mozilla Firefox Missing Frame Element Memory Corruption	CWE: 119 CVE: 2007-2867 BID: 24242	This strike exploits a bug in Mozilla Firefox when handling HTML documents with an IFRAME element that is deleted and then readded.
Strike Mozilla Firefox moz-grid Modification Denial of Service	CVE: 2006-1738 BID: 17516	This strike exploits a denial of service vulnerability in Mozilla Firefox when displaying a page that modifies the -moz-grid display style.

Name	References	Description
Strike Firefox 3.6.16 Object mChannel Use After Free	CWE: 399 CVE: 2011-0065	This strike triggers a vulnerability in Firefox 3.6.16 that is caused by the object mChannel getting freed and then subsequently used. Successful exploitation could lead to code execution.
Strike Mozilla Firefox onUnload() Memory Corruption	CVE: 2007-1092 BID: 22679	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling onUnload() events.
Strike Firefox Plugin Finder Javascript Injection Variant 1	BID: 13228 CVE: 2005-0752	This exploits a vulnerability that allows a 'javascript:' URL inside the 'pluginspage' attribute inside the HTML tag of a missing plugin.
Strike Firefox Plugin Finder Javascript Injection Variant 2	BID: 13228 CVE: 2005-0752	This exploits a vulnerability that allows a 'javascript:' URL inside the 'pluginspage' attribute inside the HTML tag of a missing plugin.
Strike Mozilla Firefox QueryInterface() Arbitrary Code Execution (Linux)	BID: 16476 CVE: 2006-0295	This strike exploits a code execution vulnerability in the Mozilla Firefox browser (targeting Linux).
Strike Mozilla Firefox QueryInterface() Arbitrary Code Execution (OS X)	BID: 16476 CVE: 2006-0295	This strike exploits a code execution vulnerability in Mozilla Firefox browser (targeting Mac OS X).
Strike Mozilla Firefox Style Engine Position Change Memory Corruption	CVE: 2006-0294 BID: 16476	This strike exploits a memory corruption vulnerability in Mozilla Firefox that occurs when a style element is changed from position:relative to position:static.
Strike Mozilla Firefox clipPath SVG stroke-width Memory Corruption	CWE: 119 CVE: 2007-0776 BID: 22964	This strike exploits a memory corruption vulnerability in Mozilla Firefox when rendering SVG documents with a large stroke-width xml property.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Firefox SVG Processing Memory Corruption	CWE: 94  CVE: 2006-6504  BID: 21668	This strike exploits a memory corruption vulnerability in Mozilla Firefox when handling SVG documents in which child nodes are moved into the DOM tree using javascript.
Strike Mozilla Firefox SVG pathSegList.getItem Negative Argument Memory Corruption	CWE: 119  CVE: 2007-2867  BID: 24242	This strike exploits a bug in Mozilla Firefox when passing a negative argument to the pathSeglist.getItem() SVG method.
Strike Mozilla Firefox SVGZoom Memory Corruption	CWE: 119  CVE: 2007-2867  BID: 24242	This strike exploits a bug in Mozilla Firefox when changing the scaling factor on an SVG object that has been removed from the document.
Strike Mozilla Firefox TR Element Display=Inherit Memory Corruption	CWE: 119  CVE: 2007-2867  BID: 24242	This strike exploits a bug in Mozilla Firefox when dynamically inserting elements into a table with a TR tag with a crafted style attribute.
Strike Firefox Protocol Handler Code Execution Variant 1	BID: 25053  CVE: 2007-3845	This strike generates an HTML page containing malicious hyperlinks. If Internet Explorer 7 has been installed, these URIs will cause Firefox 2.0.0.5 to execute arbitrary commands
Strike Firefox Protocol Handler Code Execution Variant 2	BID: 25053  CVE: 2007-3845	This strike generates an HTML page containing malicious hyperlinks. If Internet Explorer 7 has been installed, these URIs will cause Firefox 2.0.0.5 to execute arbitrary commands
Strike Firefox Protocol Handler Code Execution Variant 3	BID: 25053  CVE: 2007-3845	This strike generates an HTML page containing malicious hyperlinks. If Internet Explorer 7 has been installed, these URIs will cause Firefox 2.0.0.5 to execute arbitrary commands

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Firefox Protocol Handler Code Execution Variant 4	BID: 25053 CVE: 2007-3845	This strike generates an HTML page containing malicious hyperlinks. If Internet Explorer 7 has been installed, these URIs will cause Firefox 2.0.0.5 to execute arbitrary commands
Strike Firefox URL Spoofing	CWE: 264 CVE: 2010-1206	When a new tab or window is opened in Firefox, the new url is put automatically into the address bar. An attacker can leverage this by opening a new window/tab with a url of his choosing and then calling window.stop(), which stops the new page from loading the content. Since the content from the url was never loaded, the new window document is still the about:blank document, which is considered to have the same origin as the parent window. This means that the parent window can access and manipulate the contents of the child window, which lets an attacker spoof a url of his choice.
Strike Firefox wyciwyg --Cache Manipulation Flaw (Defacing)	CWE: 200 CVE: 2007-3656 BID: 24831	This strike uses a flaw in the wyciwyg:// protocol of Firefox in conjunction with a 302 redirect to display modified cache content for any domain
Strike Firefox wyciwyg --Cache Manipulation Flaw (XSS)	CWE: 200 CVE: 2007-3656 BID: 24831	This strike uses a flaw in the wyciwyg:// protocol of Firefox in conjunction with a 302 redirect to display modified cache content for any domain
Strike Firefox XSLT Memory Corruption PoC	BID: 34235 CWE: 399 CVE: 2009-1169	This strike causes memory corruption in Firefox. This is a slightly different case than the one on Milworm. EIP should be invalid when the bug triggers.
Strike Firefox XSS Code Injection (FFRC)	BID: 13544 CVE: 2005-1477	This strike exploits a flaw in Firefox that results in execution of arbitrary code.
Strike Firefox XSS Code Injection (Generic)	BID: 13544 CVE: 2005-1477	This strike exploits a flaw in Firefox that results in execution of arbitrary code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Mozilla Firefox XUL menupopup.menu Null Pointer Dereference	CVE: 2007-0775 BID: 22694	This strike exploits a null pointer dereference bug in Mozilla Firefox when parsing XUL XML files with a null menupopup.menu.
Strike Mozilla Firefox XUL Tree Node Removal	CVE: 2007-0775 BID: 22964	This strike exploits a memory corruption vulnerability in Mozilla Firefox when rendering XUL documents that programmaticaly modify the subelements of a tree node.
Strike Mozilla Firefox xulCommandDispatcher Deleted Object Memory Corruption	CWE: 119 CVE: 2007-2867 BID: 24242	This strike exploits a bug in Mozilla Firefox when handling XUL documents that reference deleted objects when calling xulCommandDispatcher functions.
Strike Adobe Flash 10 Corrupted SWF File		This strike exploits a flaw in Adobe Flash 10 that causes Internet Explorer 6/7/8 to crash while attempting to load a corrupted .swf file.
Strike Adobe Flash 9-10 ASnative(15,0) NULL Pointer Dereference		This strike exploits a NULL pointer dereference in the Adobe Flash browser plugin. This flaw is triggered when the ASnative method is used to call function 15-0 with a string as the first parameter.
Strike Adobe Flash 9-10 ASnative(301,1) NULL Pointer Dereference		This strike exploits a NULL pointer dereference in the Adobe Flash browser plugin. This flaw is triggered when the ASnative method is used to call function 301-1 with less than two parameters.
Strike Adobe Flash AVM Bytecode Verification Vulnerability	CVE: 2011-0609 BID: 46860	This strike exploits a vulnerability in Adobe Flash Player that can lead to remote code execution.
Strike Adobe Flash Player FLV Long String Buffer Overflow	CWE: 189 CVE: 2007-3456 BID: 24856	This strike exploits a buffer overflow in the Adobe Flash Player.
Strike Adobe Flash MP4 Memory Corruption	CWE: 119 CVE: 2012-0754 BID: 52034	This strike exploits a memory corruption vulnerability in Adobe Flash player, in the way it incorrectly validates the user supplied lengh of an MP4 file.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe Flash 9-10 System.Product.launch() Command Execution	BID: 32896 CWE: 94 CVE: 2008-5499	This strike exploits a command execution flaw in Adobe Flash Player for Linux. Versions of Flash 10 below 10.0.12.36 and Flash 9 below 9.0.151.0 are vulnerable. This flaw can be used to execute system commands as the user running Flash.
Strike Flashchat aedating4CMS.php dir[inc] Parameter PHP File Include Variant 1	CWE: 94 CVE: 2006-4583 BID: 19826	This strike exploits a PHP include flaw in the Flashchat web application.
Strike Flashchat aedating4CMS.php dir[inc] Parameter PHP File Include Variant 2	CWE: 94 CVE: 2006-4583 BID: 19826	This strike exploits a PHP include flaw in the Flashchat web application.
Strike Flashchat aedating4CMS.php dir[inc] Parameter PHP File Include Variant 3	CWE: 94 CVE: 2006-4583 BID: 19826	This strike exploits a PHP include flaw in the Flashchat web application.
Strike FlashGameScript index.php func Parameter PHP File Include	BID: 22646 CWE: 94 CVE: 2007-1078	This strike exploits a PHP include flaw in FlashGameScript, an arcade website script.
Strike FlexBB index.php flexbb_lang_id Cookie SQL Injection	BID: 23161 CVE: 2007-1729	This strike exploits an SQL injection vulnerability in an unchecked cookie value in FlexBB
Strike Microsoft IIS Form_JScript.asp XSS		This strike attempts to access a sample script included with IIS 4.0 that is vulnerable to cross-site scripting (XSS).
Strike Formbook Oct 2021 Campaign - Command and Control		This strike simulates the 'Formbook Oct 2021 Campaign - Formbook Command and Control' traffic that occurs after executing the Formbook malware.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Forum Livre busca2.asp palavra Parameter HTTP Post Cross Site Scripting	CVE: 2007-0589  BID: 22246	This strike exploits a cross site scripting vulnerability in the Forum Livre web application.
Strike Free File Hosting forgot_pass.php AD_BODY TEMP Parameter PHP File Include	BID: 20781  CWE: 94  CVE: 2006-5762	This strike exploits a PHP include flaw in Free File Hosting versions prior to 1.1.
Strike Microsoft FrontPage DOS Device Name Crash Variant 1	BID: 1608  CVE: 2000-0709  CVE: 2000-0710	This strike attempts to crash the remote FrontPage enabled web server by requesting a DOS device name through the SHTML component.
Strike Microsoft FrontPage DOS Device Name Crash Variant 2	BID: 1608  CVE: 2000-0709  CVE: 2000-0710	This strike attempts to crash the remote FrontPage enabled web server by requesting a DOS device name through the SHTML component.
Strike Microsoft FrontPage DOS Device Name Crash Variant 3	BID: 1608  CVE: 2000-0709  CVE: 2000-0710	This strike attempts to crash the remote FrontPage enabled web server by requesting a DOS device name through the SHTML component.
Strike Microsoft FrontPage DOS Device Name Crash Variant 4	BID: 1608  CVE: 2000-0709  CVE: 2000-0710	This strike attempts to crash the remote FrontPage enabled web server by requesting a DOS device name through the SHTML component.
Strike Exodesk PHP Desk faq.php id Parameter SQL Injection (FullAspSite)	CVE: 2007-0678  BID: 22347	This strike exploits a SQL injection vulnerability in the Exodesk PHP Desk web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike GDIPPlus JPEG Processing Buffer Overrun - HTTP File Download	BID: 11173  CVE: 2004-0200	This strike exploits a vulnerability in the processing of JPEG images in multiple Microsoft products based on the GDIPPlus image library. This strike simulates downloading a JPEG via HTTP.
Strike GestArt aide.php3 aide Parameter PHP File Include	BID: 20750  CWE: 94  CVE: 2006-5612	This strike exploits a remote file include vulnerability in GestArt
Strike GitList Unauthenticated Remote Command Execution	EXPLOITDB : 44548	This strike exploits a remote command execution vulnerability in GitList. The vulnerability is due to improper sanitization of user-controlled values passed in search queries. By exploiting this vulnerability, a remote, unauthenticated attacker can execute arbitrary operating system commands on the target server.
Strike Google Chrome v8 Object.seal Map Transitions Type Confusion	GOOGLE: 1923	This strike exploits a vulnerability in Google Chrome. Specifically the vulnerability lies with how the v8 Javascript engine handles Object.seal/freeze on maps and element storage of objects, and how incorrect map transitions are followed by v8 without properly updating the element backing store. This can cause a denial of service condition in the browser but also leads to remote code execution.
Strike Google Chrome Javascript V8 Engine Integer Overflow		There are several integer overflow vulnerabilities in various functions in Google Chrome. One of the ways to access these functions is by concatenating large arrays. By doing this, an attacker can choose the amount by which to overflow an integer, which may lead to a stack overflow and arbitrary code execution.
Strike GrapAgenda index.php page Parameter PHP File Include	CVE: 2006-4610  BID: 19857	This strike exploits a PHP include flaw in GrapAgenda web application.
Strike Hancitor Malware April 2020 Campaign Command and Control Data Exfiltration		This strike simulates the Hancitor Malware April 2020 Campaign Command and Control traffic that occurs after installing the 'VBS' module with the following steps 1. Client sends HTTP GET request - Server replies with the IP address of client 2. Host/OS-Version data is exfiltrated via HTTP GET request - Server replies with the encoding algorithm works like Base64Encode(XOR(URL_List)) that are used for the next phase of the attack where requests are made 3. Client sends HTTP POST request - Server replies with unknown binary data
Strike HP Intelligent Management Center Unauthenticated File Retrieval		This strike exploits a directory traversal vulnerability presents in the HP Intelligent Management Center. The vulnerability is due to insufficient validation of traverse directory requests. The remote attacker may disclosure the information in the target system.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike HP OpenView Network Node Manager AcceptLang Buffer Overflow	CWE: 119 CVE: 2009-0921 BID: 34135	This strike sends a malicious cookie value that will trigger a buffer overflow condition on vulnerable installations of HP OpenView Network Node Manager web application.
Strike HP OpenView Network Node Manager OvOsLocale Buffer Overflow	CWE: 119 CVE: 2009-0920 BID: 34294	This strike sends a malicious cookie value that will trigger a buffer overflow condition on vulnerable installations of HP OpenView Network Node Manager web application.
Strike HP Universal CMDB Server Credential Code Execution		This audit exploits a default credentials vulnerability in HP Universal CMDB server. Attackers can use this vulnerability to bypass the authentication on the target system.
Strike Headline Portal Engine page.newnews.show.php3 HPEinc Parameter PHP File Include	BID: 19663	This strike exploits a PHP include flaw in the Headline Portal Engine web application. An attacker could exploit this vulnerability to execute arbitrary server-side script code.
Strike Headline Portal Engine thememaker.php3 HPEinc Parameter PHP File Include Variant 2	BID: 19663	This strike exploits a PHP include flaw in the Headline Portal Engine web application. An attacker could exploit this vulnerability to execute arbitrary server-side script code.
Strike Microsoft IIS HTR Source Fragment Disclosure	CVE: 2001-0004 BID: 2313	This strike attempts to retrieve the source code of 'global.asa' by exploiting a parsing flaw in the HTR ISAPI filter.
Strike IBiz EBanking Integrator ActiveX WriteOFXDataFile Method Arbitrary File Write	BID: 28700 CVE: 2008-1725	This strike exploits an arbitrary file write bug in the IBiz EBanking ActiveX control when calling the WriteOFXDataFile method.
Strike IBM Lotus Domino HPRAgentName buffer overflow		This strike exploits an IBM Lotus Domino buffer overflow vulnerability. This vulnerability is due to bad input check the boundary of the parameter. Remote attackers may do arbitrary code execution on the target system.

Name	References	Description
Strike IBM Lotus Domino Web Access ActiveX Control Buffer Overflow	CWE: 119 CVE: 2007-4474 BID: 26972	There exists a stack-based buffer overflow in the IBM Lotus Domino Web Access 7.x ActiveX control in dwa7W.dll which potentially allows remote attackers to execute arbitrary code via an overly long string supplied as the parameter ServerName of General_ServerName property which is processed by the affected method InstallBrowserHelperDll() which has improper bounds checking. This strike delivers a payload via an html page that is consistent with triggering the vulnerable conditions of this ActiveX control method buffer overflow flaw.
Strike IBM Lotus Sametime StMux.exe Buffer Overflow	CWE: 119 CVE: 2008-2499 BID: 29328	This strike triggers a stack buffer overflow in IBM Lotus Sametime Server (StMux.exe) by doing a POST request with an overly long path.
Strike IBM WebSphere Application Server Cross-Site Scripting	BID: 34001 CWE: 79 CVE: 2009-0855 CVE: 2009-0856	This strike exploits an XSS attack on an IBM WebSphere Application Server.
Strike IcedID Dec 2020 Campaign - IcedID Loader Command and Control		This strike simulates the 'IcedID Dec 2020 Campaign - IcedID Loader Command and Control' traffic that occurs after executing the IcedID Loader malware.
Strike ICloudCenter ICJobSite 1.1 index.php pid Parameter SQL Injection Vulnerability	CWE: 89 CVE: 2011-1557 BID: 47100	This strike exploits a SQL injection flaw in ICloudCenter's ICJobSite 1.1 web application.
Strike Microsoft IIS IDA Path Disclosure	BID: 1065 CVE: 2000-0071	This strike attempts to discover the physical path of the web root by requesting a non-existent IDA file.
Strike IDAutomation Aztec SaveBarcode ActiveX Arbitrary File Write	BID: 29204 CWE: 20 CVE: 2008-2283	This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike IDAutomation Aztec SaveEnhWMF ActiveX Arbitrary File Write	BID: 29204 CWE: 20 CVE: 2008-2283	This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.
Strike IDAutomation DataMatrix SaveBarcode ActiveX Arbitrary File Write	BID: 29204 CWE: 20 CVE: 2008-2283	This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.
Strike IDAutomation DataMatrix SaveEnhWMF ActiveX Arbitrary File Write	BID: 29204 CWE: 20 CVE: 2008-2283	This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.
Strike IDAutomation Linear SaveBarcode ActiveX Arbitrary File Write	BID: 29204 CWE: 20 CVE: 2008-2283	This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.
Strike IDAutomation Linear SaveEnhWMF ActiveX Arbitrary File Write	BID: 29204 CWE: 20 CVE: 2008-2283	This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.
Strike IDAutomation PDF SaveBarcode ActiveX Arbitrary File Write		This strike exploits an arbitrary file write vulnerability in the IDAutomation Aztec ActiveX control.
Strike Microsoft IIS IDQ Path Disclosure	BID: 1065 CVE: 2000-0071	This strike attempts to discover the physical path of the web root by requesting a non-existent IDQ file.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike MSIE7 ActiveX Control BrowseDialog Denial of Service	BID: 22110 CVE: 2007-0371	This strike causes a denial of service in Microsoft Internet Explorer 7 by exploiting a bug in the 'BrowseDialog' ActiveX control.
Strike IE8 CSS Import Remote Code Execution Vulnerability	CWE: 399 CVE: 2010-3971 BID: 45246	This strike exploits a vulnerability in Internet Explorer 8's handling of various @import css declarations.
Strike Microsoft Internet Explorer VML Use After Free CVE 2012-0172	CWE: 94 CVE: 2012-0172	This strike exploits a user after free vulnerability in Microsoft Internet Explorer. This can be seen when VML is used in an HTML body element and script code is used in the style attribute of the body element to clear the document. A use after free condition is observed if the elements are cleared or destroyed and referenced later.
Strike Microsoft Internet Explorer Uninitialized Object Memory Corruption	CWE: 20 CVE: 2011-1995	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. It is due to uninitialized object(ActiveX controls)access where arbitrary attributes can be set, and then along with their child attributes can be accessed. This can possibly allow remote code execution as well as cause a termination of the application.
Strike Internet Explorer ADODB.Recordset.Filter DoS	BID: 18773 CVE: 2006-3354	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the ADODB.Recordset COM object.
Strike Internet Explorer Applet File Path DoS	BID: 15208	This strike exploits a denial of service flaw in the Internet Explorer web browser.
Strike Internet Explorer NMSAASFSourceMediaDescription.value DoS	BID: 19114 CVE: 2006-3897	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the NMSAASFSourceMediaDescription COM object.
Strike Internet Explorer AxDebugger.Document DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the AxDebugger.Document COM object.
Strike Internet Explorer 7.0 Beta 2 BG SOUND DoS	CVE: 2006-0544 BID: 22621	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the BG SOUND element with a long local file name specified as the source.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike CapiCom.Utilities ActiveX GetRandom Integer Overflow Denial of Service		This strike causes a denial of service in Microsoft's CapiCom.Utilities ActiveX Control by exploiting an integer overflow in the 'GetRandom' function.
Strike Microsoft Internet Explorer circular reference	CWE: 399 CVE: 2009-3674	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. It exists due to improper handling of script-modified DOM structures when an HTML document is being parsed. When a circular reference between two DOM objects is created, it is not validated after the objects are later removed from the main markup.
Strike Internet Explorer Comctl32.dll Heap Overflow	CWE: 119 CVE: 2010-2746 BID: 43717	This strike exploits a vulnerability in comctl32.dll by delivering an invalid svg to the victim.
Strike Internet Explorer createTextRange() Code Execution Variant 1	BID: 17196 CWE: 94 CVE: 2006-1359	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer createTextRange() Code Execution Variant 2	BID: 17196 CWE: 94 CVE: 2006-1359	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer createTextRange() Code Execution Variant 3	BID: 17196 CWE: 94 CVE: 2006-1359	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer createTextRange() Code Execution Variant 4	BID: 17196 CWE: 94 CVE: 2006-1359	This strike exploits a code execution vulnerability in Internet Explorer.

Name	References	Description
Strike Internet Explorer createTextRange() Code Execution Variant 5	BID: 17196  CWE: 94  CVE: 2006-1359	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer createTextRange() Code Execution Variant 6	BID: 17196  CWE: 94  CVE: 2006-1359	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Microsoft IE CSS Memory Corruption	CVE: 2004-0842  BID: 10816	This strike exploits a vulnerability in Internet Explorer that causes a heap overflow due to an unterminated multi-line comment in a style tag.
Strike Internet Explorer DirectAnimation.DA UserData.Data DoS	BID: 18902  CVE: 2006-3513	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the DirectAnimation.DAUserData COM object.
Strike Internet Explorer DirectAnimation.StructuredGraphicsControl.SourceURL DoS	BID: 18855  CVE: 2006-3427	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the DirectAnimation.StructuredGraphicsControl COM object.
Strike Microsoft Internet Explorer use after free Null reference	CWE: 20  CVE: 2011-1997  BID: 49962	This strike exploits a user after free vulnerability in Microsoft Internet Explorer. When an attributes element is set to Null and cleared by the GarbageCollector, it can still be referenced later allowing for the corruption of memory.
Strike Internet Explorer File Upload Keystroke Hijack	CWE: 200  CVE: 2006-2900  BID: 18308	This strike exploits a user interface misdirection vulnerability in Microsoft Internet Explorer. Due to lax control of the input text field for the file upload widget, a malicious website may redirect keystrokes intended for one element of a frame to the file upload widget. This technique can be used to cause a victim to unknowingly upload a local file to the remote web site.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer FTP Web View XSS	CVE: 2002-2062 BID: 4954	This strike exploits a cross site scripting vulnerability in Microsoft Internet Explorer when Internet Explorer is configured to enable folder view for web sites and allows web content in folders.
Strike Internet Explorer HtmlDlgSafeHelper.HtmlDlgSafeHelper.BlockFormats DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the HtmlDlgSafeHelper.HtmlDlgSafeHelper COM object.
Strike Internet Explorer iepeers.dll Use-After-Free Vulnerability	CWE: 399 CVE: 2010-0806 BID: 38615	This strike exploits a use after free vulnerability that is present inside Microsoft IE, which gets triggered through actions that are taken by an embedded object. Remote attacker can use this vulnerability to do code execution on the target system.
Strike Internet Explorer IFRAME Overflow	CVE: 2004-1050 BID: 11515	This strike exploits a buffer overflow flaw in the handling of IFRAME NAME properties in Microsoft Internet Explorer.
Strike Internet Explorer Internet.PopupMenu .RemoveItem DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the Internet.PopupMenu COM object.
Strike Microsoft Internet Explorer Javascript For Loop Denial of Service	CVE: 2007-0811 BID: 22408	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when processing Javascript for-loops.
Strike IE Long Hostname Memory Corruption	CVE: 2005-0554 BID: 13123	This strike exploits a denial of service flaw in Microsoft Internet Explorer when handling long hostnames.
Strike Internet Explorer mdsauth.dll Arbitrary File Overwrite	CVE: 2007-2221 BID: 23827	This strike exploits an arbitrary remote file overwrite bug in Internet Explorer when browsing a page that contains a vulnerable COM object.
Strike Internet Explorer Microsoft.ISCatAdm DoS	CVE: 2006-4495 BID: 19636	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the Microsoft.ISCatAdm COM object.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer Mouse Drag Hijack	CVE: 2004-0841 BID: 10690	This strike exploits a flaw in Internet Explorer that allows Javascript calls to hijack mouse events.
Strike Internet Explorer JPEG Processing DoS (CMP)	CVE: 2005-2308 BID: 14284	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through a malformed JPEG image.
Strike Internet Explorer JPEG Processing DoS (MOV)	BID: 14282 CVE: 2005-2308	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through a malformed JPEG image.
Strike Internet Explorer JPEG Processing DoS (OOM)	BID: 14285 CVE: 2005-2308	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through a malformed JPEG image.
Strike Internet Explorer EMF File Rendering Denial of Service (HTTP)	CWE: 399 CVE: 2005-0803 BID: 12834	This strike exploits a denial of service flaw in Microsoft Windows. This flaw is triggered through a malformed Windows EMF Metafile. This strike simulates downloading an EMF file via HTTP.
Strike Internet Explorer WMF File Rendering Denial of Service (HTTP)	CVE: 2005-2124 BID: 15356	This strike exploits a denial of service flaw in Microsoft Windows. This flaw is triggered through a malformed Windows WMF Metafile. This strike simulates downloading an WMF file via HTTP.
Strike Microsoft Internet Explorer Corrupted True Type Font	CVE: 2011-3402 BID: 50462	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when using a corrupted true type font. duku uses this for its attack.
Strike Microsoft Internet Explorer Time Behavior Use After Free	CWE: 94 CVE: 2011-3397 BID: 50970	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when using the deprecated time behavior.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer winhlp32.exe MsgBox() Remote Code Execution Vulnerability	CWE: 94 CVE: 2010-0483 BID: 38463	This strike exploits the way VBScript interacts with Windows Help files when using Internet Explorer. If an attacker can trick the user into pressing F1 after a dialog is displayed, he/she can run arbitrary code on the user's machine.
Strike Internet Explorer MSHTML Parsing DoS	BID: 16079	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through a specific malformed block of HTML code.
Strike Internet Explorer NMSA.MediaDescription.dispvalue DoS	BID: 19114 CVE: 2006-3897	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the NMSA.MediaDescription COM object.
Strike Microsoft Internet Explorer Temporary Internet Files Folder Access	CVE: 2002-1188 BID: 6217	This strike exploits an vulnerability in Microsoft Internet Explorer that allows temporary internet files to be referenced in the local zone.
Strike Microsoft Internet Explorer use-after-free onreadystatechange	CWE: 399 CVE: 2010-0491 BID: 39027	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer. It exists due to a use-after-free error when parsing HTML with the onreadystatechange event.
Strike Use After Free CMarkup Vulnerability in Microsoft Internet Explorer	CWE: 119 CVE: 2014-4085 BID: 69589	This strike exploits a use after free vulnerability inside Microsoft Internet Explorer. This vulnerability is due to an error that occurs when handling CMarkup objects. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Microsoft Internet Explorer Option Element Memory Corruption	CWE: 20 CVE: 2011-1996 BID: 49961	This strike exploits the way Microsoft Internet Explorer handles the Option Element within an Option cache. Using the innerHTML and innerText properties will delete the DOM subtree w/o rebuilding the Options cache. If they are reset pre-existing options will be referenced even after deleted.
Strike Internet Explorer OutlookExpress.AddressBook DoS	CWE: 119 CVE: 2005-4840	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the OutlookExpress.AddressBook COM object.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer Outlook Express Address Book ActiveX DoS	CWE: 119 CVE: 2005-4840	This strike exploits crashes Internet Explorer by loading the Outlook Express address book as an ActiveX object
Strike Microsoft Internet Explorer Print Table of Links Local Zone XSS		This strike exploits a local-zone cross-site scripting vulnerability in Microsoft Internet Explorer when using the "print table of links" functionality.
Strike Internet Explorer RDS.DataControl.URL DoS	BID: 18900 CVE: 2006-3510	This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the RDS.DataControl COM object.
Strike Remote Desktop Connection ActiveX Control Heap Overflow Vulnerability	CWE: 119 CVE: 2009-1929 BID: 35973	This strike exploits a vulnerability in the way the Remote Desktop ActiveX Control validates input from functions available for scripting, resulting in a heap overflow and possibly arbitrary code execution.
Strike Microsoft Internet Explorer Select Element Memory Corruption	CWE: 20 CVE: 2011-1999 BID: 49964	This strike exploits the way Microsoft Internet Explorer handles the Select Element. If a OBefore parameter in the add method is negative, it doesn't validate the number, and instead uses it directly as an index.
Strike Internet Explorer Sysmon DoS		This strike exploits a denial of service flaw in the Internet Explorer web browser. This flaw is triggered through the Sysmon COM object.
Strike Internet Explorer TSUserEX.DLL ActiveX	CVE: 2006-4219 BID: 19570	This strike instantiates TSUserEX.DLL which causes IE 6 SP1 on Windows 2003 Server CN to crash.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 1	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 2	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 3	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 4	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 5	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 6	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 7	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 8	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer VML Fill Method Buffer Overflow Variant 9	CWE: 119 CVE: 2006-4868 BID: 20096	This strike exploits a code execution vulnerability in Internet Explorer.
Strike Microsoft Windows WinHlp Item Buffer Overflow	CVE: 2002-0823 BID: 4857	This strike exploits Microsoft Internet Explorer using a buffer overflow vulnerability in the WinHlp ActiveX control.
Strike Internet Explorer WMF CreateBrushIndirect () DoS	CVE: 2006-4071 BID: 19365	This strike exploits a denial of service flaw in the GDI32 CreateBrushIndirect() function using Internet Explorer and the WMF file format.
Strike Internet Explorer 8 CSS import toStaticHTML XSS filter bypass	CWE: 79 CVE: 2010-3324 BID: 42467	This strike bypasses the anti-XSS functionality of the toStaticMethod in Internet Explorer 8.
Strike Ignite Realtime Openfire Server Cross-Site Scripting (XSS)		This strike exploits a cross-site scripting vulnerability in Ignite Realtime Openfire Server. The vulnerability is due to improper validation of HTTP request hostname parameter. By exploiting this vulnerability an attacker could execute arbitrary scripts on the target machine.
Strike Microsoft IIS 5.1 Alternate Data Stream Authentication Bypass	BID: 41314 CWE: 287 CVE: 2010-2731	This strike exploits a vulnerability in Microsoft IIS 5.1 that allows a user to bypass directory access restrictions. If a user appends "::\$i30:\$INDEX_ALLOCATION" to the directory name in a url, he is granted access.
Strike Microsoft IIS idq.dll IDA-IDQ ISAPI Overflow Variant 1	CVE: 2001-0500 BID: 2880	This strike exploits a buffer overflow vulnerability in Microsoft IIS idq.dll.
Strike Microsoft IIS idq.dll IDA-IDQ ISAPI Overflow Variant 2	CVE: 2001-0500 BID: 2880	This strike exploits a buffer overflow vulnerability in Microsoft IIS idq.dll.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike IIS Long URL QoS Denial of Service	CWE: 399 CVE: 2011-1965 BID: 48990	This strike exploits a denial of service bug in the URL based QoS processing of a long URI in the IIS Web Server.
Strike iLife Photocast XML Title Format String Variant 1	CWE: 134 CVE: 2007-0051 BID: 21871	This strike exploits a format string vulnerability in Apple iLife. The flaw lies in the parsing of the title field of an iPhoto RSS feed. By convincing a user to subscribe to a malicious RSS Feed, an attacker could remotely execute arbitrary code. This strike emulates the original PoC.
Strike InterAKT Online MX Shop index.php idp Parameter SQL Injection	BID: 14876 CVE: 2005-3004	This strike exploits a SQL injection vulnerability in InterAKT Online MX Shop
Strike InterAKT Online MX Shop index.php id_ctg Parameter SQL Injection	BID: 14876 CVE: 2005-3004	This strike exploits a SQL injection vulnerability in InterAKT Online MX Shop
Strike InterAKT Online MX Shop index.php id_prd Parameter SQL Injection	BID: 14876 CVE: 2005-3004	This strike exploits a SQL injection vulnerability in InterAKT Online MX Shop
Strike inTouch index.php user Parameter SQL Injection	CVE: 2006-0088 BID: 16110	This strike exploits a SQL injection flaw in the inTouch Web Application.
Strike Invisionix Roaming System pageheaderdefault.inc.php _sysSessionPath Parameter PHP File Include	CVE: 2006-4237 BID: 19567	This strike exploits a PHP remote file include flaw in Invisionix Roaming System Remote.
Strike IPSwitch WhatsUp Gold maincfgret.cgi instancename Parameter Buffer Overflow	CVE: 2004-0798 BID: 11043	This strike exploits a buffer overflow in a CGI executable from the IPSwitch WhatsUp Gold network monitoring tool

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft IIS .htn ISAPI Chunked Encoding Overflow	CVE: 2002-0364  BID: 4855	This strike exploits a heap overflow in the HTR ISAPI filter of Microsoft IIS versions 4.0 and 5.0.
Strike Microsoft IIS 5.0 ISAPI .printer Extension Host Header Overflow Variant 2	CVE: 2001-0241  BID: 2674	This strike exploits a buffer overflow in the .printer ISAPI extension for Microsoft IIS 5.0 when handling long Host HTTP headers.
Strike ITunes ITMS Url Parsing Buffer Overflow	CWE: 119  CVE: 2009-0950  BID: 35157	This strike exploits a vulnerability in iTunes 8.1.x itms url parsing
Strike ITunes ITPC Url Parsing Buffer Overflow	CWE: 119  CVE: 2009-0950  BID: 35157	This strike exploits a vulnerability in iTunes 8.1.x itpc url parsing
Strike Oracle Java FileDialog.Show Heap Buffer Overflow	CVE: 2011-0802  BID: 48149	This strike triggers a heap-based buffer overflow in Oracle's Java interpreter by passing an overly long string to the FileDialog::setFile function.
Strike JBoss Application Server Java Unserialization	BID: 77539  CWE: 77  CVE: 2015-4852	This strike exploits a Java Unserialization vulnerability in JBoss application server. The vulnerability is due to unsafe unserialization of java objects, including from untrusted sources By enticing a user to visit a malicious web page, arbitrary command can be executed on the client system.
Strike Joomla! Component EkRishta 2.10 - username SQL Injection	EXPLOITDB : 44877	This strike exploits an Error-Based SQL injection vulnerability in Joomla! Component EkRishta 2.10. The vulnerability is caused by insufficient validation of user input on HTTP requests which are used to create SQL queries. Successful exploitation could allow an attacker to see the database information on the target server.
Strike Joomla 1.7.0 Request URI index.php XSS	CWE: 79  CVE: 2011-2710	This strike exploits a cross site scripting flaw in the Request URI method of the Joomla Content Management System.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Joomla Webring Component admin.webring.docs.php component_dir Parameter PHP File Include	CVE: 2006-4129 BID: 19492	This strike exploits a PHP include flaw in Joomla Content Management Application.
Strike Knusperleicht Shoutbox index.php sb_include_path Parameter PHP File Include	CVE: 2006-3989 BID: 19273	This strike exploits a PHP include flaw in the Knusperleicht Shoutbox web application.
Strike Konqueror FTP IFrame Null Pointer Dereference	CWE: 399 CVE: 2007-1308 BID: 22814	This strike causes a denial of service in Konqueror by accessing properties of an iframe with an FTP type src attribute
Strike Lazarus Jan 2022 Campaign - Malicious-Module Command and Control		This strike simulates the Command and Control traffic that occurs after executing the DLL embedded Malicious-Module.
Strike LBlog comments.asp id Parameter SQL Injection	CVE: 2006-4284 BID: 19607	This strike exploits a SQL injection flaw in the LBlog blogging web application to disclose information from the underlying database.
Strike libpng png_handle_sBIT() Local Overflow (HTTP)	BID: 10857 BID: 15495 CVE: 2004-0597	This strike exploits a vulnerability in the processing of PNG images by libpng. This strike simulates downloading a PNG via HTTP.
Strike phpBook index.php date Parameter PHP Code Execution	CVE: 2006-0206 BID: 16229	This strike exploits an arbitrary code execution flaw in the LightWeight Calendar web application.
Strike Linksys E Series ttcp_ip Remote Code Execution	EXPLOITDB : 31683	This strike exploits a remote code execution vulnerability on Linksys E Series Router. This vulnerability is due to improper handling of the parameter under "ttcp_ip" under http request. A remote unauthenticated attacker can exploit this vulnerability by sending crafted http requests to the target server. Successful exploitation results in remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Linksys WRH54G HTTP Management Interface DoS	CWE: 20 CVE: 2008-2636	The HTTP management interface of the Linksys WRH54G wireless router is vulnerable to a DoS attack when it receives a maliciously crafted url.
Strike Liquid XML Studio 2010 OpenFile() ActiveX Buffer Overflow		This strike exploits a buffer overflow vulnerability present in the OpenFile() method of the LtXmlComHelp8.dll ActiveX control included with Liquid XML Studio 2010.
Strike Liquid XML studio ActiveX openfile BO		This strike exploits buffer overflow vulnerability within a Liquid XML studio ActiveX. This vulnerability is due to lack of confirmation of filename length when handling the openfile function. Remote unauthenticated attackers could exploit this vulnerability to execute arbitrary code on the target system
Strike Lizard Cart CMS pages.php id Parameter SQL Injection	CVE: 2006-0087 BID: 16140	This strike exploits a SQL injection flaw in the Lizard Cart CMS web application.
Strike Lizard Cart CMS detail.php id Parameter SQL Injection	CVE: 2006-0087 BID: 16140	This strike exploits a SQL injection flaw in the Lizard Cart CMS web application.
Strike Microsoft Windows LoadImage API Overflow (HTTP)	BID: 12095 CVE: 2004-1049	This strike exploits a flaw in the parsing of images via LoadImage on Microsoft Windows. This strike simulates downloading a malicious .ani animated cursor from a web server.
Strike IBM Lotus Domino HTTP Header Accept-Language Buffer Overflow	CWE: 119 CVE: 2008-2240 BID: 29310	This strike exploits a buffer overflow flaw in the IBM Lotus Domino web server. If a specially formatted URI is requested in combination with an overly long Accept-Language value, the flaw will be triggered, possibly allowing an attacker to execute arbitrary code.
Strike IBM Lotus Domino HTTP Redirect Buffer Overflow	CVE: 2003-0178 BID: 6870	This strike exploits a buffer overflow flaw in the IBM Lotus Domino web server.
Strike IBM Lotus Domino Web Server Denial of Service	CVE: 2005-0986	This strike exploits a flaw in the IBM Lotus Domino web server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike IBM Lotus iNotes Buffer Overflow Vulnerability	CVE: 2003-0178 BID: 6871	This strike exploits a buffer overflow flaw in the IBM Lotus iNotes web server.
Strike Macromedia Coldfusion Remote SYSTEM Buffer Overflow (Filename)	CVE: 2002-1992 BID: 5121	This strike exploits a remote buffer overflow in the Macromedia Coldfusion 6.0 IIS ISAPI handler.
Strike Macromedia Shockwave swdir.dll ActiveX Control Remote Stack Overflow (Autostart)	CVE: 2007-1403 BID: 22842	This strike exploits a stack overflow in an ActiveX control in Macromedia Shockwave 10.1.4.20's swdir.dll to cause arbitrary code execution.
Strike Macromedia Shockwave swdir.dll ActiveX Control Remote Stack Overflow (BGColor)	CVE: 2007-1403 BID: 22842	This strike exploits a stack overflow in an ActiveX control in Macromedia Shockwave 10.1.4.20's swdir.dll to cause arbitrary code execution.
Strike Macromedia Shockwave swdir.dll ActiveX Control Remote Stack Overflow (Drawlogo)	CVE: 2007-1403 BID: 22842	This strike exploits a stack overflow in an ActiveX control in Macromedia Shockwave 10.1.4.20's swdir.dll to cause arbitrary code execution.
Strike Macromedia Shockwave swdir.dll ActiveX Control Remote Stack Overflow (Drawprogress)	CVE: 2007-1403 BID: 22842	This strike exploits a stack overflow in an ActiveX control in Macromedia Shockwave 10.1.4.20's swdir.dll to cause arbitrary code execution.
Strike Macromedia Shockwave swdir.dll ActiveX Control Remote Stack Overflow (Sound)	CVE: 2007-1403 BID: 22842	This strike exploits a stack overflow in an ActiveX control in Macromedia Shockwave 10.1.4.20's swdir.dll to cause arbitrary code execution.
Strike Macromedia Shockwave swdir.dll ActiveX Control Remote Stack Overflow (SRC)	CVE: 2007-1403 BID: 22842	This strike exploits a stack overflow in an ActiveX control in Macromedia Shockwave 10.1.4.20's swdir.dll to cause arbitrary code execution.
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (Autostart)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (Bgcolor)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (DrawLogo)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (DrawProgress)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (Sound)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (SRC)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.
Strike Macromedia Shockwave SWDIR.SLL ActiveX Denial of Service (SWURL)	CVE: 2006-6885 BID: 22067	This strike exploits a Shockwave ActiveX plugin that is vulnerable to a denial of service.
Strike MagnetoSoft DNS DNSLookupHostWithServer ActiveX Control Format String		This module exploits a format string flaw in the MagnetoSoft DNS DNSLookupHostWithServer ActiveX Control.
Strike MagnetoSoft ICMP AddDestinationEntry ActiveX Control Buffer Overflow		This module exploits a buffer overflow in the MagnetoSoft ICMP AddDestinationEntry ActiveX Control.
Strike MagnetoSoft NetResources NetConnectionEnum ActiveX Control Buffer Overflow		This module exploits a buffer overflow in the MagnetoSoft NetResources NetConnectionEnum ActiveX Control.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike MagnetoSoft NetResources NetSessionDel ActiveX Control Buffer Overflow		This module exploits a buffer overflow in the MagnetoSoft NetResources NetSessionDel ActiveX Control.
Strike MagnetoSoft SNTP SntpGetReply ActiveX Control Buffer Overflow		This module exploits a buffer overflow in the MagnetoSoft SNTP SntpGetReply ActiveX Control.
Strike Operation Quicksand Nov 2020 Campaign - Powershell Malware File Transfer	MD5: 2e7b4ae4b aa70458824 8b425b8e02 7bf  SHA1: 60b5b41bd5 98fd844630 fdf609539fc 854437392  SHA256: 8bbcd7013 e339cca41c f85a0788ef0 fc250b5451 5a038eff6d4 838a16be04 7d7	This strike simulates the download of the Powershell malware via an HTTP GET request.
Strike Mambo Gallery Manager help.mgm.php mosConfig_absolute_path Parameter PHP File Include	CWE: 94  CVE: 2006-3980  BID: 19224	This strike exploits a PHP include flaw in the Mambo Gallery Manager web application.
Strike Mambo VideoDB Component Module videodb.class.xml.php mosConfig_absolute_path Parameter PHP File Include	CVE: 2006-3736  BID: 19049	This strike exploits a PHP include flaw in the VideoDB component of the Mambo web application.
Strike Matanbuchus Jun 2022 Campaign - Cobalt Strike Beacons		This strike simulates the 'Matanbuchus Jun 2022 Campaign - Cobalt Strike Beacons' traffic that occurs once the Matanbuchus command and control traffic has been sent. This strike sends 2 HTTP GET requests to the command and control server to download Cobalt Strike beacons. The first request downloads a hexadecimal binary that gets converted to ASCII characters, and the second request downloads a dll.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike McAfee EPolicy Orchestrator Source Header Overflow	BID: 20288 CVE: 2006-5156	This strike exploits buffer overflow in the EPolicy Orchestrator HTTP service.
Strike McAfee Subscription Manager ActiveX vsprintf	BID: 19265 CWE: 119 CVE: 2006-3961	This strike exploits a printf-style flaw in the McAfee Subscription Manager ActiveX control
Strike Trojan.MDropper Word Document (http) Variant 1	BID: 18037 CVE: 2006-2492	The Trojan.MDropper malware abuses an arbitrary code execution flaw in Microsoft Office.
Strike Trojan.MDropper Word Document (http) Variant 2	BID: 18037 CVE: 2006-2492	The Trojan.MDropper malware abuses an arbitrary code execution flaw in Microsoft Office.
Strike ME Download System header.php Vb8878b936c2bd8a e0cab Parameter PHP File Include	CVE: 2006-4053 BID: 19336	This strike exploits a PHP include flaw in the ME Download System web application.
Strike MediaWiki index.php rs Cross-Site Scripting	BID: 21956 CVE: 2007-0177	This strike exploits a cross-site scripting vulnerability in the experimental AJAX functionality of MediaWiki
Strike MF Piadas admin.php page Parameter PHP File Include	CVE: 2006-3323 BID: 18679	This strike exploits a PHP include flaw in the MF Piadas web application.
Strike Microsoft Visual FoxPro 6 fpole.ocx FoxDoCmd ActiveX Command Execution	BID: 25977 CWE: 78 CVE: 2007-5322	This strike exploits an input sanitization flaw in Microsoft Visual FoxPro 6 that allows arbitrary commands to be executed by the FoxDoCmd method of the fpole.ocx ActiveX control.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Works wkimgsrc.dll WksPictureInterface Memory Corruption	CWE: 20 CVE: 2008-1898 BID: 28820	This strike exploits a memory corruption vulnerability in the Microsoft Works wkimgsrc.dll Activex component.
Strike MiniBB Forum index.php absolute_path Parameter PHP File Include Variant 1	CVE: 2006-3690 BID: 18998	This strike exploits a PHP include flaw in the MiniBB Forum web application.
Strike MiniBB Forum index.php absolute_path Parameter PHP File Include Variant 2	CVE: 2006-3690 BID: 18998	This strike exploits a PHP include flaw in the MiniBB Forum web application.
Strike Modernbill config.php DIR Parameter PHP File Include	CVE: 2006-4034 BID: 19335	This strike exploits a PHP include flaw in the Modernbill web application.
Strike Mozilla compareTo() Arbitrary Code Execution	BID: 14242 CVE: 2005-2265	This strike exploits a code execution vulnerability in the Mozilla Suite, Mozilla Firefox, and Mozilla Thunderbird applications.
Strike Mozilla File Upload Keystroke Hijack	CWE: 200 CVE: 2006-2900 BID: 18308	This strike exploits a user interface misdirection vulnerability in Mozilla browsers (such as Firefox). Due to lax control of the input text field for the file upload widget, a malicious website may redirect keystrokes intended for one element of a frame to the file upload widget. This technique can be used to cause a victim to unknowingly upload a local file to the remote web site.
Strike Mozilla Window Navigator Object Arbitrary Code Execution	BID: 19181 BID: 19192 CWE: 16 CVE: 2006-3677	This strike exploits a code execution vulnerability in the Mozilla Suite, Mozilla Firefox, and Mozilla Thunderbird applications' "navigator" object.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (showModalDialog)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions.
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (external)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (createRange)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (elementFromPoint)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (getElementById)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (getElementsByTagName)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (getElementsByName)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (getElementsByTagName)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (execCommand)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions
Strike Internet Explorer Cached Objects Zone JavaScript Bypass (clipboardData)	CVE: 2002-1254 BID: 6028	This strike exploits a flaw in Internet Explorer that allows a script to cache objects and use them to bypass zone restrictions

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer Href URL-Encoded Characters Vulnerability	CVE: 2002-1186 BID: 5610	This vulnerability leads to an information disclosure by exploiting a flaw in the way Internet Explorer handles URI encoding
Strike Microsoft Windows Media Services Logging ISAPI Buffer Overflow (121)	CVE: 2003-0227 BID: 7727	This strike exploits a stack-based buffer overflow in Microsoft Windows Media Services via a 121 byte POST to nsiislog.dll which results in remote code execution.
Strike Microsoft Windows Media Services Logging ISAPI Buffer Overflow (5000)	CVE: 2003-0227 BID: 7727	This strike exploits a stack-based buffer overflow in Microsoft Windows Media Services via a 5000 byte POST to nsiislog.dll which results in remote code execution.
Strike Microsoft Windows Media Services Logging ISAPI Buffer Overflow (510)	CVE: 2003-0227 BID: 7727	This strike exploits a stack-based buffer overflow in Microsoft Windows Media Services via a 510 byte POST to nsiislog.dll which results in remote code execution.
Strike Internet Explorer Mishandled OBJECT Tag Type Attribute	CVE: 2003-0344 BID: 7806	This strike exploits a flaw in Internet Explorer's handing of 'type' attributes in 'object' tags
Strike Microsoft IIS nsiilog.dll ISAPI Overflow (25000)	CVE: 2003-0349 BID: 8035	This strike exploits a flaw in nsiislog.dll, an IIS ISAPI filter, by sending a 25000 byte POST request.
Strike Microsoft IIS nsiilog.dll ISAPI Overflow (4354)	CVE: 2003-0349 BID: 8035	This strike exploits a flaw in nsiislog.dll, an IIS ISAPI filter, by sending a 4354 byte POST request.
Strike Microsoft IIS nsiilog.dll ISAPI Overflow (5000)	CVE: 2003-0349 BID: 8035	This strike exploits a flaw in nsiislog.dll, an IIS ISAPI filter, by sending a 5000 byte POST request.
Strike Microsoft Internet Explorer ActiveX Popup Arbitrary Command Execution	CVE: 2003-0838 BID: 8556	This strike exploits a flaw in Microsoft Internet Explorer when displaying web pages that contain malicious popup windows.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer JavaScript XML Object Type Validation Vulnerability	CVE: 2003-0809 BID: 8565	This strike exploits a flaw in internet explorer that loads a malicious URI in the context of the local zone
Strike Microsoft Windows 2000 Troubleshooter JavaScript ActiveX Control Buffer Overflow	CWE: 119 CVE: 2003-0662 BID: 8833	This strike exploits a buffer overflow flaw in the Troubleshooter ActiveX control that is included with Microsoft Windows 2000
Strike IIS Frontpage Extensions Debug Overflow	CVE: 2003-0822 BID: 9007	This strike exploits a buffer overflow in the Frontpage extensions included with IIS.
Strike Help and Support Center Remote Code Execution	CVE: 2004-0199 BID: 10321	This strike generates an HTML page containing a malicious IFRAAME. A browser which processes this IFRAAME will make a Help and Support Center (HCP) request to the local system's HCP DVDUpgrade utility which will then download the requested executable and run it.
Strike Microsoft Windows Compressed Folder Exploit Download (HTTP)	CVE: 2004-0575	This strike exploits a vulnerability in Microsoft Windows when opening a zip file containing a file with a long filename. This strike simulates downloading a malicious zip file via HTTP.
Strike Microsoft Internet Explorer Drag and Drop System File Creation	CVE: 2004-0839 BID: 10973	This strike exploits a vulnerability in Microsoft Internet Explorer that allows a malicious page to write an arbitrary file to the victim host.
Strike Microsoft Internet Explorer Install Engine SetCifFile Heap Overflow	CVE: 2004-0216 BID: 11366	This strike exploits a heap buffer overflow in the Microsoft Internet Explorer Install Engine ActiveX control.
Strike Internet Explorer JavaScript DHTML Object Memory Corruption	CVE: 2005-0553 BID: 13120	This strike exploits a memory corruption flaw in certain DHTML functions in Microsoft Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer 6 PNG tRNS Chunk Buffer Overflow	CVE: 2005-1211 BID: 13941	This strike exploits a buffer overflow vulnerability in pngfilt.dll for IE6 on WinXP SP2. The buffer overflow occurs while processing the tRNS chunk. Usually, a tRNS chunk must have the same number of entries as the PLTE chunk. If the tRNS chunk has more entries than the PLTE chunk, a buffer may be overflowed, possibly leading to arbitrary code execution.
Strike Microsoft IE javaprx.dll COM instantiation heap overflow	CWE: 399 CVE: 2005-2087 BID: 14087	This strike exploits a heap overflow in Microsoft IE 6, which is triggered when a web page instantiates the javaprx.dll as a COM object
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 1	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 4	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 6	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 10	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 11	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 13	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 14	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 18	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 19	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 23	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 25	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 28	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 34	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.
Strike Microsoft IE COM Object Embedded CLSID Arbitrary Code Execution Variant 38	BID: 14511 CVE: 2005-1990	This strike exploits a flaw in Microsoft Internet Explorer that allows for arbitrary code execution when IE instantiates a COM component as an ActiveX control.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Media Player Plugin Filename Buffer Overflow	CWE: 119  CVE: 2006-0005  BID: 16644	This strike exploits a buffer overflow vulnerability in the Windows Media Player web browser plugin.
Strike Microsoft Internet Explorer Multiple Event Handler Buffer Overflow	CVE: 2006-1245  BID: 17131	This strike exploits a buffer overflow vulnerability in Microsoft Internet Explorer when rendering an HTML element with many event handlers.
Strike Microsoft Internet Explorer HTML Tag Parsing Memory Corruption Variant 1	CVE: 2006-1188  BID: 17468	This strike exploits a vulnerability in Microsoft Internet Explorer when parsing HTML tags.
Strike Microsoft Internet Explorer HTML Tag Parsing Memory Corruption Variant 2	CVE: 2006-1188  BID: 17468	This strike exploits a vulnerability in Microsoft Internet Explorer when parsing HTML tags.
Strike Microsoft Internet Explorer HTML Tag Parsing Memory Corruption Variant 3	CVE: 2006-1188  BID: 17468	This strike exploits a vulnerability in Microsoft Internet Explorer when parsing HTML tags.
Strike Internet Explorer MDAC RDS.DataSpace ActiveX Code Execution Variant 1	CVE: 2006-0003  BID: 17462	This strike exploits a code execution vulnerability in the RDS DataSpace ActiveX control, using Internet Explorer.
Strike Internet Explorer MDAC RDS.DataSpace ActiveX Code Execution Variant 2	CVE: 2006-0003  BID: 17462	This strike exploits a code execution vulnerability in the RDS DataSpace ActiveX control, using Internet Explorer.
Strike Internet Explorer MDAC RDS.DataSpace ActiveX Code Execution Variant 3	CVE: 2006-0003  BID: 17462	This strike exploits a code execution vulnerability in the RDS DataSpace ActiveX control, using Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer WMSpecialEffectDX T1Input.bstrPropertyName Memory Corruption	CWE: 94 CVE: 2006-1303 BID: 18328	This strike exploits a vulnerability in Microsoft Internet Explorer when instantiating the wmm2fxa.dll component.
Strike Microsoft Internet Explorer WMSpecialEffectDX TInplace1Input.bstrPropertyName Memory Corruption	CWE: 94 CVE: 2006-1303 BID: 18328	This strike exploits a vulnerability in Microsoft Internet Explorer when instantiating the wmm2fxa.dll component.
Strike Microsoft Internet Explorer WMSpecialEffectDX T2Inputs.bstrPropertyName Memory Corruption	CWE: 94 CVE: 2006-1303 BID: 18328	This strike exploits a vulnerability in Microsoft Internet Explorer when instantiating the wmm2fxa.dll component.
Strike Microsoft Internet Explorer HTML Frameset Memory Corruption	CVE: 2006-3637 BID: 18227	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer when rendering HTML using a crafted frameset.
Strike Microsoft Internet Explorer outerHTML attribute Information Disclosure	CVE: 2006-3280 BID: 18682	This strike exploits an information disclosure vulnerability in Microsoft Internet Explorer when processing javascript that references an object's outerHTML attribute.
Strike Microsoft Internet Explorer HTML Help HHCtrl ActiveX Memory Corruption	CVE: 2006-3357 BID: 18769	This strike exploits a denial of service vulnerability in the HTML Help ActiveX control when setting the image property.
Strike Internet Explorer WebViewFolderIcon ActiveX Control Memory Corruption	CWE: 94 CVE: 2006-3730 BID: 19030	This strike exploits a flaw in the setSlice function of the WebViewFolderIcon ActiveX Object included with Internet Explorer

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Object Packager Dialogue Spoofing (HTTP)	CWE: 94 CVE: 2006-4692 BID: 20318	This strike exploits a dialogue spoofing flaw in the Windows Object Packager. This flaw allows an attacker to embed a malicious object within a RTF or Microsoft Office document that appears to be a safe file type.
Strike Microsoft Internet Explorer DirectAnimation PathControl ActiveX Spline() Method Overflow	CVE: 2006-4446 BID: 19738	This strike exploits a vulnerability in Microsoft Internet Explorer when calling the Spline() method on the DirectAnimation.PathControl ActiveX control.
Strike Microsoft Internet Explorer Daxctle.OCX DirectX KeyFrame Method Overflow	CWE: 119 CVE: 2006-4777 BID: 20047	This strike exploits an overflow in the KeyFrame method of the direct animation DirectX control.
Strike Internet Explorer Daxctle.ocx ActiveX Object KeyFrame Heap Overflow	CWE: 119 CVE: 2006-4777 BID: 20047	This strike exploits a flaw in the DirectX Animation (daxctle.ocx) ActiveX control for Internet Explorer.
Strike Microsoft Internet Explorer XML Object Core Services Memory Corruption	CVE: 2006-5745 BID: 20915	This strike exploits a remote code execution vulnerability in a Microsoft Internet Explorer XML Core Services. Remote attacker can use this vulnerability to do code execution on the target system.
Strike Internet Explorer WMI Object Broker ActiveX Code Execution Variant 1	BID: 20843 CVE: 2006-4704	This strike exploits a code execution vulnerability in the WMI Object Broker ActiveX control, using Internet Explorer.
Strike Internet Explorer WMI Object Broker ActiveX Code Execution Variant 2	BID: 20843 CVE: 2006-4704	This strike exploits a code execution vulnerability in the WMI Object Broker ActiveX control, using Internet Explorer.
Strike Internet Explorer WMI Object Broker ActiveX Code Execution Variant 3	BID: 20843 CVE: 2006-4704	This strike exploits a code execution vulnerability in the WMI Object Broker ActiveX control, using Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Media Player ASX File Heap Overflow (HTTP)	CWE: 119 CVE: 2006-6134 BID: 21247	Microsoft Windows Media Player contains a vulnerability that will cause memory corruption when a malicious *.asx file is opened
Strike Internet Explorer VML Object Buffer Overflow	CVE: 2007-0024 BID: 21930	This strike exploits a buffer overflow flaw in the VML features of Internet Explorer
Strike Microsoft Word 2000 Malformed Function Code Execution (HTTP)	CVE: 2007-0515 BID: 22225	This strike exploits a code execution flaw in Microsoft Word 2000 that is triggered by a malformed function definition.
Strike Windows Animated Cursor (.ani) Handling Arbitrary Command Execution (HTTP)	CWE: 119 CVE: 2007-0038 BID: 23194	This strike exploits a code execution vulnerability in the Microsoft Windows animated cursor (.ani) file handling function.
Strike Microsoft Internet Explorer chtskdic.dll COM Object Instantiation Memory Corruption	CVE: 2007-0942 BID: 19529	Microsoft Internet Explorer 5.01 SP4 on Windows 2000 SP4; 6 SP1 on Windows 2000 SP4; 6 and 7 on Windows XP SP2, or Windows Server 2003 SP1 or SP2; and possibly 7 on Windows Vista does not properly instantiate certain COM objects as ActiveX controls, which allows remote attackers to execute arbitrary code via a crafted COM object from chtskdic.dll.
Strike BizTalk CAPICOM Certificates ActiveX Control Remote Code Execution	CVE: 2007-0940 BID: 23782	This strike exploits a memory corruption vulnerability in the CAPICOM ActiveX control included with BizTalk 2004.
Strike Microsoft Visio File Version Code Execution (HTTP)		This strike exploits an arbitrary code execution flaw in Microsoft Visio 2002. The vulnerability is triggered when a version is specified that is less than six and greater than zero.
Strike Internet Explorer COM Object Instantiation Pointer Memory Corruption Variant 1	BID: 24372 CWE: 94 CVE: 2007-0218	This strike exploits a memory corruption issue in Internet Explorer triggered by an uninitialized pointer returned via a malicious COM object instantiation.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer COM Object Instantiation Pointer Memory Corruption Variant 2	BID: 24372 CWE: 94 CVE: 2007-0218	This strike exploits a memory corruption issue in Internet Explorer triggered by an uninitialized pointer returned via a malicious COM object instantiation.
Strike Internet Explorer COM Object Instantiation Pointer Memory Corruption Variant 3	BID: 24372 CWE: 94 CVE: 2007-0218	This strike exploits a memory corruption issue in Internet Explorer triggered by an uninitialized pointer returned via a malicious COM object instantiation.
Strike Internet Explorer COM Object Instantiation Pointer Memory Corruption Variant 4	BID: 24372 CWE: 94 CVE: 2007-0218	This strike exploits a memory corruption issue in Internet Explorer triggered by an uninitialized pointer returned via a malicious COM object instantiation.
Strike Internet Explorer COM Object Instantiation Pointer Memory Corruption Variant 5	BID: 24372 CWE: 94 CVE: 2007-0218	This strike exploits a memory corruption issue in Internet Explorer triggered by an uninitialized pointer returned via a malicious COM object instantiation.
Strike Internet Explorer COM Object Instantiation Pointer Memory Corruption Variant 6	BID: 24372 CWE: 94 CVE: 2007-0218	This strike exploits a memory corruption issue in Internet Explorer triggered by an uninitialized pointer returned via a malicious COM object instantiation.
Strike Internet Explorer CSS Style Tag Memory Corruption	CVE: 2007-1750 CVE: 2007-0943	This strike exploits a flaw in Internet Explorer 6 caused by an invalid 'csstext' property in the 'style' attribute of an HTML tag.
Strike Internet Explorer Navigation Cancel Page XSS (About)	BID: 22966 CWE: 79 CVE: 2007-1499	This strike exploits a cross-site scripting flaw in Internet Explorer 7. This flaw can be used by an attacker to spoof the displayed document location and run javascript code in the context of the about:cancel context.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer Navigation Cancel Page XSS (Res)	BID: 22966 CWE: 79 CVE: 2007-1499	This strike exploits a cross-site scripting flaw in Internet Explorer 7. This flaw can be used by an attacker to spoof the displayed document location and run javascript code in the context of the about:cancel context.
Strike Internet Explorer Microsoft Speech API 4 ActiveX Overflow	BID: 24426 CWE: 119 CVE: 2007-2222	This strike exploits an overflow in the Microsoft Speech API version 4 using an ActiveX control
Strike Internet Explorer Windows API Resource ID Arbitrary Code Execution	BID: 24370 CVE: 2007-2219	This strike exploits a flaw in the Microsoft Windows API using Internet Explorer. This flaw is triggered when a resource URL is specified that contains an ID greater than 65535. A logic error results in the resource ID being treated as a pointer to a resource and deallocated using the RtlFreeHeap() function. Since the attacker controls the value of this ID, this can lead to code execution.
Strike Microsoft IIS ASP.NET NULL Byte Injection Information Disclosure Variant 1	BID: 24791 CWE: 200 CVE: 2007-0042	This strike bypasses the security features of an ASP.NET website by injecting a NULL character into the request URI.
Strike Microsoft IIS ASP.NET NULL Byte Injection Information Disclosure Variant 2	BID: 24791 CWE: 200 CVE: 2007-0042	This strike bypasses the security features of an ASP.NET website by injecting a NULL character into the request URI.
Strike Microsoft IIS ASP.NET NULL Byte Injection Information Disclosure Variant 3	BID: 24791 CWE: 200 CVE: 2007-0042	This strike bypasses the security features of an ASP.NET website by injecting a NULL character into the request URI.
Strike Microsoft IIS ASP.NET NULL Byte Injection Information Disclosure Variant 4	BID: 24791 CWE: 200 CVE: 2007-0042	This strike bypasses the security features of an ASP.NET website by injecting a NULL character into the request URI.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft XML Core Services substringData Attribute Integer Overflow	BID: 25301 CWE: 119 CVE: 2007-2223	This strike exploits an integer overflow vulnerability in the Microsoft XML Core Services control. This flaw is a combination of improper input validation in the XML software (MS07-042) and an integer overflow in the OLE Automation Library (MS07-043).
Strike Microsoft Internet Explorer Pdwizard.ocx ActiveX Object Memory Corruption	CVE: 2007-3041 BID: 25295	Unspecified vulnerability in the pdwizard.ocx ActiveX object for Internet Explorer 5.01, 6 SP1, and 7 allows remote attackers to execute arbitrary code via unknown vectors related to Microsoft Visual Basic 6 objects and memory corruption, aka "ActiveX Object Memory Corruption Vulnerability."
Strike Internet Explorer TLBINFO32.DLL Remote DLL Loading Code Execution Vulnerability	BID: 25289 CWE: 16 CVE: 2007-2216	This strike uses tlbinfo32.dll to load a malicious DLL from the remote machine and use it to execute code on the target machine.
Strike Windows GDI Malformed Image Denial of Service (HTTP)	BID: 25302 CWE: 189 CVE: 2007-3034	This strike exploits a denial-of-service vulnerability in Windows when handling malformed WMF files
Strike Microsoft Windows Vista Contact Gadget Remote Code Execution (HTTP)	CVE: 2007-3032 BID: 25304	This strike exploits a flaw in the Contact Gadget in Microsoft Vista when displaying a malicious contact.
Strike Microsoft Windows Vista RSS Feed Headlines Gadget Remote Code Execution Variant 1	CWE: 79 CVE: 2007-3033 BID: 25287	This strike exploits a flaw in the Feed Headlines Gadget in Microsoft Vista when displaying a malicious RSS feed.
Strike Microsoft Windows Vista RSS Feed Headlines Gadget Remote Code Execution Variant 2	CWE: 79 CVE: 2007-3033 BID: 25287	This strike exploits a flaw in the Feed Headlines Gadget in Microsoft Vista when displaying a malicious RSS feed.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Kodak Image Viewer TIFF BE File Parsing Code Execution (HTTP)	BID: 25909 CWE: 94 CVE: 2007-2217	This strike exploits a code execution vulnerability in the Kodak Image Viewer's TIFF (.tif) file handling function.
Strike Kodak Image Viewer TIFF LE File Parsing Code Execution (HTTP)	BID: 25909 CWE: 94 CVE: 2007-2217	This strike exploits a code execution vulnerability in the Kodak Image Viewer's TIFF (.tif) file handling function.
Strike Microsoft Windows PDF URI Handling Arbitrary Command Execution (HTTP)	CWE: 94 CVE: 2007-5020 BID: 25748	This strike exploits a command execution vulnerability in Microsoft Windows XP and 2003 URI handling via the Adobe Acrobat 8.x PDF (.pdf) "mailto" URI object's resolving functionality when paired with IE7 as the default URI handler.
Strike Microsoft DirectShow SAMI XML Attribute Overflow	CWE: 119 CVE: 2007-3901 BID: 26789	This strike exploits a bug in quartz.dll of DirectShow that gets triggered by a SAMI (closed captioning) file with an XML attribute that is very long
Strike Microsoft IIS ASP Engine HTMLEncode() Buffer Overflow	BID: 27676 CWE: 94 CVE: 2008-0075	This strike exploits a buffer overflow in the HTMLEncode function provided with the ASP scripting engine. This particular strike exploits this flaw through a sample script provided with the popular FCKeditor component.
Strike Microsoft Visual FoxPro ActiveX FoxDoCmd Control Buffer Overflow	CWE: 119 CVE: 2007-4790 BID: 25571	This strike exploits a buffer overflow in a Microsoft Visual FoxPro Activex control when calling the FoxDoCmd function.
Strike Microsoft Internet Explorer SVG AnimateMotion Memory Corruption	BID: 27666 CWE: 399 CVE: 2008-0077	This strike exploits a memory corruption bug in Microsoft Internet Explorer when rendering malicious SVG content.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Works RTF File Conversion Buffer Overflow (HTTP)	BID: 27659 CWE: 119 CVE: 2008-0108	This strike exploits a buffer overflow in the Microsoft Office and Microsoft Works file converter. A buffer overflow can be triggered when a corrupted Microsoft Works file is converted to the Rich Text Format (RTF).
Strike Microsoft Outlook mailto URI Argument Injection (altvba)	CWE: 94 CVE: 2008-0110 BID: 28147	This strike exploits a argument injection vulnerability in Microsoft Outlook. This flaw can be used to execute arbitrary code via the /altvba and /importprf options.
Strike Microsoft Outlook mailto URI Argument Injection (importprf)	CWE: 94 CVE: 2008-0110 BID: 28147	This strike exploits a argument injection vulnerability in Microsoft Outlook. This flaw can be used to execute arbitrary code via the /altvba and /importprf options.
Strike Microsoft Office Memory Corruption (PowerPoint) (HTTP)	BID: 28146 CWE: 94 CVE: 2008-0118	This strike exploits a memory corruption vulnerability in the Microsoft Office XP PowerPoint component.
Strike Microsoft Windows GDI Stack Overflow (HTTP)	BID: 28570 CWE: 119 CVE: 2008-1087	This strike sends a file that exploits a stack overflow flaw in GDI, a core component of the Microsoft Windows Graphical User Interface
Strike Internet Explorer Same-Origin XMLHttpRequest Header Forgery	CWE: 20 CVE: 2008-1544 BID: 28379	This strike exploits a vulnerability in the blocklisting mechanism employed by Internet Explorer 7 to enforce the same-origin policy for embedded XMLHttpRequest objects. Due to a problem in data sanitation, an attacker can use maliciously-crafted setRequestHeader() calls to an XMLHttpRequest objects to overwrite certain HTTP request headers.
Strike Internet Explorer Malicious SpSharedRecoContext ActiveX Illegal Instantiation	CWE: 94 CVE: 2007-0675 BID: 22359	This strike exploits a malicious instantiation of the Microsoft Speech Recognition 'SpSharedRecoContext' ActiveX control. The kill bit for this control has been issued by Microsoft in bulletin MS08-32, as this control is not intended to be invoked by Internet Explorer.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer Malicious SpSharedRecognizer ActiveX Illegal Instantiation	CWE: 94 CVE: 2007-0675 BID: 22359	This strike exploits a malicious instantiation of the Microsoft Speech Recognition 'SpSharedRecognizer' ActiveX control. The kill bit for this control has been issued by Microsoft in bulletin MS08-32, as this control is not intended to be invoked by Internet Explorer.
Strike DirectX AVI-ASF MJPEG Decoding Code Execution (HTTP)	BID: 29581 CWE: 119 CVE: 2008-0011	This strike exploits a code execution vulnerability in the DirectX MJPEG decoding component.
Strike Microsoft DirectShow SAMI CSS Attribute Overflow	CWE: 119 CVE: 2008-1444 BID: 29578	This strike exploits a bug in quartz.dll of DirectShow that gets triggered by a SAMI (closed captioning) file with an CSS attribute that is very long. CyPerf was unable to reproduce this vulnerability in its lab.
Strike Internet Explorer - Snapshot Viewer for Microsoft Access ActiveX Arbitrary File Download Variant 2	CWE: 94 CVE: 2008-2463 BID: 30114	This strike exploits a malicious instantiation of the Snapshot Viewer for Microsoft Access ActiveX control. Due to a design error, a malicious web page may silently download executable files from an Internet site to any location on the victim's hard drive, including auto-start extensibility points (ASEPs). These programs, in turn, may then silently run with the privileges of the currently-logged on user.
Strike Internet Explorer - Snapshot Viewer for Microsoft Access ActiveX Arbitrary File Download Variant 3	CWE: 94 CVE: 2008-2463 BID: 30114	This strike exploits a malicious instantiation of the Snapshot Viewer for Microsoft Access ActiveX control. Due to a design error, a malicious web page may silently download executable files from an Internet site to any location on the victim's hard drive, including auto-start extensibility points (ASEPs). These programs, in turn, may then silently run with the privileges of the currently-logged on user.
Strike Internet Explorer - Snapshot Viewer for Microsoft Access ActiveX Arbitrary File Download Variant 4	CWE: 94 CVE: 2008-2463 BID: 30114	This strike exploits a malicious instantiation of the Snapshot Viewer for Microsoft Access ActiveX control. Due to a design error, a malicious web page may silently download executable files from an Internet site to any location on the victim's hard drive, including auto-start extensibility points (ASEPs). These programs, in turn, may then silently run with the privileges of the currently-logged on user.
Strike Microsoft Office Smart Tag WordCount Memory Corruption (HTTP)	BID: 30124 CWE: 399 CVE: 2008-2244	This strike exploits a memory corruption vulnerability in Microsoft Office that is triggered when a Smart Tag structure containing an invalid WordCount value.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Excel Chart Record Array Index Vulnerability (HTTP)	BID: 30638 CWE: 20 CVE: 2008-3004	This strike exploits a code execution vulnerability in Microsoft Excel caused by loading a workbook with a malicious record.
Strike Microsoft Office Graphics Image Filter PICT Heap Overflow	BID: 30597 CWE: 94 CVE: 2008-3018	This strike exploits a heap-based buffer overflow in the Microsoft Office Graphics Image Filter for the PICT file format.
Strike Microsoft Office Graphics Image Filter PICT NULL Pointer Dereference	BID: 30598 CWE: 399 CVE: 2008-3021	This strike exploits a NULL pointer dereference in the Microsoft Office Graphics Image Filter for the PICT file format.
Strike Microsoft Office Graphics Image Filter PICT Memory Corruption (Fatal)	BID: 30598 CWE: 399 CVE: 2008-3021	This strike exploits a NULL pointer dereference in the Microsoft Office Graphics Image Filter for the PICT file format. This differs from the normal trigger for this exploit in that it is not wrapped by an exception filter and results in a fatal crash of the Office application.
Strike Microsoft Office Graphics Image Filter WPG Heap Overflow	BID: 30600 CWE: 399 CVE: 2008-3460	This strike exploits a heap overflow in the Microsoft Office Graphics Image Filter for the WPG file format.
Strike Internet Explorer HTML createTextRange() Memory Corruption	CWE: 399 CVE: 2008-2255	This strike exploits a memory corruption issue in Internet Explorer triggered by rapid calls to createTextRange().
Strike Internet Explorer ExecWB PrintPreview Remote Command Execution	BID: 30612 CWE: 20 CVE: 2008-2259	This strike exploits an insecure API call in Internet Explorer that enables scripting to run in the local zone.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer HTML Objects Uninitialized Memory	BID: 30614 CWE: 399 CVE: 2008-2254	This strike causes Internet Explorer to access uninitialized memory.
Strike Internet Explorer HTML Table Objects Memory Corruption	BID: 30610 CWE: 399 CVE: 2008-2258	This strike uses HTML Table objects to cause a memory corruption issue with Internet Explorer.
Strike Internet Explorer HTTP Code 449 Uninitialized Object Memory Corruption Vulnerability	BID: 30611 CWE: 20 CVE: 2008-2256	This strike replies to an HTTP request with code 449 (Retry) which will cause certain versions of Internet Explorer to crash.
Strike Internet Explorer Nested XHTML Object Memory Corruption	BID: 30613 CWE: 399 CVE: 2008-2257	This strike exploits a flaw in Internet Explorer caused by uninitialized memory and nested XHTML objects.
Strike Microsoft Color Management ColorMatchToTarget W (HTTP)	BID: 30594 CWE: 119 CVE: 2008-2245	This strike exploits a memory corruption vulnerability in the Microsoft Windows Color Management System when handling EMF files with a crafted EMR_COLORMATCHTOTARGETW record.
Strike Internet Explorer MHTML HTTP Redirect Cross Domain Information Disclosure	BID: 30585 CWE: 264 CVE: 2008-1448	This strike uses an MHTML redirect to cause Internet Explorer to allow script access to domains other than the originating site.
Strike Internet Explorer MSN Messenger ActiveX Control Information Disclosure Variant 1	BID: 30551 CWE: 200 CVE: 2008-0082	This strike exploits an information disclosure vulnerability present in Microsoft's MSN Messenger "Messenger.UIAutomation" ActiveX control. Due to a lack of controls around certain API functions, a malicious web page can harvest personally- identifying information without consent or notification to the user, including e-mail addresses and MSN screen names.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer MSN Messenger ActiveX Control Information Disclosure Variant 2	BID: 30551 CWE: 200 CVE: 2008-0082	This strike exploits an information disclosure vulnerability present in Microsoft's MSN Messenger "Messenger.UIAutomation" ActiveX control. Due to a lack of controls around certain API functions, a malicious web page can harvest personally- identifying information without consent or notification to the user, including e-mail addresses and MSN screen names.
Strike Microsoft PowerPoint Master Style Integer Overflow (HTTP)	BID: 30579 CWE: 399 CVE: 2008-1455	This strike exploits a memory corruption vulnerability in Microsoft PowerPoint when opening a file with a malformed Master Style attribute.
Strike Microsoft PowerPoint Viewer 2003 Picture Array Index (HTTP)	BID: 30552 CWE: 399 CVE: 2008-0120	This strike exploits an out-of-bounds array index vulnerability in Microsoft PowerPoint Viewer 2003 when reading malformed PowerPoint files.
Strike Microsoft PowerPoint Viewer 2003 MSODRAWING Property Heap Overflow (HTTP)	BID: 30554 CWE: 399 CVE: 2008-0121	This strike exploits a memory corruption vulnerability in Microsoft PowerPoint Viewer when processing a file with a malformed MSODRAWING Property Table.
Strike Microsoft GDI+ BMP Integer Overflow (HTTP)	BID: 31022 CWE: 189 CVE: 2008-3015	This strike exploits a BMP parsing flow caused by an invalid image width.
Strike Microsoft Internet Explorer Malformed GDI+ EMF Memory Corruption	BID: 31019 CWE: 119 CVE: 2008-3012	This strike exploits a memory corruption bug in Microsoft Internet Explorer when viewing EMF files containing a malformed floating point field.
Strike Microsoft Internet Explorer GDI+ GIF Parsing Record Count Memory Corruption	BID: 31020 CWE: 399 CVE: 2008-3013	This strike exploits a memory corruption bug in Microsoft Internet Explorer when parsing GIF files with a large number of GIF records.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer GDI+ VML Gradient Negative Focussize Variant 1	BID: 31018 CWE: 189 CVE: 2007-5348	This strike exploits an integer overflow bug in Microsoft Internet Explorer when rendering VML that contains negative FocusSize values.
Strike Microsoft Internet Explorer GDI+ VML Gradient Negative Focussize Variant 2	BID: 31018 CWE: 189 CVE: 2007-5348	This strike exploits an integer overflow bug in Microsoft Internet Explorer when rendering VML that contains negative FocusSize values.
Strike Microsoft Windows Media Encoder IE ActiveX Control Overflow	BID: 31065 CWE: 119 CVE: 2008-3008	This strike exploits an overflow in the Windows Media Encoder ActiveX Control using Internet Explorer as a vector.
Strike Microsoft OneNote URI Handler Injection Arbitrary File Write	BID: 31067 CWE: 20 CVE: 2008-3007	This strike will load a malicious HTML file that will connect to a remote server, download an Office OneNote file, and save any inserted files to a directory specified by the malicious author.
Strike Microsoft Excel BIFF Record Parsing Vulnerability (HTTP)	BID: 31705 CWE: 399 CVE: 2008-3471	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing crafted BIFF records.
Strike Microsoft Excel Embedded Object Validation Vulnerability (HTTP)	BID: 31702 CWE: 399 CVE: 2008-3477	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing an embedded object.
Strike Microsoft Excel REPT() Formula Parsing Vulnerability (HTTP)	BID: 31706 CWE: 189 CVE: 2008-4019	This strike exploits a vulnerability in Microsoft Excel when evaluating a REPT() formula with a long number_times parameter.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer Cross Domain Cookie Theft Variant 1	BID: 31615 BID: 31654 CWE: 264 CVE: 2008-3472	This strike exploits an information disclosure vulnerability present in Microsoft Internet Explorer. Due to an issue in enforcing the same-origin policy within Internet Explorer, a malicious web page can read from and write to the content of a child iframe. Using this vulnerability, an attacker can interact with the child frame on behalf of the user without further user interaction.
Strike Microsoft Internet Explorer Cross Domain Cookie Theft Variant 2	BID: 31616 CWE: 264 CVE: 2008-3473	This strike exploits an information disclosure vulnerability present in Microsoft Internet Explorer. Due to an issue in enforcing the same-origin policy within Internet Explorer, a malicious web page can read from and write to the content of a child iframe. Using this vulnerability, an attacker can interact with the child frame on behalf of the user without further user interaction.
Strike Microsoft Internet Explorer Cross Domain Cookie Theft Variant 3	CWE: 284 CVE: 2008-2947 BID: 29986	This strike exploits an information disclosure vulnerability present in Microsoft Internet Explorer. Due to an issue in enforcing the same-origin policy within Internet Explorer, a malicious web page can change the location of a pop-up window or frame. Using this vulnerability, an attacker can interact with the window or frame on behalf of the user without further user interaction.
Strike Internet Explorer DOM XML Heap Corruption Variant 1	BID: 31617 CWE: 399 CVE: 2008-3475	This strike exploits a heap memory corruption vulnerability present in Microsoft Internet Explorer. Due to a misallocation of memory during certain DOM manipulation actions, a malicious web page can cause an exception within Internet Explorer.
Strike Internet Explorer DOM XML Heap Corruption Variant 2	BID: 31618 CWE: 399 CVE: 2008-3476	This strike exploits a heap memory corruption vulnerability present in Microsoft Internet Explorer. Due to a misallocation of memory during certain DOM manipulation actions, a malicious web page can cause an exception within Internet Explorer.
Strike Microsoft XML Core Services DTD Cross-Domain Scripting External Parameter Entity	BID: 32155 CWE: 200 CVE: 2008-4029	This strike simulates a cross-domain scripting vulnerability in Microsoft XML Core Services that occurs when Microsoft Internet Explorer uses the MSXML ActiveX control to load a DTD with an external parameter entity.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Visual Basic Charts ActiveX Control DoSetCursor Parameter Memory Corruption	BID: 32614 CWE: 399 CVE: 2008-4256	This strike simulates an attack against the Visual Basic 6.0 Charts ActiveX Control that is triggered when setting the DoSetCursor parameter.
Strike Microsoft Visual Basic DataGrid ActiveX Control Text Parameter Memory Corruption	BID: 32591 CWE: 264 CVE: 2008-4252	This strike simulates an attack against the Visual Basic 6.0 DataGrid ActiveX Control that is triggered when setting the Text parameter.
Strike Microsoft Visual Basic FlexGrid ActiveX Control FormatString Parameter Memory Corruption	BID: 32592 CWE: 399 CVE: 2008-4253	This strike simulates an attack against the Visual Basic 6.0 FlexGrid ActiveX Control that is triggered when setting the FormatString parameter.
Strike Microsoft Visual Basic Hierarchical FlexGrid ActiveX Control Rows Parameter Memory Corruption	CWE: 189 CVE: 2008-4254	This strike simulates an attack against the Visual Basic 6.0 Hierarchical FlexGrid ActiveX Control that is triggered when setting the Rows parameter.
Strike Microsoft Visual Basic Masked Edit ActiveX Control Mask Parameter Memory Corruption	CWE: 119 CVE: 2008-3704 BID: 30674	This strike simulates an attack against the Visual Basic 6.0 Masked Edit ActiveX Control that is triggered when setting the Mask parameter.
Strike Microsoft GDI DIBBITBLT HeaderSize Integer Overflow (HTTP)	CWE: 189 CVE: 2008-2249	This strike exploits an integer overflow when handling the HeaderSize value from the DIBHeader structure contained within a Widows Meta File (WMF) DIBBITBLT record.
Strike Microsoft GDI DIBSTRETCHBLT HeaderSize Integer Overflow (HTTP)	CWE: 189 CVE: 2008-2249	This strike exploits an integer overflow when handling the HeaderSize value from the DIBHeader structure contained within a Widows Meta File (WMF) DIBSTRETCHBLT record.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Word RTF Object Parsing Vulnerability (HTTP)	CWE: 399 CVE: 2008-4027	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\do' directives.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpcallout) (HTTP)	CWE: 119 CVE: 2008-4028	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\dpcallout' directives.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpPENDGROUP) (HTTP)	CWE: 399 CVE: 2008-4030	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\dpPENDGROUP' directives.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpolycount) (HTTP)	CWE: 119 CVE: 2008-4025	This strike exploits a vulnerability in MS Word caused by an RTF file with an invalid '\dpolycount' directive.
Strike Microsoft Word RTF Object Parsing Vulnerability (stylesheet) (HTTP)	CWE: 399 CVE: 2008-4031	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\stylesheet' directives.
Strike Microsoft Word Memory Corruption Vulnerability (HTTP) (Array Index)	CWE: 399 CVE: 2008-4026	This strike exploits a vulnerability in MS Word that uses an unchecked offset into an array.
Strike Microsoft Word Memory Corruption Vulnerability (HTTP) (Arbitrary Free)	CWE: 94 CVE: 2008-4024	This strike exploits a vulnerability in MS Word that allows a malicious document to run 'free()' on an arbitrary address.
Strike Microsoft Word Table Property Stack Overflow (HTTP)	CWE: 119 CVE: 2008-4837	This strike exploits a vulnerability in MS Word caused when processing an invalid table property.
Strike Internet Explorer HTML Iframe Object Buffer Overflow	CWE: 399 CVE: 2008-4259	This strike exploits a buffer overflow vulnerability present in Microsoft Internet Explorer. Due to an issue involving certain HTML objects, a malicious web page can overflow a static buffer, leading to system instability and the possibility of remote code execution.

Name	References	Description
Strike Internet Explorer HTML Embed Rendering Buffer Overflow	CWE: 399 CVE: 2008-4261	This strike exploits a buffer overflow vulnerability present in Microsoft Internet Explorer. Due to an issue rendering certain HTML elements, a malicious web page can supply malicious data via Internet Explorer, leading to system instability and the possibility of remote code execution.
Strike Internet Explorer Navigation Parameter Buffer Overflow Variant 1	CWE: 399 CVE: 2008-4258 BID: 32596	This strike exploits a buffer overflow vulnerability present in Microsoft Internet Explorer. Due to an issue involving web site navigation, a malicious web page can cause Internet Explorer to miscalculate the buffer size required for certain elements, leading to system instability and the possibility of remote code execution.
Strike Internet Explorer Navigation Parameter Buffer Overflow Variant 2	CWE: 399 CVE: 2008-4258 BID: 32596	This strike exploits a buffer overflow vulnerability present in Microsoft Internet Explorer. Due to an issue involving web site navigation, a malicious web page can cause Internet Explorer to miscalculate the buffer size required for certain elements, leading to system instability and the possibility of remote code execution.
Strike Microsoft Excel Obj Record Invalid Subtype Vulnerability (HTTP)	BID: 32621 CWE: 399 CVE: 2008-4264	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing an embedded object with an invalid subtype record.
Strike Microsoft Windows Search search-ms URL Protocol Handler Vulnerability	CWE: 399 CVE: 2008-4269	This strike exploits a vulnerability in Windows Internet Explorer when opening a malicious URL using the search-ms protocol.
Strike Microsoft Internet Explorer XML Data Binding Memory Corruption	CWE: 399 CVE: 2008-4844 BID: 32721	This strike simulates a memory corruption flaw in Microsoft Internet Explorer's data binding functionality. This vulnerability was discovered in the wild.
Strike Internet Explorer Cascading Style Sheet Visibility Manipulation Buffer Overflow	BID: 33627 CWE: 399 CVE: 2009-0075	This strike exploits a buffer overflow vulnerability present in Microsoft Internet Explorer. Due to an issue handling certain span and block elements when they are manipulated via CSS after they have been rendered in the DOM, a malicious web page can trigger an uninitialized memory corruption condition in Internet Explorer, leading to system instability and remote code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Internet Explorer DOM Deleted Object Buffer Overflow	BID: 33627 CWE: 399 CVE: 2009-0075	This strike exploits a buffer overflow vulnerability present in Microsoft Internet Explorer. Due to an issue handling certain objects after they are deleted from the Document Object Model (DOM), a malicious web page can trigger an uninitialized memory corruption condition in Internet Explorer, leading to system instability and remote code execution.
Strike Microsoft Windows EMF Polyline (HTTP)	BID: 34012 CWE: 20 CVE: 2009-0081	This strike exploits a vulnerability in Microsoft Windows when parsing an EMF file with crafted EMR_POLYLINE data.
Strike Microsoft Office Text Converter Integer Underflow Code Execution (HTTP Corrupt)	CVE: 2009-0087	This strike exploits an integer underflow code execution vulnerability in Microsoft Office's text convertor.
Strike Microsoft Office Text Converter Integer Underflow Code Execution (HTTP Direct)	CVE: 2009-0087	This strike exploits an integer underflow code execution vulnerability in Microsoft Office's text convertor.
Strike Internet Explorer - Uninitialized Memory Corruption Vulnerability Variant 1	CWE: 94 CVE: 2009-0552	This strike exploits an uninitialized memory corruption vulnerability present in Microsoft Internet Explorer. Due to an issue in accessing a memory location which has not been properly initialized, a malicious web page can trigger a double-free heap corruption condition in Internet Explorer, leading to system instability and remote code execution.
Strike Internet Explorer - Uninitialized Memory Corruption Vulnerability Variant 2	CWE: 399 CVE: 2009-0554	This strike exploits an uninitialized memory corruption vulnerability present in Microsoft Internet Explorer. Due to an issue in accessing a memory location which has not been properly initialized, a malicious web page can trigger an access violation condition in Internet Explorer, leading to system instability and remote code execution.
Strike Internet Explorer - Uninitialized Memory Corruption Vulnerability Variant 3	BID: 34424 CWE: 399 CVE: 2009-0553	This strike exploits an uninitialized memory corruption vulnerability present in Microsoft Internet Explorer. Due to an issue in accessing a memory location which has not been properly initialized, a malicious web page can trigger a double-free heap corruption condition in Internet Explorer, leading to system instability and remote code execution.
Strike ISA Server 2006 XSS in CookieAuth.dll	CWE: 79 CVE: 2009-0237	A cross-site scripting vulnerability exists in Microsoft ISA Server 2006.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft PowerPoint Current User Length Buffer Overflow (HTTP)	BID: 34841 CWE: 119 CVE: 2009-1131	This strike exploits a stack overflow vulnerability in Microsoft PowerPoint that is triggered by a Current user object with a length greater than 255 bytes.
Strike Microsoft Office PowerPoint 7 Converter Code Execution (HTTP)	BID: 34837 CWE: 94 CVE: 2009-1128	This strike exploits a code execution vulnerability in Microsoft Office PowerPoint's PowerPoint 7 converter.
Strike Microsoft Office PowerPoint Code Execution (HTTP)	BID: 34840 CWE: 119 CVE: 2009-1130	This strike exploits a code execution vulnerability in Microsoft Office PowerPoint.
Strike Microsoft PowerPoint TextHeaderAtom Freed Memory Heap Corruption (HTTP)	BID: 34351 CWE: 94 CVE: 2009-0556	This strike exploits a heap memory corruption vulnerability in Microsoft Office's PowerPoint.
Strike Microsoft Office PP7 Stack Overflow Vulnerability (HTTP)	BID: 34839 CWE: 119 CVE: 2009-1129	This strike exploits a stack overflow vulnerability in Microsoft Office PowerPoint when viewing a crafted PowerPoint document.
Strike Internet Explorer DHTML Table Object Memory Corruption	CWE: 399 CVE: 2009-1141 BID: 35198	This strike exploits a flaw in Internet Explorer that causes a memory corruption issue when encountering malicious DHTML.
Strike Microsoft Internet Explorer 8 DOM Object Dangling Pointer Memory Corruption	CWE: 399 CVE: 2009-1532	This strike exploits a flaw in Internet Explorer's handling of certain DOM Objects that can result in code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Office Excel OBJ Record Parsing Remote Code Execution (HTTP)	CWE: 94 CVE: 2009-0557 BID: 34351	This strike sends a malicious Office Excel document that can execute arbitrary code.
Strike Microsoft DirectShow Large ImageDescription Name Size Code Execution (HTTP)	BID: 35139 CVE: 2009-1537	This strike exploits a vulnerability in Microsoft DirectShow when parsing a media file containing maliciously formatted QuickTime data.
Strike Microsoft Embedded OpenType Font Parser Code Execution (HTTP)	CWE: 119 CVE: 2009-0231	This strike exploits a vulnerability in Microsoft's Embedded OpenType file parsing engine when parsing an EOT file containing malicious OpenType font file structure data.
Strike Microsoft ASP.NET Request Scheduling DoS	BID: 35985 CWE: 20 CVE: 2009-1536	This strike exploits a DoS bug in the Microsoft .NET Framework via IIS with ASP.NET configured to use integrated mode.
Strike Microsoft DirectShow (msvidctl.dll) MPEG-2 Memory Corruption	BID: 35558 BID: 35585 CWE: 119 CVE: 2008-0015	This strike exploits a memory corruption vulnerability in the MSVidCtl component of Microsoft DirectShow. An attacker can use a malicious GIF file to trigger a buffer overflow and execute arbitrary code.
Strike Microsoft Windows AVIFile Media File Truncation Code Execution (HTTP)	BID: 35967 CWE: 94 CVE: 2009-1545	This strike exploits a vulnerability in Microsoft Windows when parsing an AVI file with truncated AVIH chunk data.
Strike Microsoft OWC Spreadsheet ActiveX Control Memory Corruption	CWE: 94 CVE: 2009-1136	This strike exploits a memory corruption vulnerability in the Office Web Component (OWC) Spreadsheet ActiveX control.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Outlook Web Components ActiveX Spreadsheet Control Overflow	CWE: 119 CVE: 2009-1534 BID: 35992	This strike exploits a stack overflow with an SEH overwrite in the Outlook Web Components Spreadsheet ActiveX Control. The HTMLURL property is used as the attack vector delivered via HTML/JavaScript code rendered in Internet Explorer.
Strike JScript Scripting Engine Keyword Override Remote Code Execution	CWE: 94 CVE: 2009-1920	This strike exploits a remote code execution vulnerability in the JScript engine. This vulnerability is triggered when a malicious script attempts to override a keyword with a function declaration and then calls the function.
Strike Windows ASF Media File Format Parsing Code Execution (HTTP)	CWE: 94 CVE: 2009-2498	This strike exploits a code execution vulnerability in the Microsoft Windows Media Format Runtime and Windows Media Services file parsing function for Advanced System Format (.ASF/.WMV/.WMA) files.
Strike Windows MP3 Media File Format Parsing Code Execution (HTTP)	CWE: 94 CVE: 2009-2499	This strike exploits a code execution vulnerability in the Microsoft Windows Media Format Runtime and Windows Media Services file parsing function for MP3 files.
Strike Windows Media Player ASF Media File Format Parsing Code Execution (HTTP)	CWE: 119 CVE: 2009-2527	This strike exploits a code execution vulnerability in Microsoft Windows Media Player 6.4 when parsing an Advanced System Format (.ASF/.WMV/.WMA) file containing a Header Extension Object which contains a Index Object with an overly large IndexEntriesCount value.
Strike Windows Media Player ASF Media File Format Header Extension Parsing Code Execution (HTTP)	CWE: 119 CVE: 2009-2527	This strike exploits a code execution vulnerability in Microsoft Windows Media Player 6.4 when parsing an Advanced System Format (.ASF/.WMV/.WMA) file containing a Header Extension Object which contains a Marker Object with an overly large MarkersCount value.
Strike Microsoft Internet Explorer createEventObject propertyName Double Free	CWE: 94 CVE: 2009-2530	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer when creating event objects in javascript.
Strike Microsoft Internet Explorer createEventObject qualifier Double Free	CWE: 94 CVE: 2009-2530	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer when creating event objects in javascript.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer createEventObject srcUrn Double Free	CWE: 94 CVE: 2009-2530	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer when creating event objects in javascript.
Strike Microsoft Internet Explorer createEventObject type Double Free	CWE: 94 CVE: 2009-2530	This strike exploits a memory corruption vulnerability in Microsoft Internet Explorer when creating event objects in javascript.
Strike Microsoft Indexing Service Loop Counter Underwrap	CVE: 2009-2507	This strike exploits a vulnerability in the Microsoft Indexing Service by passing a specially crafted URL to the DecodeURLEscapes() function via an ActiveX control.
Strike Microsoft .NET CLR ArgIterator Stack Pointer Manipulation	CWE: 264 CVE: 2009-0090	This strike uses a web page to instantiate a malicious .NET app that will exploit a flaw in how the .NET CLR implements variable arguments for functions.
Strike GDI+ PNG Integer Overflow Vulnerability (HTTP)	CWE: 189 CVE: 2009-3126	This strike exploits the way the buffer size for the pixel data in interlaced PNGs is calculated by GDI+. The methods used by GDI+ contain integer overflow vulnerabilities.
Strike Microsoft GDI+ WMF Integer Overflow (HTTP)	CWE: 189 CVE: 2009-2500	This strike exploits an arbitrary code execution flaw in the Microsoft GDI+ Rendering Engine for WMF files. This vulnerability is triggered when an overflow integer is passed to an unchecked call to memcpy resulting in a heap-based buffer overflow. Because the flaw is in the underlying GDI+ rendering engine, anything which renders WMF files via GDI+ is affected and vulnerable.
Strike Microsoft Web Services for Devices (WSD) API Stack Buffer Overflow	CWE: 94 CVE: 2009-2512	This strike exploits a vulnerability in the Microsoft Web Services for Devices (WSD) API. The API does not properly handle overly-long Mime-Version header values which allows an attacker to overwrite a single NULL byte on the stack via an overflow of the buffer that the Mime-Version header value is written to.
Strike Microsoft Web Services for Devices (WSD) API Mime-Version Stack Buffer Overflow	CWE: 94 CVE: 2009-2512	This strike exploits a vulnerability in the Microsoft Web Services for Devices (WSD) API. The API does not properly handle overly-long Mime-Version header values which allows an attacker to overwrite a single NULL byte on the stack via an overflow of the buffer that the Mime-Version header value is written to.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Embedded OpenType Font Parser Directory Entry Summed Length & Offset Integer Wrap Code Execution (HTTP)	CWE: 94 CVE: 2009-2514	This strike exploits a vulnerability in Microsoft's Embedded OpenType file parsing engine when parsing an EOT file containing a directory entry where the directory entry's length and offset summed cause an integer wrap. This wrapped integer is then subsequently used to allocate memory for the directory. When the directory data is then written to the allocated buffer, it is overflowed resulting in heap corruption and control of code execution.
Strike Microsoft Office Excel Cache Code Execution (HTTP)	CWE: 94 CVE: 2009-3127	This vulnerability is triggered when Microsoft Excel parses an XLS file which contains a pivot cache stream with an SXDB record with a cfdbdb member value that is larger than the accompanying cfdbTot value. This causes Excel to access memory beyond the bounds of an array, resulting in potential arbitrary code execution. May require user interaction via clicking inside the PivotTable object to produce malicious conditions.
Strike Microsoft Excel Field Sanitization (HTTP)	CWE: 94 CVE: 2009-3134 BID: 36912	Versions of Microsoft Excel prior to the MS09-067 patch contain a vulnerability in which an attacker-controlled value is used to calculate an index into an array, which can lead to arbitrary code execution.
Strike Microsoft Office Word File Information Memory Corruption Vulnerability (HTTP)	CWE: 119 CVE: 2009-3135 BID: 36950	This strike exploits a vulnerability in the way Microsoft Word parses the FIB in Word documents, causing it to copy large amounts of data from the file onto the heap, resulting in possible code execution.
Strike Internet Explorer HTML Object Memory Corruption	CWE: 94 CVE: 2009-3672 BID: 37085	This strike exploits a flaw in Internet Explorer 6 and 7 where objects that were not properly initialized get used, which causes memory corruption and could potentially allow remote attackers to execute arbitrary code.
Strike Microsoft Embedded OpenType Font LZCOMP Decompressor Array Index Overflow Code Execution (HTTP)	BID: 37671 CWE: 189 CVE: 2010-0018	This strike exploits a vulnerability in Microsoft's Embedded OpenType file LZCOMP decompression engine when decompressing a LZX-compressed EOT file where there is the potential for a value used as an array index to overflow, resulting in a read access violation.
Strike Microsoft Internet Explorer HTML Object Use After Free (Aurora)	CWE: 94 CVE: 2010-0248 BID: 37894	This strike exploits a vulnerability in Microsoft Internet Explorer where a pointer to an HTML object can be used even after it has been freed, leading to memory corruption and potentially arbitrary code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft PowerPoint Viewer TextBytes Atom Record Stack Overflow Code Execution (HTTP)	CWE: 119 CVE: 2010-0033	This vulnerability is triggered when PowerPoint attempts to parse a PowerPoint file containing a TextBytes atom with an invalid size value. The unsigned size value read from the file is treated as a signed integer and compared to the signed constant value of 254. This flaw results in the large value being passed to a wrapper to memcpy, which causes an overflow of the stack buffer being written to resulting in stack corruption and potential arbitrary code execution.
Strike Microsoft PowerPoint Viewer TextChars Atom Record Stack Overflow Code Execution (HTTP)	CWE: 119 CVE: 2010-0034	This vulnerability is triggered when PowerPoint attempts to parse a PowerPoint file containing a TextChars atom with an invalid size value. The unsigned size value read from the file is treated as a signed integer and compared to the signed constant value of 254. This flaw results in the large value being passed to a wrapper to memcpy, which causes an overflow of the stack buffer being written to resulting in stack corruption and potential arbitrary code execution.
Strike Microsoft Paint JPEG Integer Overflow Code Execution (HTTP)	CWE: 189 CVE: 2010-0028	This strike transfers a malicious JPG file containing overly-large height and width values. A JPG such as the one described triggers a vulnerability in Microsoft Paint when the application evokes GDI+ to convert the JPG image into a BMP image. Such large height and width values can cause GDI+ to wrap an integer used for memory allocation calculations, resulting in the failure of Paint to reallocate a buffer being written to. Paint will then write data past the end of this buffer, resulting in a write access violation.
Strike Internet Explorer URL Protocol Validation (Command Exec)	CWE: 94 CVE: 2010-0027 BID: 37884	This strike exploits a flaw in Internet Explorer's handling of URL protocol types that leads to bypassing security restrictions.
Strike Internet Explorer URL Protocol Validation (File Access)	CWE: 94 CVE: 2010-0027 BID: 37884	This strike exploits a flaw in Internet Explorer's handling of URL protocol types that leads to bypassing security restrictions.
Strike Microsoft DirectShow AVI Invalid biCrlUsed Value (HTTP)	BID: 38112 CWE: 119 CVE: 2010-0250	This strike triggers a vulnerability when an AVI file containing a video chunk with an invalid biCrlUsed value is used in a GraphEdt.exe AVI/WAVE File Source filter, then that filter's video pin is connected to the input pin of an AVI Splitter filter. NOTE: While the malicious file transferred over the network by this strike is required to trigger the vulnerability, actually triggering the vulnerability requires a considerable amount of user interaction with the malicious file within GraphEdt.exe.
Strike Windows Movie Maker and Producer Buffer Overflow (HTTP)	CWE: 119 CVE: 2010-0265	This strike exploits the way the buffer size for the WmtoolsValid directory structure is allocated. An overly large value will cause an overflow that leads to an application crash and has the potential for code execution. This seems to be related to MS10-016.

Name	References	Description
Strike Microsoft Office Excel Sheet Object Type Confusion Code Execution (BIFF5) (HTTP)	CWE: 94 CVE: 2010-0258	This vulnerability is triggered when Microsoft Excel parses a BIFF5 file that contains ptgArea3d or ptgRef3d BRAI records with an ib (XTI) value of an index into the Worksheet's ExternSheet record's rgXTI array where the XTI structure at that index has either: (a) An encoding value of 2 and the BoundSheet at the same index as the XTI index value in the Worksheet Globals has a dt value greater than 1; or (b) An encoding value other than 2 and the BoundSheet in the Worksheet Globals that matches the name specified in the ExternSheet's rgch value has a dt value greater than 1. The vulnerable code's sanity check on the dt value only verifies that the value is non-zero. By passing an invalid value greater than 1, the sanity check is passed. Later, the pointer to the Chart sheet is re-used as a pointer to a larger Sheet sheet structure, resulting in a read access violation as data is attempted to be read beyond the size of the Chart sheet structure.
Strike Microsoft Office Excel Sheet Object Type Confusion Code Execution (BIFF8) (HTTP)	CWE: 94 CVE: 2010-0258	This vulnerability is triggered when Microsoft Excel parses a BIFF8 file that contains ptgArea3d or ptgRef3d BRAI records with a ptgrgc.PTGWithXTI.ib (XTI) value of an index into the Worksheet Globals ExternSheet record's rgXTI array where the XTI structure at that index has an iTabFirst value of an index into the Worksheet Globals array of BoundSheet records where the record at that index has a dt value greater than 1. The vulnerable code's sanity check on the dt value only verifies that the value is non-zero. By passing an invalid value greater than 1, the sanity check is passed. Later, the pointer to the Chart sheet is re-used as a pointer to a larger Sheet sheet structure, resulting in a read access violation as data is attempted to be read beyond the size of the Chart sheet structure.
Strike Microsoft Internet Explorer Tabular Data ActiveX Control Stack Corruption	BID: 39025 CWE: 94 CVE: 2010-0805	This strike exploits a vulnerability in the Internet Explorer Tabular Data ActiveX control where by an overly-long "DataURL" parameter to the ActiveX control can cause a NULL byte to be written outside the bounds of an array. Arbitrary code execution is possible by controlling where the byte is written on the call stack.
Strike Microsoft Internet Explorer Tabular Data Control ActiveX Memory Corruption	CWE: 94 CVE: 2010-0805 BID: 39025	This strike exploits a vulnerability in the Tabular Data ActiveX control. The way the url is parsed allows an attacker to write a null byte to an unplanned stack address, which may lead to arbitrary code execution.
Strike MPEG Layer-3 Audio Decoder Stack Overflow Vulnerability (HTTP)	CWE: 119 CVE: 2010-0480	This strike exploits a vulnerability in how MPEG Layer-3 (mp3) data is parsed in an AVI file. If a value is present in the nSamplesPerSec field that is not in the case statement used in the parsing code, a stack overflow may occur, leading to possible code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Media Player ActiveX Missing Codec	CVE: 2010-0268 BID: 39351	This strike triggers a vulnerability in the ActiveX control for Windows Media Player 9. The vulnerability is triggered when Windows Media Player 9 attempts to use a stale pointer after attempting to download a missing codec.
Strike Windows Media Player Decompression Vulnerability (HTTP)	CWE: 94 CVE: 2010-1879 BID: 40432	This strike exploits a vulnerability in the way JPEG frames in AVI files are parsed by Windows Media Player. Invalid Huffman table entries can lead to arbitrary code execution.
Strike Microsoft Excel SxView Record Parsing Heap Corruption (HTTP)	CWE: 94 CVE: 2010-1245	This strike exploits an arbitrary program execution flaw in Microsoft Excel 2002. This vulnerability is triggered when a malformed SxView record is parsed in a malicious XLS file.
Strike Microsoft Excel WOPT Record Parsing Vulnerability (HTTP)	BID: 40522 CWE: 94 CVE: 2010-0824	This strike exploits an arbitrary program execution vulnerability within Microsoft Excel 2002, part of the Microsoft Office XP suite. This flaw is triggered when Excel parses a malformed WOPT record in a maliciously crafted XLS file.
Strike Microsoft SharePoint Server 2007 Cross Site Scripting Vulnerability	CWE: 79 CVE: 2010-0817 BID: 39776	Microsoft Sharepoint Server 2007 contains a vulnerability in its "_layouts/help.aspx" page that can allow an attacker to inject his own html into the page via the "cid0" URL parameter and perform a cross-site-scripting attack.
Strike XML Signature HMAC Truncation Authentication Bypass (Server Response)	CVE: 2009-0217 BID: 35671	The specification for including HMAC-SHA1 signatures in XML documents includes a way to specify that only the first 'n' bits of the signature need to be verified. This can be done through the use of the HMACOutputLength tag. XML is commonly used to interact with webservices, many of which utilize this functionality. A client or server can specify a low (one bit being the minimum) HMACOutputLength value, causing the receiving party to verify only HMACOutputLength bits, increasing the chances that the sender will gain unauthorized access to the web service.
Strike Microsoft Access ImexGrid Denial of Service	CWE: 94 CVE: 2010-0814	This strike exploits a vulnerable ActiveX control (ImexGrid.AddColumn()) in Microsoft Access 2003 ACCWIZ.DLL which results in memory corruption and potential code execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Access ImexGrid Denial of Service Variant 2	CWE: 94 CVE: 2010-0814	This strike exploits a vulnerable ActiveX control (ImexGrid.DeleteColumn()) in Microsoft Access 2003 ACCWIZ.DLL which results in memory corruption and potential code execution.
Strike Microsoft Access ImexGrid Denial of Service Variant 3	CWE: 94 CVE: 2010-0814	This strike exploits a vulnerable ActiveX control (ImexGrid.AddColumn()) in Microsoft Access 2003 ACCWIZ.DLL which results in memory corruption and potential code execution.
Strike Microsoft Access ImexGrid Denial of Service Variant 4	CWE: 94 CVE: 2010-0814	This strike exploits a vulnerable ActiveX control (ImexGrid.DeleteColumn()) in Microsoft Access 2003 ACCWIZ.DLL which results in memory corruption and potential code execution.
Strike Internet Explorer Uninitialized Pointer Memory Corruption	CWE: 94 CVE: 2010-2559	This strike triggers a vulnerability in Internet Explorer 8 that causes an uninitialized pointer to be used, which can lead to memory corruption and arbitrary code execution.
Strike Microsoft Cinepak Codec CVDecompress Heap Overflow (HTTP)	CWE: 94 CVE: 2010-2553	This strike exploits an arbitrary program execution flaw in Microsoft Windows (XP,Vista,7) Cinepak Codec CVDecompression routine. This flaw is triggered by incorrect parsing of crafted Cinepak compressed data in a malicious AVI file.
Strike Microsoft Office Excel SXDB Record Parsing Buffer Overflow (HTTP)	CWE: 94 CVE: 2010-2562	This strike exploits a memory corruption vulnerability in Microsoft Excel by forcing Excel to parse a malformed SXDB record in a crafted XLS document, effectively leading to a stack-based buffer overflow and potential code execution conditions. May require user interaction via clicking inside the PivotTable object to produce malicious conditions.
Strike Microsoft Office Uninitialized Memory Corruption (HTTP)	BID: 43706 CWE: 94 CVE: 2010-3329	This strike exploits an arbitrary program execution flaw in Microsoft Office HtmlDlgHelper class caused by uninitialized memory usage and leads to stack memory corruption.
Strike Microsoft Office HtmlDlgHelper Uninitialized Memory Corruption (HTTP)	BID: 43706 CWE: 94 CVE: 2010-3329	This strike exploits an arbitrary program execution flaw in Microsoft Office HtmlDlgHelper class caused by uninitialized memory usage and leads to stack memory corruption.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Media Player Memory Corruption Vulnerability	CWE: 94 CVE: 2010-2745 BID: 43772	This strike exploits a vulnerability the way an html-embedded Windows Media Player (v9-12) de-allocates objects when the page is reloaded.
Strike Wordpad and Windows Shell Com Validation Vulnerability (HTTP)	BID: 40574 CWE: 94 CVE: 2010-1263	This strike attempts to use a blocklisted activex control in an rtf
Strike Microsoft Word RTF Stack Buffer Overflow (HTTP)	BID: 44652 CWE: 119 CVE: 2010-3333	This strike exploits a stack-based overflow vulnerability in the Microsoft Word RTF Parsing Engine and leads to potential code execution.
Strike Internet Explorer CSS Invalid Flag Reference Use After Free	CWE: 399 CVE: 2010-3962 BID: 44536	This strike exploits a heap memory corruption vulnerability present in Microsoft Internet Explorer due to an attempt to access an object that has not been correctly initialized or has been deleted.
Strike Internet Explorer HTML+Time outerText Memory Corruption	CWE: 94 CVE: 2010-3346 BID: 45261	This strike exploits a memory corruption vulnerability present in Microsoft Internet Explorer due to improper handling of the creation and deletion of HTML+TIME elements.
Strike Microsoft OpenType Font Index Vulnerability (HTTP) (Array Index)	CWE: 94 CVE: 2010-3956	This strike exploits a vulnerability in the Windows Open Type Font driver that uses an unchecked offset into an array.
Strike Internet Explorer MSADO CacheSize Integer Overflow	CWE: 20 CVE: 2011-0027 BID: 45698	This strike exploits an integer wrap vulnerability present in the MSADO component of Microsoft Internet Explorer when the CacheSize property of a MSADO recordset object is set to a large size. The vulnerability may allow remote code execution.

Name	References	Description
Strike CreateSizedDIBSection Stack-Based Buffer Overflow (HTTP)	CWE: 119 CVE: 2010-3970 BID: 45662	This strike exploits a stack-based buffer-overflow that occurs when an Office document with a thumbnail that has a negative biClrUsed value is parsed, which can lead to arbitrary code execution.
Strike Internet Explorer Object Management Use After Free	CVE: 2011-1345 BID: 46821	This strike triggers a use-after-free vulnerability present in versions of Internet Explorer prior to the April 2011 updates. This can lead to arbitrary code execution.
Strike Microsoft Internet Explorer 8 Developer Tools ActiveX	CWE: 94 CVE: 2010-0811 BID: 40490	This strike triggers a memory corruption vulnerability in iedvtool.dll (Internet Explorer 8 developer tools) by instantiating an object with clsid 1a6fe369-f28c-4ad9-a3e6-2bcb50807cf1 or 8fe85d00-4647-40b9-87e4-5eb8a52f4759.
Strike Internet Explorer HTTP Redirect Memory Corruption	CWE: 119 CVE: 2011-1262 BID: 48211	This strike exploits a flaw in Microsoft Internet Explorer that is triggered when an HTTP 30x redirect response is received that contains a reference to the CDL protocol in its Location header.
Strike Internet Explorer mshtml!CObjectElement Use After Free	CWE: 119 CVE: 2011-1260 BID: 48208	This strike triggers a use-after-free vulnerability in Microsoft Internet Explorer by generating an html page that contains an invalid object element that is covered by other html elements.
Strike Microsoft Internet Explorer Selection Object Use After Free	CWE: 119 CVE: 2011-1261 BID: 48210	This strike triggers a vulnerability in Internet Explorer by sending a specially crafted html page that contains a style tag using the selection.empty() method. The bug will be triggered if a user clicks anywhere on the page.
Strike Internet Explorer TIME Element Uninitialized Memory	CWE: 119 CVE: 2011-1255 BID: 48206	This strike sends an html page that will cause vulnerable versions of Internet Explorer to use uninitialized memory.

Name	References	Description
Strike Microsoft Internet Explorer VML Use After Free	CWE: 119 CVE: 2011-1266 BID: 48173	This strike triggers a vulnerability in Internet Explorer by sending a specially crafted html page that contains VML (Vector Markup Langauge). Scripts in the html page cause an object to be freed and then again used when the page is being destroyed.
Strike Microsoft Internet Explorer XSLT Memory Corruption	CWE: 119 CVE: 2011-1963 BID: 49037	Microsoft Internet Explorer 7 through 9 does not properly handle objects in memory, which allows remote attackers to execute arbitrary code by accessing an object that (1) was not properly initialized or (2) is deleted, aka XSLT Memory Corruption Vulnerability. This strike delivers a payload consistent with triggering the specified vulnerability.
Strike Microsoft Internet Explorer Style Object Memory Corruption	CWE: 119 CVE: 2011-1964 BID: 49039	This strike triggers a vulnerability in Internet Explorer by sending a specially crafted html page that contains a call to the addBehavior method with an invalid parameter on a style object.
Strike Microsoft Corrupted Bitmap Font	CWE: 119 CVE: 2011-2003	This strike exploits a denial of service vulnerability in Microsoft Windows's win32k.sys when viewing a corrupted bitmap font.
Strike Microsoft Internet Explorer Body Element Use-After-Free	CWE: 20 CVE: 2011-2000 BID: 49965	This strike triggers a vulnerability in Internet Explorer by sending a specially crafted html page that contains a call to the clearAttributes method on the body element followed by subsequent references to that element.
Strike Microsoft Internet Explorer VTable Memory Corruption	CWE: 20 CVE: 2011-2001 BID: 49966	This strike triggers a vulnerability in Internet Explorer by sending a specially crafted html page that contains a marquee element with an embedded style tag that is dynamically removed.
Strike Microsoft Internet Explorer HTML Invalid Element Use After Free	CWE: 94 CVE: 2012-0011 BID: 51933	This strike exploits a denial of service vulnerability in Microsoft Internet Explorer when an invalid element is specified and assigned a fixed position, then given focus and subsequently has its position attribute altered.

Name	References	Description
Strike Microsoft SharePoint Server and Foundation 2010 and 2010 SP1 Cross Site Scripting Vulnerability	CWE: 79 CVE: 2012-0145	Microsoft Sharepoint Server and Foundation 2010 and 2010 SP1 contains a vulnerability in its "_layouts/Chart/WebUI/WizardList.aspx" page that can allow an attacker to inject his own code into the page via the "skey" URL parameter and perform a cross-site-scripting attack.
Strike Internet Explorer Col Span Heap Overflow	CWE: 94 CVE: 2012-1876	This strike exploits a heap overflow in Internet Explorer up to and including 10 on Windows 7.
Strike mshtml.dll toStaticHTML Cross Site Scripting	CWE: 200 CVE: 2012-1858	This strike exploits a quote mishandling vulnerability in mshtml.dll which allows to execute dynamic content in otherwise static HTML.
Strike MHTML Cross Site Scripting Vulnerability (image file delivery)	BID: 46055 CWE: 79 CVE: 2011-0096	A cross site scripting vulnerability has been identified in the processing of the MHTML protocol, that allows injection of arbitrary code with no special character requirements. This is an image file delivery where the MHTML is padded at the end of an image file. This does require another exploit to expose the image link in an mhtml format ( mhtml:http://uri/file.ext!action ), this is possible because the MHTML protocol handler ignores the file extension.
Strike Microsoft Video ActiveX Control msvidctl.dll Memory Corruption	CWE: 119 CVE: 2008-0015 BID: 35558	This strike exploits a vulnerability in the Microsoft MSVidCtl ActiveX control when processing a crafted .gif file. This attack has been seen in the wild.
Strike Microsoft Internet Explorer 6.0 Png pngfilt.dll ProcessTRNS() Null Pointer Dereference (HTTP)		Microsoft Internet Explorer 6.0 suffers from a null pointer dereference vulnerability in its parsing of tRNS chunks in a png. If the png is missing the IHDR chunk, a null pointer will be dereferenced leading to denial of service conditions.
Strike Microsoft Visual Studio .NET msdds.dll Remote Code Execution Variant 1	CWE: 119 CVE: 2005-2127 BID: 14594	This strike exploits a buffer overflow in a COM object installed with Microsoft Visual Studio .NET. This strike simulates downloading via HTTP an HTML file that triggers the overflow.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Visual Studio .NET msdds.dll Remote Code Execution Variant 2	CWE: 119 CVE: 2005-2127 BID: 14594	This strike exploits a buffer overflow in a COM object installed with Microsoft Visual Studio .NET. This strike simulates downloading via HTTP an HTML file that triggers the overflow.
Strike Microsoft Windows MSHTA Arbitrary Script Execution - HTTP Download	CVE: 2005-0063 BID: 13132	This strike exploits a flaw in Microsoft Windows that allows non-executable files to be executed. This strike simulates downloading a malicious via HTTP.
Strike Internet Explorer Uninitialized Data Source Memory Corruption	CWE: 94 CVE: 2011-0035 BID: 46157	This strike delivers a payload consistent with triggering a memory corruption flaw in Microsoft Internet Explorer versions 6, 7, and 8. The vulnerability is triggered when erroneously accessing an XML Data Source Object that has not been properly initialized or deleted. This vulnerability, when exploited successfully, may produce remote code execution conditions under the context of the logged-in user, by way of a maliciously crafted HTML document.
Strike Internet Explorer Uninitialized ActiveX Object Memory Corruption	CWE: 94 CVE: 2010-3340 BID: 45255	This strike delivers a payload consistent with triggering a memory corruption flaw in Microsoft Internet Explorer versions 6, 7, and 8. The vulnerability is triggered when erroneously accessing an ActiveX object (specifically an instantiation of the Pkmaxctl.VocabCtl control) that has not been properly initialized or deleted. This vulnerability, when exploited successfully, may produce remote code execution conditions under the context of the logged-in user, by way of a maliciously crafted HTML document.
Strike Internet Explorer Uninitialized HTML Object Memory Corruption	CWE: 94 CVE: 2010-3343	This strike delivers a payload consistent with triggering a memory corruption flaw in Microsoft Internet Explorer versions 6, as embedded in Microsoft Windows 2000, XP, and Server 2003. This vulnerability is triggered by a malicious HTML document crafted causing Internet Explorer to improperly process uninitialized CSS anim objects in memory which can lead to remote control of execution and potential arbitrary code execution. User interaction is required by way of leaving the page either by going to a new unique URL or by simply refreshing the page.
Strike Internet Explorer Uninitialized Object Memory Corruption	CWE: 94 CVE: 2011-0036 BID: 46158	This strike delivers a payload consistent with triggering a memory corruption flaw in Microsoft Internet Explorer versions 6, 7, and 8. The vulnerability is triggered when erroneously accessing an object that has not been properly initialized or deleted. This vulnerability, when exploited successfully, may produce remote code execution conditions under the context of the logged-in user, by way of a maliciously crafted HTML document.
Strike Multiple Browser Marquee Tag Denial of Service	CVE: 2006-2723 BID: 18165	This strike exploits a denial of service (memory corruption) vulnerability that can be used to crash multiple major vendors' web browsers by overflowing the marquee tag.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike MyNewsGroups layersmenu.inc.php myng_root Parameter PHP File Include	CWE: 94 CVE: 2006-3966 BID: 19258	This strike exploits a PHP include flaw in the MyNewsGroups web application.
Strike MySQL Commander dbopen.php home Parameter PHP File Include	BID: 22941 CVE: 2007-1439	This strike exploits a remote file include vulnerability in MySQL Commander
Strike SAP-MySQL MaxDB WebDBM Buffer Overflow	CVE: 2006-4305 BID: 19660	This strike exploits a remote buffer overflow in the SAP/MySQL MaxDB WebDBM management interface
Strike NCTSoft AudFile.dll SetFormatLikeSample ActiveX	BID: 22196 BID: 23892 CWE: 119 CVE: 2007-0018	This strike exploits a flaw in the NCTSoft AudFile.dll ActiveX control when calling the SetFormatLikeSample() function.
Strike IP3 NetAccess getFile.cgi Directory Traversal	CVE: 2007-0883 BID: 22513	This strike exploits a directory traversal flaw in the IP3 NetAccess web server using the getFile.cgi CGI script.
Strike Netscape-iPlanet Search NS-Query-Pat Traversal (Unix)	CVE: 2002-1042 BID: 5191	This strike exploits an directory traversal flaw in search engine provided with the Netscape and iPlanet web servers.
Strike Netscape-iPlanet Search NS-Query-Pat Traversal (Win32)	CVE: 2002-1042 BID: 5191	This strike exploits an directory traversal flaw in search engine provided with the Netscape and iPlanet web servers.
Strike Novell Messenger 2.1 Denial of Service	BID: 52056	This strike causes a denial of service in the Novell Messenger Messaging Agent. The vulnerability is due to failure to verify different data types when processing login messages.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike NoMoKeTos functions_nomoketos_rules.php phpbb_root_path Parameter PHP File Include	BID: 22713  CVE: 2007-1106	This strike exploits a remote PHP include flaw in the NoMoKeTos module.
Strike Novell GroupWise Messenger createsearch memory corruption		This strike exploits a memory corruption vulnerability within Novell GroupWise Messenger. The vulnerability is due to insufficient checking of the type value in the request. A remote attacker may take advantage of this vulnerability to execute the memory corruption attack on the target system.
Strike Novell GroupWise Messenger login memory corruption		This strike exploits a memory corruption vulnerability within Novell GroupWise Messenger. The vulnerability is due to insufficient input checking of the type value in the request. A remote attacker may take advantage of this vulnerability to execute the memory corruption attack on the target system.
Strike Novell GroupWise Messenger HTTP Response Handling Stack Buffer Overflow	CWE: 119  CVE: 2008-2703  BID: 29602	This strike exploits a stack-based buffer overflow present in Novell GroupWise Messenger (GWIM) Client before 2.0.3 HP1 for Windows which allows remote code execution by way of "spoofed server responses" that contain a long string after the NM_A_SZ_TRANSACTION_ID field name.
Strike Novell iPrint Client ActiveX control memory corruption	CWE: 119  CVE: 2011-4185	This strike exploits a memory corruption vulnerability inside the GetPrinterURLList2 function of Novell's iPrint ActiveX control. A user supplied object string rcvs a length validation, and if it is >=512 bytes or the contextName >= 2048 bytes the check fails. The application then proceeds to write stack memory to a different function, which results in invalid memory access.
Strike Novell NetMail WebAdmin Buffer Overflow	BID: 22857  CVE: 2007-1350	This strike exploits a remote stack overflow in the Novell NetMail WebAdmin component's HTTP interface by providing an overly-long Basic Authentication username.
Strike Novell ZENworks Mobile Management Cross-Site Scripting (XSS) Vulnerability		This strike exploits a cross-site scripting (XSS) vulnerability in Novell ZENworks Mobile Management. The vulnerability is due to improper validation while processing HTTP requests with username and domain parameters. An attacker could exploit this vulnerability in order to run malicious scripts on the target machine.
Strike Nullsoft Shoutcast Server Request Log Cross-Site Scripting	CWE: 79  CVE: 2007-1229  BID: 22742	This strike exploits a cross-site scripting vulnerability in the Nullsoft Shoutcast log viewer web interface

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike OABOARD Web Forum forum.php inc Parameter PHP File Include	CVE: 2006-0076  BID: 16105	This strike exploits a PHP include flaw in the OABoard Forum.
Strike Alcatel OmniPCX Office FastJSData.cgi id2 Parameter Command Execution	CWE: 20  CVE: 2008-1331  BID: 28758	This strike exploits an arbitrary command execution flaw the Alcatel OmniPCX Office web interface. This flaw can be triggered by inserting shell metacharacters into the id1 or id2 parameters of the FastJSData.cgi web application.
Strike Alcatel OmniPCX Office MasterCGI user Parameter Command Execution	CWE: 20  CVE: 2007-3010  BID: 25694	This strike exploits an arbitrary command execution flaw the Alcatel OmniPCX Office web interface. This flaw can be triggered by inserting shell metacharacters into the user parameter of the MasterCGI web application.
Strike Open Educational System CONF_CONFIG_PAT H Parameter PHP File Include Vulnerability	BID: 22858  CVE: 2007-1372	This strike exploits a remote file include vulnerability in Open Educational System
Strike OPENi-CMS Plugin index.php oi_dir Parameter PHP File Include	CVE: 2007-0881  BID: 22511	This strike exploits a PHP include flaw in the OPENi-CMS web application.
Strike OpenView connectedNodes.ov pl node Parameter Command Execution	BID: 14662  CVE: 2005-2773	This strike exploits an arbitrary command execution flaw the OpenView connectedNodes.ovpl CGI application.
Strike Opera JavaScript Alert() Buffer Overflow		This strike exploits a flaw in Opera 10.10 in which overly long values given to the JavaScript Alert() function can cause the browser to crash
Strike Opera 10.53 JavaScript getImageData() Memory Corruption DoS		This strike exploits a flaw in Opera 10.53 in which a malformed call to the JavaScript getImageData() function can cause the browser to crash.
Strike Opera SVG Animation Element Denial of Service		This strike exploits a flaw in the way Opera v10.63 handles malformed SVG animation elements which results in the browser window crashing.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle Application Server BPEL Module Linked XSS	CVE: 2008-4014 BID: 33177	This strike exploits a cross-site scripting vulnerability in the Oracle Application Server BPEL Module. An attacker may append a persistent, malicious script fragment to the end of a normal URL request.
Strike Oracle Data Quality LoaderWizard Type Confusion		This strike exploits an Oracle Data Quality LoaderWizard vulnerability which is due to absence of input validation in the DataPreview method. An attacker could exploit this vulnerability in order to remotely execute malicious code.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 2	CWE: 287  CVE: 2002-0563  BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 11	CWE: 287  CVE: 2002-0563  BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 12	CWE: 287  CVE: 2002-0563  BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 3	CWE: 287  CVE: 2002-0563  BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 4	CWE: 287  CVE: 2002-0563  BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 5	CWE: 287 CVE: 2002-0563 BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 6	CWE: 287 CVE: 2002-0563 BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 7	CWE: 287 CVE: 2002-0563 BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 8	CWE: 287 CVE: 2002-0563 BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle 9iAS Dynamic Monitoring Services Anonymous Access Variant 10	CWE: 287 CVE: 2002-0563 BID: 4293	This strike exploits a default configuration flaw in the Oracle 9i Application Server version 1.0.2.x.
Strike Oracle FlashTunnelService Deletion of Arbitrary Files		This strike exploits a vulnerability in Oracle's Business Transaction Management FlashTunnelService where an arbitrary file may be deleted from the system. Note that this service may be configured to run on different ports.
Strike Oracle GlassFish Directory Traversal		This strike exploits a directory traversal vulnerability in Oracle GlassFish 4.1 and prior versions. The vulnerability can be exploited by issuing a crafted HTTP GET request utilizing a %C0%2F instead of (/), URL encoding. The vulnerability allows attackers to read arbitrary files on the server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Oracle HTTP Server username XSS Vulnerability	BID: 9484 CVE: 2004-2115	This strike exploits an XSS vulnerability in the Oracle HTTP Server (based on Apache)
Strike Oracle HTTP Server password XSS Vulnerability	BID: 9484 CVE: 2004-2115	This strike exploits an XSS vulnerability in the Oracle HTTP Server (based on Apache)
Strike Oracle HTTP Server action XSS Vulnerability	BID: 9484 CVE: 2004-2115	This strike exploits an XSS vulnerability in the Oracle HTTP Server (based on Apache)
Strike Oracle Java 5,6,7 ZipFile readCEN Denial of Service	BID: 52013 CVE: 2012-0501	This strike exploits an denial of service vulnerability in Oracle Java. The vulnerability is due to a recursion error in the Oracle Java ZipFile class when a malicious zipfile is processed.
Strike Oracle VM ovs-agent XML-RPC Remote Command Injection	CVE: 2010-3582 BID: 44031	This strike exploits an input sanitization flaw in the XML-RPC interface of the Oracle Virtual Server Agent. The flaw exists in the utl_test_url function and allows an attacker to execute arbitrary commands on the server.
Strike Oracle Secure Backup exec_qr() \$ora_osb_bgcookie Command Execution	CVE: 2008-5448 BID: 33177	This strike sends a command execution attack leveraging an unsanitized variable used by Oracle Secure Backup's exec_qr() function.
Strike Oracle Secure Backup exec_qr() \$ora_osb_lcookie Command Execution	CVE: 2008-5448 BID: 33177	This strike sends a command execution attack leveraging an unsanitized variable used by Oracle Secure Backup's exec_qr() function.
Strike Oracle Secure Backups exec_qr() \$rbtool Command Execution	CVE: 2008-5448 BID: 33177	This strike sends a command execution attack leveraging an unsanitized variable used by Oracle Secure Backup's exec_qr() function.
Strike Oracle TimesTen Data Server Log Format String	CVE: 2008-5440 BID: 33177	This strike exploits a format string vulnerability Oracle Database 7.0.5's TimesTen Data Server. An attacker may send a format string to the event viewer, causing the component to either crash or execute malicious code.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike osCommerce 2.3.4.1 - Remote Code Execution	EXPLOITDB : 44374	This strike exploits a code execution vulnerability in osCommerce 2.3.4.1. This vulnerability is due to improper sanitization of the HTTP data when the client sends http traffic to the server. A remote attacker can trigger this vulnerability by sending a malicious request to the web interface. This results in the ability to execute system commands on the target device.
Strike ManageEngine DesktopCentral AgentLogUpload Arbitrary File Upload	BID: 63784 CVE: 2013-7390	This strike exploits a vulnerability in ManageEngine DesktopCentral software suite. Due to improper authorization, a remote authenticated attacker may upload an arbitrary files through the AgentLogUpload servlet. All versions of the software prior to 8.0.0 build 80293 are vulnerable.
Strike Mozilla Firefox xul.dll Large Window Handling Null Pointer Deference DOS Weakness	BID: 67501	This strike exploits a vulnerability inside the Mozilla Firefox Web Browser. Specifically, it targets a flaw in how the xul.dll library handles overly large windows. If a user accesses a specially crafted page, an application crash may be triggered leading to a DOS condition. All versions of Firefox prior to 29.0.1 are vulnerable to this attack.
Strike SolarWinds Storage Manager AuthenticationFilter Authentication Bypass	BID: 69438	This strike exploits a vulnerability inside SolarWinds Storage Manager which allows bypass of authentication filters. This in turn can lead to arbitrary file upload and code execution on the target server.
Strike ActualScript ActualAnalyzer aa.php Cookie Command Execution		This strike exploits a command execution vulnerability in ActualScript ActualAnalyzer. An HTTP request with a specially crafted cookie value can be used to execute arbitrary commands with user privileges on the target machine.
Strike Wordpress MailChimp Subscribe Forms PHP Code execution		This strike exploits a PHP code execution vulnerability in Wordpress plugin MailChimp Subscribe Form. The vulnerability is due to insufficient validation of sm_email and sm_name HTTP request parameters. A malicious attacker can exploit this by inserting PHP code to the parameters in HTTP requests.
Strike WebUI mainfile.php arbitrary command injection		This strike exploits a command injection vulnerability in WebUI. The vulnerability is due to improper validation of user supplied data in mainfile.php. By exploiting this vulnerability, an unauthenticated attacker can execute arbitrary code on the target system.
Strike ManageEngine Desktop Central MSP FileUploadServlet arbitrary file upload		This strike exploits a file upload vulnerability in multiple ManageEngine products. The vulnerability is due to improper sanitization of user supplied HTTP parameters in FileUploadServlet. An unauthenticated attacker can exploit this vulnerability by sending a specially crafted HTTP request to the vulnerable server leading to arbitrary code execution.
Strike ManageEngine Applications Manager CommonAPIUtil SyncMonitors SQL Injection		This strike exploits an SQL injection vulnerability in ManageEngine Application Manager. The vulnerability is due to improper validation of user supplied input in the SyncMonitors method. An unauthenticated attacker can exploit this vulnerability by sending crafted HTTP requests to the vulnerable server.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Internet Explorer CTxtPtr moveEnd Negative Value Memory Access		This strike exploits a memory access vulnerability in Microsoft Internet Explorer. A TextRange element in the DOM tree of a specially crafted HTML page can be manipulated in such a way as to trigger memory reading outside the defined buffer. Successful exploitation can result in disclosure of random heap data or abnormal termination of Internet Explorer.
Strike Sybase M-Business Anywhere agSoap.exe Closing Tag Buffer Overflow	BID: 47775	This strike exploits a heap buffer overflow vulnerability in Sybase M-Business Anywhere. The vulnerability is due to insufficient validation of SOAP requests sent to the service interface. By specially crafting a malicious SOAP request, an unauthenticated attacker could execute arbitrary commands on the server.
Strike CA Total Defense Suite UNC Management SQL Injection		This strike exploits a SQL injection vulnerability within CA Total Defense Suite. This vulnerability is due to improper sanitation of parameters in a procedure. A remote attacker can take advantage of this vulnerability to inject SQL commands.
Strike EGallery PHP File Upload Vulnerability	BID: 54464	This strike exploits a vulnerability in EGallery. The vulnerability allows unauthenticated file uploads which can result in arbitrary code execution.
Strike Sinapsi eSolar Light Photovoltaic System Monitor Command Injection	BID: 55872  CWE: 264  CVE: 2012-5863	This strike exploits a command injection vulnerability in Sinapsi eSolar Light Photovoltaic System Monitor.
Strike D-Link DIR-605L Captcha Handling Buffer Overflow	BID: 56330	This strike exploits a buffer overflow vulnerability inside D-Link DIR-605L devices that can lead to remote code execution. The vulnerability is present inside the FILECODE parameter sent through http requests.
Strike D-Link Devices Command.php Unauthenticated Remote Command Execution	BID: 57734	This strike exploits an unauthenticated remote command execution vulnerability that is present on several D-Link devices. The attack is performed through the command.php script.
Strike SAP NetWeaver Portal ConfigServlet Remote Command Execution		This strike exploits a vulnerability in SAP NetWeaver Portal, more specifically how input is handled by the ConfigServlet. Due to improper authorization, a remote unauthenticated attacker may execute system commands using the system privileges associated with the NetWeaver process. All versions of the software prior to 7.01 are vulnerable.
Strike HP LaserJet Pro Webadmin Password reset		This strike exploits a vulnerability in the HP LaserJet Pro printer. Due to improper validations a remote attacker may change the password of a webadmin to an arbitrary value. The P1606dn model printers are vulnerable to this attack.
Strike PineApp Mail-SeCure livelog.html Multiple Command Execution		This strike exploits an arbitrary command execution vulnerability in PineApp Mail-SeCure. A specially crafted HTTP request can be sent to livelog.html to execute arbitrary commands with root privileges.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike PineApp Mail-SeCure conflivelog.pl Command Execution		This strike exploits an arbitrary code execution vulnerability in PineApp Mail-SeCure. A specially crafted HTTP request can be sent to conflivelog.pl to execute arbitrary commands with privileges of the qmailq user.
Strike PineApp Mail-SeCure test_li_connection.php iptest Command Execution	CWE: 94 CVE: 2013-6829	This strike exploits an arbitrary code execution vulnerability in PineApp Mail-SeCure. A specially crafted HTTP request can be sent to test_li_connection.php to execute arbitrary commands with root privileges.
Strike PineApp Mail-SeCure confpremenu.php export logs Command Execution		This strike exploits an arbitrary code execution vulnerability in PineApp Mail-SeCure. A specially crafted HTTP request can be sent to confpremenu.php to execute arbitrary commands with privileges of the qmailq user.
Strike PineApp Mail-SeCure confpremenu.php Command Execution		This strike exploits an arbitrary code execution vulnerability in PineApp Mail-SeCure. A specially crafted HTTP request can be sent to confpremenu.php to execute arbitrary commands with privileges of the qmailq user.
Strike Mitsubishi MCWorkX ActiveX Control File Execution	CWE: 94 CVE: 2013-2817 BID: 62414	This strike exploits a Mitsubishi MCWorkX ActiveX control code execution vulnerability which is due to no confirmation when executing the command in the ActiveX control. Remote attackers may do arbitrary file creation on the target system.
Strike Nagios Core Config Manager tfPassword SQL Injection		This strike exploits an authentication bypass vulnerability that is accessible via SQL injection inside of Nagios Config Manager
Strike Apple OS X CFNetwork HTTP 302 Status Denial of Service	BID: 22249  BID: 26444  CWE: 119  CVE: 2007-0464	Apple's Mac OS X Core Foundation is vulnerable to a denial of service in CFNetwork when processing HTTP 302 and 301 messages with a non-existent Location: header.
Strike Mac OS X Finder DMG Volume Name Memory Corruption (HTTP)	BID: 21980  CWE: 119  CVE: 2007-0197	This transfers a malicious disk image (DMG) file to a Mac OS X target.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Flip4Mac Memory Corruption (HTTP)	BID: 22286 CVE: 2007-0466	This strike exploits a memory corruption flaw in Telestream Flip4Mac when handling WMF files.
Strike Apple OS X QuickDraw GetSrcBits32ARGB Memory Corruption Denial of Service (HTTP)	BID: 22207 CVE: 2007-0462	This strike exploits a denial of service condition in Apple's Mac OS X when opening a malformed PICT file.
Strike Apple OS X Safari Format String	CVE: 2007-0644 BID: 22326	Safari on Apple's Mac OS X is vulnerable to a format string vulnerability in a call to window.console.log().
Strike Mac OS X Safari x-man-page URI Terminal Escape Command Execution	CVE: 2005-1342 BID: 13502	This strike exploits a flaw in the x-man-page URI handler in the Safari web browser.
Strike PDF Launch Action Feature Adobe Fix Bypass (HTTP)	CWE: 264 CVE: 2010-1240 BID: 39109	This strike bypasses the fix Adobe made for the original PDF Launch Action vuln ( <a href="http://blog.didierstevens.com/2010/03/29/escape-from-pdf/">http://blog.didierstevens.com/2010/03/29/escape-from-pdf/</a> , strikeids E10-3yg00 - E10-3yg07.) Adobe's fix maintained a blocklist of dangerous extensions in the registry (.exe, .bat, etc.) This is bypassed by adding one or two sets of double quotes around the file, which adds one or two quotes onto the end of the parsed extension (.exe != .exe "")
Strike PDF Launch Action Feature (HTTP)	CWE: 264 CVE: 2010-1240	The PDF file format has a feature that allows an external program to be run (the "/Launch" action). An attacker can create a PDF that makes use of this feature to execute programs on the client's computer.
Strike Pegasus Imaging ImagXpress ActiveX File Delete	CWE: 22 CVE: 2007-5320 BID: 25949	This strike exploits an ActiveX bug in Pegasus Imaging ImagXpress that allows arbitrary files to be deleted.
Strike Pegasus Imaging ImagXpress ActiveX File Overwrite	CWE: 22 CVE: 2007-5320 BID: 25948	This strike exploits an ActiveX bug in Pegasus Imaging ImagXpress that allows arbitrary files to be overwritten.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike ESF pfSense 2.2.6 Command Injection	EXPLOITDB : 39709	This strike exploits a vulnerability in ESF pfSense 2.2.6. Specifically, status_rrd_graph_img.php does not properly validate the graph parameter. Certain characters are able to escape the filter and allow for a shell command to be built and executed. This is an authenticated attack, however, a remote attacker could leverage a CSRF vulnerability by enticing an authenticated victim to execute this code allowing for command execution with that user's current privileges.
Strike PHF Qname Parameter Command Execution	BID: 629 CVE: 1999-0067	This strike exploits an arbitrary command execution flaw the 'phf CGI application.
Strike Philboard philboard_forum.asp forumid Parameter SQL Injection	CVE: 2007-0920 BID: 22532	This strike exploits a SQL injection flaw in the Philboard web application.
Strike Phorecast index.php include Parameter PHP File Include	CVE: 2001-1049 BID: 3388	This strike exploits a PHP include flaw in the Phorecast web application.
Strike Phorecast index.php include dir Parameter PHP File Include	CVE: 2001-1049 BID: 3388	This strike exploits a PHP include flaw in the Phorecast web application.
Strike Phormation PHP Library index.php include Parameter PHP File Include	CVE: 2001-1237 BID: 3393	This strike exploits a PHP include flaw in the Phormation PHP Library.
Strike PHP5 Hash Collision Denial Of Service	CWE: 20 CVE: 2011-4885 BID: 51193	This strike exploits a denial of service bug in PHP5 when parameters have the same internal hash.
Strike phpSecurePages secure.php cfgProgDir Parameter PHP File Include	CVE: 2001-1468 BID: 2970	This strike exploits a PHP include flaw in the phpSecurePages web authentication application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike PHP5 php_register_variable_ex Buffer Overflow	CWE: 399  CVE: 2012-0830  BID: 51830	This strike exploits a denial of service bug in PHP 5.3.9 and any back-patched versions, that was introduced as a fix for CVE-2011-4885. It exploits an error condition in php_register_variable_ex when the number of post variables exceeds max_input_vars.
Strike PHPAuction view.inc.php phpAds_path Parameter PHP File Include	CVE: 2006-3984  BID: 19254	This strike exploits a PHP remote file include flaw in PHPAuction.
Strike PHP DateTimeZone Object Unserialize Type Confusion		This strike exploits a vulnerability in PHP which is triggered when trying to deserialize a serialized DateTimeZone object. The vulnerability can be exploited through user supplied parameters which are then passed to the vulnerable function. If exploited the vulnerability can result in remote code execution under the context of the service running the PHP server.
Strike PHP Exif Integer Overflow Denial of Service	CWE: 189  CVE: 2011-4566  BID: 50907	This strike targets a vulnerability in the PHP Exif metadata parser. The vulnerability is due to failure to account for integer overflow when parsing Image File Directory (IFD) entries. If the target system is configured to automatically parse uploaded image files, an unauthenticated attacker could upload a malicious file in order to trigger a Denial of Service condition.
Strike PHP Generic MembreManager.php include_path Parameter PHP File Include	CVE: 2007-0584  BID: 22287	This strike exploits a PHP remote file include vulnerability in the PHP Generic MembreManager web application.
Strike PHP Nuke Blind SQL Injection	BID: 22638  CVE: 2007-1061	This strike exploits a blind SQL injection vulnerability in the PHP Nuke CMS
Strike PHP POST File Upload PHP GLOBALS Variable Overwrite	CVE: 2005-3390  BID: 15250	This strike exploits a vulnerability in PHP which allows an attacker to overwrite the PHP \$GLOBALS variable when performing a POST operation with a multipart/form-data request.
Strike PHP POST File Upload Overflow	CVE: 2002-0081  BID: 4183	This strike exploits a remote heap overflow in the PHP programming language function php_mime_split.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike PHP zip --URL Wrapper Buffer Overflow (HTTP)	CVE: 2007-1339  BID: 22883	This strike exploits a buffer overflow in the 'zip://' protocol handler of PHP's fopen and similar functions
Strike PHP Ads new helperfunction.php include Parameter PHP File Include	CVE: 2001-1054  BID: 3392	This strike exploits a PHP include flaw in the PHPAdsNew web application.
Strike PHP Ads new helperfunction.php include_dir Parameter PHP File Include	CVE: 2001-1054  BID: 3392	This strike exploits a PHP include flaw in the PHPAdsNew web application.
Strike phpBB highlight Parameter Remote Code Execution Variant 1	CVE: 2005-2086  CVE: 2004-1315  BID: 14086  BID: 10701	This strike exploits a command execution flaw in phpBB, a web forums application.
Strike phpBB highlight Parameter Remote Code Execution Variant 2	CVE: 2005-2086  CVE: 2004-1315  BID: 14086  BID: 10701	This strike exploits a command execution flaw in phpBB, a web forums application.
Strike PHPenpals profile.php personalID Parameter SQL Injection	CWE: 89  CVE: 2006-0074  BID: 16109	This strike exploits a SQL injection flaw in the Jevontech PHPenpals script.
Strike phpFileManager Command Execution Vulnerability Through cmd Parameter	EXPLOITDB : 37709	This strike exploits a remote command execution vulnerability in phpFileManager. The vulnerability is due to improper filtering of HTTP cmd and action parameters. An attacker could exploit this vulnerability in order get code execution on the target machine.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike PHPLiveHelper global.php abs_path Parameter PHP File Include	CVE: 2006-4051  BID: 19349	This strike exploits a PHP include flaw in the PHP Live Helper web application (global.php).
Strike PHP Live Helper help.php css_path Parameter PHP File Include	BID: 19116	This strike exploits a PHP include flaw in the Live Helper web application.
Strike phpMyAdmin sql.php goto Parameter PHP File Include	CVE: 2001-0478  BID: 2642	This strike exploits a PHP include vulnerability in phpMyAdmin 2.1.0.
Strike phpMyAdmin tbl_replace.php goto Parameter PHP File Include	CVE: 2001-0478  BID: 2642	This strike exploits a PHP include vulnerability in phpMyAdmin 2.1.0.
Strike PHPSimpleShop index.php abs_path Parameter PHP File Include	CVE: 2006-4052  BID: 19382	This strike exploits a PHP include flaw in the PHP Simple Shop web application (admin/index.php).
Strike PHPSimpleShop adminindex.php abs_path Parameter PHP File Include	CVE: 2006-4052  BID: 19382	This strike exploits a PHP include flaw in the PHP Simple Shop web application (admin/adminindex.php).
Strike PHPSimpleShop adminglobal.php abs_path Parameter PHP File Include	CVE: 2006-4052  BID: 19382	This strike exploits a PHP include flaw in the PHP Simple Shop web application (admin/adminglobal.php).
Strike PHPSimpleShop login.php abs_path Parameter PHP File Include	CVE: 2006-4052  BID: 19382	This strike exploits a PHP include flaw in the PHP Simple Shop web application (admin/login.php).
Strike PHPSimpleShop menu.php abs_path Parameter PHP File Include	CVE: 2006-4052  BID: 19382	This strike exploits a PHP include flaw in the PHP Simple Shop web application (admin/menu.php).

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike PHPSimpleShop header.php abs_path Parameter PHP File Include	CVE: 2006-4052  BID: 19382	This strike exploits a PHP include flaw in the PHP Simple Shop web application (admin/header.php).
Strike PollMentor pollmentorres.asp id Parameter SQL Injection	BID: 22542  CWE: 89  CVE: 2007-0984	This strike exploits an SQL injection vulnerability in PollMentor 2.0
Strike Microsoft Powerpoint 2003 Heap Overflow (HTTP)		This strike exploits a heap overflow vulnerability in Microsoft Office 2005 Powerpoint
Strike pSlash Web Portal index.php include_dir Parameter PHP File Include	CVE: 2001-1235  BID: 3395	This strike exploits a PHP include flaw in the pSlash web portal application.
Strike Apple QTJava toQTPointer() Arbitrary Memory Access (QTBurn)	CVE: 2007-2175  BID: 23608	This strike exploits an arbitrary memory access vulnerability in the QTJava library using a malicious Java applet.
Strike Quicktime rstp --Handler Buffer Overflow	CVE: 2007-0015  BID: 21829	This strike exploits a buffer overflow vulnerability in Apple Quicktime. This exploit simulates a download of the exploit over HTTP on port 80.
Strike Apple Quicktime SMIL Integer Overflow Exploit	CVE: 2007-2394  BID: 24873	This strike exploits a flaw in Quicktime's handing of invalid SMIL files when loaded in a browser.
Strike raSMP index.php record_hit() Function User-Agent XSS	CVE: 2006-0084  BID: 16138	This strike exploits a cross site scripting flaw in the raSMP web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike RealPlayer rmoc3260.dll ActiveX Control Remote Code Execution	CWE: 399 CVE: 2008-1309 BID: 28157	This strike exploits a code execution vulnerability in the RealPlayer rmoc3260.dll ActiveX control.
Strike Redaxo CMS Addon MyEvents 2.2.1 - SQL Injection	EXPLOITDB : 44261	This strike exploits a SQL injection vulnerability in the Redaxo CMS Addon MyEvents. This vulnerability is due to improper sanitization for the parameter "myevents_id". A remote attacker can access backend contents with successful exploitation.
Strike Microsoft IIS RSA SecurID Web Agent Overflow	CVE: 2005-1471 BID: 13524	This strike exploits a heap overflow bug in the RSA SecurID Web Agent which runs on IIS.
Strike Sabdrimer advanced1.php pluginpath[0] Parameter CMS PHP File Include	CVE: 2006-3520 BID: 18907	This strike exploits a PHP include flaw in the Sabdrimer CMS web application.
Strike Safari iframe Remote Code Execution-Denial of Service	CWE: 20 CVE: 2011-5046 BID: 51122	This strike exploits a memory corruption vulnerability in Windows 7 x64 win32k.sys via Apple Safari. Other Webkit browsers may be vulnerable too. The flaw occurs when handling crafted height values for OS skinned elements, such as iframes and buttons.
Strike Safari Use-After-Free Parent.Close() Vulnerability	CWE: 399 CVE: 2010-1939 BID: 39990	Safari 4.0.5 and 4.0.4 are vulnerable to a use-after-free exploit that can lead to code execution. Other versions (4.0.X versions prior to 4.0.4) are at least susceptible to denial of service attacks via the same vector. The vulnerability is triggered when a child window stores a reference to its parent, attempts to close the parent, and then tries to access a property/call a function on the parent.
Strike Safari XSLT Arbitrary File Creation	CWE: 20 CVE: 2011-1774 BID: 48840	This strike an arbitrary file creation in Safari due to a specially crafted XSLT transformation. Versions prior to 5.0.6 are affected.
Strike Best Software SalesLogix Authentication Bypass	CVE: 2004-1612 BID: 11450	This strike sends a malicious cookie value that will cause the SalesLogix software to admit administrator access

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Best Software SalesLogix view id Parameter SQL Injection	CVE: 2004-1612 BID: 11450	This strike exploits an SQL injection vulnerability in SalesLogix
Strike Samsung SmartViewer CNC_Ctrl ActiveX Control Remote Code Execution	BID: 77084 CWE: 20 CVE: 2015-8040	This strike exploits an out of bounds indexing vulnerability in Samsung SmartViewer CNC_Ctrl ActiveX. The flaw is due to insufficient validation of input to the rtsp_getdlsendtime method by the CNC_Ctrl ActiveX control. By enticing a user to visit a malicious web page, arbitrary code can be executed on the client system.
Strike SAP GUI TabOne Caption Buffer Overflow	CWE: 119 CVE: 2008-4827 BID: 33148	This strike exploits a buffer overflow vulnerability present in the SizerOne ActiveX library loaded by the SAP GUI. Due to an issue involving improper bounds-checking, a malicious web page can cause the AddTab function to generate a tab caption that is too large for the buffer to hold, leading to system instability and the possibility of remote code execution.
Strike SAP Internet Transaction Server Directory Traversal	CVE: 2003-0748 BID: 8516	This strike exploits an directory traversal flaw in the SAP Internet Transaction Server.
Strike SAP Internet Transaction Server wgate.dll ~service Parameter XSS	CVE: 2003-0749 BID: 8517	This strike exploits a cross-site scripting flaw in the SAP Internet Transaction Server
Strike SAP Message Server Server Group Parameter Overflow	CVE: 2007-3624 BID: 24765	This strike exploits a buffer overflow in the SAP Message Server.
Strike SaPHPLesson add.php forumid Parameter SQL Injection	CVE: 2006-2835 BID: 18934	This strike exploits an SQL injection flaw in the SaPHPLesson web application.
Strike SaPHPLesson show.php lessid Parameter SQL Injection	CVE: 2006-2835 BID: 18934	This strike exploits an SQL injection flaw in the SaPHPLesson web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SaveWeb Portal 3.4 menu_dx.php SITE_Path Parameter PHP File Include	CVE: 2005-2687 CVE: 2006-4012 BID: 19306	This strike exploits a PHP remote file include flaw in the SaveWeb Portal 3.4 web application (menu_dx.php).
Strike SaveWeb Portal 3.4 poll.php SITE_Path Parameter PHP File Include	CVE: 2005-2687 CVE: 2006-4012 BID: 19306	This strike exploits a PHP remote file include flaw in the SaveWeb Portal 3.4 web application (poll.php).
Strike SaveWeb Portal 3.4 view_polls.php SITE_Path Parameter PHP File Include	CVE: 2005-2687 CVE: 2006-4012 BID: 19306	This strike exploits a PHP remote file include flaw in the SaveWeb Portal 3.4 web application (view_polls.php).
Strike ScozBook auth.php adminname Parameter SQL Injection	CVE: 2006-0079 BID: 16115	This strike exploits a SQL injection flaw in the ScozBook web application.
Strike Serendipity Unauthenticated SQL Injection	CVE: 2007-1326 BID: 22774	This strike exploits an SQL injection vulnerability in the Serendipity Weblog package
Strike Microsoft IIS ServerVariables_JScript.asp Information Disclosure		This strike attempts to access a sample script included with IIS 4.0 that is vulnerable to a physical path disclosure issue.
Strike Microsoft Sharepoint 2007 Path Info XSS	BID: 23832 CWE: 79 CVE: 2007-2581	This strike triggers a cross-site scripting vulnerability in the Microsoft Sharepoint 2007 web service.

Name	References	Description
Strike Windows Shortcut Font Name Overflow (HTTP)	CVE: 2005-2118 CVE: 2005-0550 BID: 15070 BID: 13115	This strike exploits two different vulnerabilities in the Windows operating system. The first flaw triggers a stack overflow in the CSRSS process when a malformed shortcut is opened. The second flaw triggers a stack overflow in Windows Explorer when the properties of a malformed shortcut file are viewed.
Strike Site-Assistant menu.php paths[version] Parameter PHP File Include	CVE: 2007-0867 BID: 22467	This strike exploits a PHP include flaw in the Site-Assistant web application.
Strike Skype URI Handler Input Validation Vulnerability	BID: 38699	This strike exploits a vulnerability in the way Skype parses skype-protocol urls, such as skype:user123?call. The vulnerability allows an attacker to pass additional command-line arguments to the Skype executable, which may force the user to persist his/her credentials in a remote location, such as an UNC share.
Strike Microsoft Office Smart Tag Code Execution (http) Variant 1	BID: 18037 CVE: 2006-2492	This strike exploits an arbitrary code execution flaw in Microsoft Office, using the "Smart Tag" feature.
Strike Microsoft Office Smart Tag Code Execution (http) Variant 2	BID: 18037 CVE: 2006-2492	This strike exploits an arbitrary code execution flaw in Microsoft Office, using the "Smart Tag" feature.
Strike SMF Forum smf.php mosConfig_absolute_path Parameter PHP File Include	CWE: 94 CVE: 2006-3773 BID: 18924	This strike exploits a PHP include flaw in the Mambo SMF Forum web application.
Strike SolusLabs SolusVM centralbackup.php SQL injection arbitrary command execution		This strike exploits a SQL injection vulnerability with arbitrary command execution in SolusVM. A specially crafted POST request can be sent to an active VM, resulting in arbitrary command execution.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SQuery ase.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery halo.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery hlife.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery hlife2.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery igi2.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery main.lib.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery netpanzer.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SQuery old_hlife.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery pkill.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery q2a.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery q3a.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery devi.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery qworld.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery rene.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SQuery rvbshld.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery savage.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery simracer.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery sof1.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery sof2.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery unreal.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery ut2004.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike SQuery vietcong.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery doom3.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery armygame.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1610  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery et.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery flashpoint.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery gameSpy.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery gameSpy2.php libpath Parameter PHP File Include	CWE: 94  CVE: 2006-1688  BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.

Name	References	Description
Strike SQuery gore.php libpath Parameter PHP File Include	CWE: 94 CVE: 2006-1688 BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike SQuery gsvari.php libpath Parameter PHP File Include	CWE: 94 CVE: 2006-1688 BID: 17434	This strike exploits a PHP include flaw in the SQuery web application.
Strike Squid HTTP header buffer overflow	CWE: 119 CVE: 2013-4115 BID: 61111	This strike exploits a buffer overflow vulnerability in Squid. This vulnerability is due to improper handle large header in HTTP request.
Strike Sun Java System Web Server 7.0u7 Digest Auth Heap Overflow		This strike exploits a heap overflow in the Auth Digest field of the Sun Java web server.
Strike Sun Java Web Start dnsResolve ActiveX Buffer Overflow	CWE: 119 CVE: 2007-5019 BID: 25734	This strike exploits a buffer overflow vulnerability present in the isInstalled.dnsResolve ActiveX method installed with Sun Java's Web Start.
Strike NetWin SurgeMail Webmail Server page Parameter Format String	CWE: 134 CVE: 2008-1055 BID: 27990	This strike simulates a format string attack against the NetWin SurgeMail webmail server.
Strike ThemeREX Addons WordPress Plugin Remote Code Execution		A remote code execution vulnerability exists in ThemeREX Addons WordPress Plugin versions greater than 1.6.50, due to lack of sanitization for user-supplied data. By sending a crafted REST-API request to '/wp-json/trx_addons/v2/get/sc_layout', a remote unauthenticated user may invoke arbitrary PHP functions via 'sc' parameter.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike TheWebForum login.php username Parameter SQL Injection	CVE: 2006-0135 BID: 16161	This strike exploits a SQL injection flaw in the TheWebForum web application.
Strike TheWebForum register.php www Parameter XSS	CVE: 2006-0134 BID: 16161	This strike exploits a cross site scripting flaw in the TheWebForum web application.
Strike ThinkPHP Remote Code Execution	EXPLOITDB : 45978	This strike exploits a remote code execution in ThinkPHP framework. The flaw is rooted within the 'invokefunction' method as a consequence of no parameter validation. A remote, unauthenticated attacker may thus be able to execute code on the vulnerable machine with the permissions of the user running the web server.
Strike Microsoft IIS DLL Tilde Request Variant 1	CWE: 20 CVE: 2005-4360 BID: 15921	This strike attempts to crash IIS 5.1 by sending a malformed request.
Strike Microsoft IIS DLL Tilde Request Variant 2	CWE: 20 CVE: 2005-4360 BID: 15921	This strike attempts to crash IIS 5.1 by sending a malformed request.
Strike Microsoft IIS DLL Tilde Request Variant 3	CWE: 20 CVE: 2005-4360 BID: 15921	This strike attempts to crash IIS 5.1 by sending a malformed request.
Strike Microsoft IIS DLL Tilde Request Variant 4	CWE: 20 CVE: 2005-4360 BID: 15921	This strike attempts to crash IIS 5.1 by sending a malformed request.
Strike TinyPHPForum action.php txt Parameter XSS	CVE: 2006-0102	This strike exploits a cross site scripting flaw in the TinyPHPForum web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Trend Micro ObjectRemoveCtrl Server Method ActiveX	BID: 30407 CWE: 119 CVE: 2008-3364	This strike simulates an attack against Trend Micro OfficeScan. OfficeScanRemoveCtrl.dll is vulnerable to memory corruption when setting the Server attribute.
Strike TSEP colorsswitch.php tsep_config[absPath] Parameter PHP File Include	CVE: 2006-4055 BID: 19326	This strike exploits a PHP remote file include flaw in The Search Engine Project TSEP web application.
Strike Tumbleweed SecureTransport FileTransfer ActiveX Stack Overflow	CWE: 119 CVE: 2008-1724 BID: 28662	This strike exploits a flaw in the Tumbleweed SecureTransport FileTransfer ActiveX caused by improper checks on the "remoteFile" parameter of the "TransferFile" method.
Strike Ultimate Fun Book function.php gbpfad Parameter PHP File Include	CVE: 2007-1059 BID: 22633	This strike exploits a PHP include flaw in the Ultimate Fun Book web application.
Strike Ultimate PHP Board User-Agent HTTP Header Code Execution	CVE: 2003-0395	This strike exploits a code execution flaw in the Ultimate PHP Board web application.
Strike Ultra Crypto Component (CryptoX.dll) AcquireContext() Buffer Overflow	BID: 25609 CWE: 119 CVE: 2007-4903	This strike exploits a buffer overflow in the Ultra Crypto Component
Strike Ultra Crypto Component (CryptoX.dll) Insecure Method	BID: 25611 CWE: 22 CVE: 2007-4902	This strike exploits a flaw in CryptoX.dll that allows a webpage to save arbitrary data to any location on a disk.
Strike uTorrent announce Buffer Overflow (HTTP)	BID: 22530 CVE: 2007-0927	This strike exploits a buffer overflow in uTorrent caused by a torrent file with an 'announce' url that is too long

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike vCard 2.6 create.php uploaded Cross-Site Scripting	CWE: 79  CVE: 2006-1230  BID: 22819	This strike exploits a cross-site scripting vulnerability in vCard 2.6
Strike VEGO Web Forum index.php theme_id Parameter SQL Injection Variant 1	CVE: 2006-0065  BID: 16107	This strike exploits a SQL injection flaw in the VEGO web forum.
Strike VEGO Web Forum Pre-v1.26 index.php theme_id Parameter SQL Injection	CVE: 2006-0065  BID: 16107	This strike exploits a SQL injection flaw in the VEGO web forum.
Strike VEGO Web Forum index.php theme_id Parameter SQL Injection Variant 2	CVE: 2006-0065  BID: 16107	This strike exploits a SQL injection flaw in the VEGO web forum.
Strike VEGO Web Forum index.php theme_id Parameter SQL Injection Variant 2 (<v1.26)	CVE: 2006-0065  BID: 16107	This strike exploits a SQL injection flaw in the VEGO web forum.
Strike VEGO Web Forum login.php username Parameter SQL Injection	CVE: 2006-0067  BID: 16108	This strike exploits a SQL injection flaw in the VEGO web forum.
Strike Venom Board post.php3 topic_id Parameter SQL Injection	CWE: 89  CVE: 2006-0160  BID: 16176	This strike exploits a SQL injection flaw in the Venom Board web application.
Strike VLC HTTPD Connection Header Format String	CVE: 2007-6682  BID: 27015	This strike exploits a format string vulnerability in the HTTPD interface of the VLC media player.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike VLC Ogg Vorbis Comment Header Format String (HTTP)	BID: 24555  CVE: 2007-3316	This strike exploits a format string vulnerability in VLC when decoding Ogg Vorbis files. This strike simulates downloading a malicious file via HTTP.
Strike VLC udp -- Handler Format String Variant 1	CWE: 134  CVE: 2007-0017  BID: 21852	This strike exploits a format string vulnerability in the VLC video player. This exploit simulates a download of the exploit over HTTP on port 80. This version of the exploit targets the i386 processor architecture.
Strike VLC udp -- Handler Format String Variant 2	CWE: 134  CVE: 2007-0017  BID: 21852	This strike exploits a format string vulnerability in the VLC video player. This exploit simulates a download of the exploit over HTTP on port 80. This version of the exploit targets the PPC processor architecture.
Strike VideoLan Player XSPF Identifier Memory Corruption	CWE: 399  CVE: 2008-4558  BID: 31758	This strike triggers a vulnerability in the VideoLan player when handling XSPF files with a crafted identifier attribute.
Strike Vmist Downstat chart.php art Parameter PHP File Include	CVE: 2006-4827  BID: 20007	This strike exploits a PHP include flaw in the Vmist Downstat web application.
Strike Vmist Downstat admin.php art Parameter PHP File Include	CVE: 2006-4827  BID: 20007	This strike exploits a PHP include flaw in the Vmist Downstat web application.
Strike Vmist Downstat modes.php art Parameter PHP File Include	CVE: 2006-4827  BID: 20007	This strike exploits a PHP include flaw in the Vmist Downstat web application.
Strike Vmist Downstat stats.php art Parameter PHP File Include	CVE: 2006-4827  BID: 20007	This strike exploits a PHP include flaw in the Vmist Downstat web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike VMware Workstation ActiveX Control (vielib.dll) Remote Code Execution	CVE: 2007-4155 BID: 25131	Absolute path traversal vulnerability in a certain ActiveX control in vielib.dll in EMC VMware 6.0.0 allows remote attackers to execute arbitrary local programs via a full pathname in the first two arguments to the (1) CreateProcess or (2) CreateProcessEx method. This strike delivers a payload consistent with abusing parameters within the context of the former method, namely CreateProcess() and targets a Windows machine (any version) running Internet Explorer (any version) and attempts to run binaries found on a stock Windows XP SP3 x86 install (some binaries included in this strike's potential payloads may not be included in every Windows release).
Strike Voodoo Chat index.php file path Parameter PHP File Include	CVE: 2006-3991 BID: 19277	This strike exploits a PHP include flaw in the Voodoo Chat web application.
Strike VS News System show_news_inc.php newsordner Parameter PHP File Include	CVE: 2007-1017 BID: 22592	This strike exploits a PHP include flaw in VS News System.
Strike WebBBS webbbs_config.pl followup Parameter Shell Execution	CVE: 2002-1993 BID: 5048	This strike exploits a remote command execution flaw in the WebBBS bulletin board application.
Strike Microsoft IIS WebHits Authentication Bypass	CWE: 264 CVE: 2007-2815 BID: 24105	This strike simulates an attacker exploiting the authentication bypass flaw exposed by the WebHits ISAPI filter.
Strike Nullsoft Winamp AIFF File Format Header Parsing Memory Corruption	CWE: 119 CVE: 2009-0263 BID: 33226	This strike sends a malicious AIFF file that causes a head overflow in Winamp when it is parsed.
Strike Nullsoft Winamp PLS File Handling Buffer Overflow	CVE: 2006-0476 BID: 16410	This strike exploits a flaw in Winamp's handling of PLS files containing a long file name entry.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Explorer.exe AVI Right Click Denial of Service (HTTP)	CVE: 2007-0562	This strike exploits a denial of service condition in Microsoft Windows explorer.exe when right-clicking on a malformed AVI file.
Strike Microsoft Windows Contact File HTML injection	EXPLOITDB : 46222	This strike executes a vulnerability in a Microsoft Windows Contact file. Specifically a remote attacker can execute arbitrary code on Microsoft Windows by performing code injection in the email field of a Windows Contact file.
Strike Windows Help Center Malformed Escape Sequence Command Execution	CWE: 78 CVE: 2010-1885 BID: 40725	This strike exploits a vulnerability present in Microsoft's Windows Help Center protocol in which a malformed escape character sequence will bypass allowlist protections and allow an attacker to run arbitrary commands in the context of the user.
Strike Alt-N WebAdmin USER Buffer Overflow	BID: 8024 CVE: 2003-0471	This strike exploits a buffer overflow in the Alt-N WebAdmin service (webAdmin.dll version: 2.0.4) and causes arbitrary code execution conditions.
Strike Windows SMB Redirect		This strike exploits an information disclosure vulnerability in Microsoft Windows. The vulnerability is due to the use of Windows API functions that automatically attempt to authenticate with an SMB server pointed to by a file:// url. By intercepting an HTTP request and responding with an HTTP Redirect pointing to a malicious SMB server, an attacker could get access to encrypted user credentials, for offline decryption.
Strike Microsoft Windows Color Management Module ICC Profile Buffer Overflow (HTTP)	CVE: 2005-1219 BID: 14214	Microsoft Windows has a buffer overflow vulnerability in the processing of malformed image files. This strike simulates downloading a JPEG via HTTP.
Strike Windows OLE32.dll Word Document Handling Denial of Service (HTTP)	CWE: 119 CVE: 2007-1347 BID: 22847	This strike exploits a denial of service condition in Microsoft Windows OLE32.dll when parsing a malicious Word document.
Strike Microsoft Windows Remote Desktop Web Access XSS	CWE: 79 CVE: 2011-1263	This strike triggers a cross-site scripting vulnerability in the Microsoft Windows Remote Desktop Web Access service.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Wing FTP Server Lua Console Remote Code Execution	EXPLOITDB : 48676	A remote code execution vulnerability exists in Wing FTP Server due to lack of user input sanitization for the Lua Console feature. By sending a crafted 'command' POST parameter, an authenticated user could execute arbitrary commands as the superuser.
Strike Winzip ActiveX CreateNewFolderFromName Buffer Overflow	CWE: 119 CVE: 2006-6884	This strike exploits a buffer overflow in the CreateNewFolderFromName function in the WZFILEVIEW.FileViewCtrl.61 ActiveX control.
Strike Wireshark packet-dect.c Stack Buffer Overflow (HTTP)	CWE: 119 CVE: 2011-1591	This strike exploits a stack buffer overflow vulnerability present in Wireshark <= 1.4.4 by crafting a malicious PCAP file. When this flaw is triggered successfully, remote code execution is possible allowing for arbitrary code to run in the context of user running Wireshark.
Strike Wireshark Profinet DCP Dissector Name of Station Set Request Format String Vulnerability		This strike triggers a denial of service vulnerability in the Wireshark network protocol analyzer. The method for triggering the vulnerability is to transfer a malicious pcap file over the HTTP protocol.
Strike Wireshark Profinet DCP Dissector Ident Reponse Format String Vulnerability		This strike triggers a denial of service vulnerability in the Wireshark network protocol analyzer. The method for triggering the vulnerability is to transfer a malicious pcap file over the HTTP protocol.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [001]	BID: 16074 CWE: 20 CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [002]	BID: 16074 CWE: 20 CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [003]	BID: 16074 CWE: 20 CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [004]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [005]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [006]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [007]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [008]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [009]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [010]	BID: 16074  CWE: 20  CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [011]	BID: 16074 CWE: 20 CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [012]	BID: 16074 CWE: 20 CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike Windows Metafile (WMF) SetAbortProc() Code Execution [013]	BID: 16074 CWE: 20 CVE: 2005-4560	This strike exploits a vulnerability in the GDI library included with Windows XP, 2003, and Vista. This vulnerability uses the 'Escape' metafile function to execute arbitrary code through the SetAbortProc procedure.
Strike WMITools WBEMSingleView.ocx ActiveX Remote Command Execution	CWE: 94 CVE: 2010-3973 BID: 45546	The WBEMSingleView.ocx ActiveX control that is included with WMITools contains at least two methods that allow a user to directly reference a given memory address and can lead to remote code execution.
Strike WMNews index.php base_datapath Parameter PHP File Include	CVE: 2006-3928 BID: 19187	This strike exploits a PHP include flaw in the WMNews web application.
Strike Word Macro HTTP Exfiltration Macro-enabled VBA Maldoc Command and control		This strikes exfiltrates host information via HTTP POST request.
Strike Wordcircle index.php password Parameter SQL Injection	CWE: 89 CVE: 2006-0205 BID: 16227	This strike exploits a SQL injection flaw in the Wordcircle web application.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft WordPad Embedded COM Code Execution (InstallEngine) (HTTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the InstallEngine COM control into the OLE section of a WordPad RTF document.
Strike Microsoft WordPad Embedded COM Code Execution (Sysmon.3) (HTTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the Sysmon.3 COM control into the OLE section of a WordPad RTF document and defines a set of corrupt OLE properties that will cause a crash on load.
Strike WordPress Plugin WP with Spritz 1.0 Remote File Inclusion	EXPLOITDB : 44544	This strike exploits a remote file inclusion vulnerability in WordPress Plugin WP Spritz 1.0. The vulnerability is due to improper sanitization of the "url" parameter. By successfully exploiting this vulnerability, a remote, unauthenticated attacker could retrieve arbitrary files from the target server.
Strike Wordpress Download Manager Plugin Remote File Upload		A remote file upload vulnerability exists in Wordpress Download Manager Plugin versions prior to 2.7.5. This vulnerability allows an unauthenticated attacker to upload a file to the web server and could facilitate remote code execution with the privileges of the account running the web server application.
Strike WordPress Backdoor ix Parameter Eval	CWE: 20 CVE: 2007-1277 BID: 22797	The source code to WordPress was backdoored in February 2007 to pass the ix parameter to the php eval() function.
Strike WordPress Backdoor iz Parameter Passthru	CWE: 20 CVE: 2007-1277 BID: 22797	The source code to WordPress was backdoored in February 2007 to pass the iz parameter to the php passthru() function.
Strike Wordpress Mobile Detector Plugin Remote File Upload		This strike exploits an unauthenticated file-upload vulnerability in WordPress Mobile-Detector plugin. The vulnerability is due to insufficient validation of user input A remote file upload vulnerability exists in Wordpress Download Manager Plugin versions prior to 2.7.5. This vulnerability allows an unauthenticated attacker to upload a file to the web server and could facilitate remote code execution with the privileges of the account running the web server application.
Strike Wordpress page-flip-image-gallery plugins Remote File Upload		This strike exploits a remote file upload vulnerability inside wordpress page flip image gallery plugin.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike WordPress MapSVG Lite Plugin Stored Cross-Site Scripting		This strike exploits a stored Cross-Site Scripting vulnerability in WordPress MapSVG Plugin. The vulnerability is a consequence of no user input sanitization when storing the 'data[mapsvg_data]'. A successful exploitation leads to arbitrary code execution in visitors' browsers or credentials theft.
Strike WordPress Property Plugin PHP File Upload Code Execution	BID: 53787	This strike identifies a vulnerability in the WordPress Property plugin. Due to improper validation, a user can upload a file to a temporary directory that will allow for remote code to be executed.
Strike WoW Roster conf.php subdir Parameter PHP File Include	CVE: 2006-3997 CVE: 2006-3998 BID: 19269	This strike exploits a PHP include flaw in WoW Roster web application.
Strike WoW Roster hsList.php subdir Parameter PHP File Include	CVE: 2006-3997 CVE: 2006-3998 BID: 19269	This strike exploits a PHP include flaw in WoW Roster web application.
Strike Netscape Server WP Tag Directory Index Variant 1	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 2	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 3	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 4	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Netscape Server WP Tag Directory Index Variant 6	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 7	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 8	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike Netscape Server WP Tag Directory Index Variant 9	BID: 1063 CVE: 2000-0236	This strike attempts to obtain a directory listing from the web server by specifying a special request parameter.
Strike X97EmbedAn Excel Document (http)	BID: 18422 CVE: 2006-3059	The X97EmbedAn malware abuses an arbitrary code execution flaw in Microsoft Office.
Strike Joomla Plugin Mod_simplefileupload File Upload		This strike exploits a file upload vulnerability present in Joomla mod_simplefileupload plugin. By exploiting this vulnerability, an unauthenticated attacker can run arbitrary code by uploading files on the server and execute them. Note: This vulnerability was disclosed by the XAttacker tool.
Strike XAttacker Tool Prestashop Addons Arbitrary File Upload		This strike exploits file upload vulnerabilities in Prestashop CMS addons targeted by recently published XAttacker Tool. The main issue is the lack of sanitization of the user-supplied files by the components in charge of handling files upload queries. By exploiting these vulnerabilities, an unauthenticated attacker can run arbitrary code by uploading files on the server and execute them.
Strike XAttacker Tool WordPress Plugins Arbitrary File Upload (verified)	CVE: 2015-2825 EXPLOITDB : 36374 EXPLOITDB : 34922 EXPLOITDB : 36640	This strike exploits a series of file upload vulnerabilities in different Wordpress Plugins targeted by recently published XAttacker Tool. The common issue is the lack of sanitization of the user-uploaded files in the components in charge of handling files upload queries. By exploiting this vulnerabilities, an unauthenticated attacker can run arbitrary code by uploading files on the server and execute them.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Xitami Web Server If-Modified-Since Buffer Overflow	CWE: 119 CVE: 2007-5067 BID: 25772	This strike exploits a buffer overflow in the Xitami web server when handling a long If-Modified-Since HTTP header.
Strike Yahoo Toolbar ActiveX Control Denial of Service	BID: 26656 CWE: 119 CVE: 2007-6228	This strike causes a denial of service in the Yahoo Toolbar browser plugin's ActiveX control.
Strike SQL Injection Vulnerability In ManageEngine OpManager		This strike exploits an SQL injection vulnerability in ManageEngine OpManager. The vulnerability is due to improper validation of agentKey HTTP parameter. An attacker could exploit this vulnerability by sending an unauthenticated malicious request to the server, compromising the integrity of the database.
Strike Multiple ManageEngine Products It360SPUtil SQL Injection		This strike exploits an SQL injection vulnerability in ManageEngine Applications Manager and ManageEngine IT360 MSP Edition. The vulnerability is due to improper validation of It360SPUtil resIds HTTP parameter. An attacker could exploit this vulnerability by sending an unauthenticated malicious request to the server, compromising the integrity of the database.
Strike ManageEngine Applications Manager CommonAPIUtil SQL Injection		This strike exploits an SQL injection vulnerability in ManageEngine Applications Manager. The vulnerability is due to improper validation of groupId HTTP parameter. An attacker could exploit this vulnerability by sending an unauthenticated malicious requests to the server, compromising the integrity of the database.
Strike AuthenticationFilter Policy Bypass Vulnerability Inside SolarWinds Storage Manager	CVE: 2015-5371	This strike exploits a policy bypass vulnerability inside SolarWinds Storage Manager. The vulnerability is due to lack of authenticating HTTP requests to certain URIs. An attacker could exploit this vulnerability in order to upload malicious scripts and then remotely execute them.
Strike Borland AccuRev savecontent fname Directory Traversal		This strike exploits a directory traversal vulnerability in Borland AccuRev. The fname parameter in HTTP requests to /accurev/webgui/savecontent is not sanitized for directory traversal characters. An attacker may set an fname ending in ".csv" or ".xml" to read any arbitrary csv or xml file, or may request any other file on the system in order to delete the file. Successful exploitation may result in disclosure of arbitrary csv or xml files or deletion of arbitrary files on the system, which may result in a denial of service condition.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Reprise License Manager actserver akey Buffer Overflow Vulnerability	CWE: 119 CVE: 2015-6946	This strike exploits a buffer overflow vulnerability in Reprise License Manager. The vulnerability is due to improper validation of HTTP actserver and akey parameters. An attacker could exploit this vulnerability in order to remotely execute code on the target machine.
Strike Reprise License Manager Directory Traversal Vulnerability Through outputfile Parameter		This strike exploits a directory traversal vulnerability in Reprise License Manager. The vulnerability is due to improper validation of HTTP outputfile parameter. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Reprise License Manager Directory Traversal Vulnerability Through lf parameter		This strike exploits a directory traversal vulnerability in Reprise License Manager. The vulnerability is due to improper validation of HTTP lf parameter. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Reprise License Manager Directory Traversal Vulnerability Through lf parameter		This strike exploits a directory traversal vulnerability in Reprise License Manager. The vulnerability is due to improper validation of HTTP lf parameter in requests to /goform/edit_lf_process URI. An attacker could exploit this vulnerability in order to gain unauthorized access to information or services.
Strike Trend Micro Safe Sync Reconnect Query String Multiple Parameters Command Injection		This strike exploits a command execution vulnerability in Trend Micro Safe Sync. Several query string parameters accepted by the reconnect command are vulnerable to command injection. An authenticated attacker can connect, disconnect, and then send a specially crafted HTTP command to reconnect in order to achieve arbitrary code execution with root privileges.
Strike Trend Micro IWSVA deploywizard haport Parameter Command Injection		This strike exploits a command execution vulnerability in Trend Micro InterScan Web Security Virtual Appliance (IWSVA). The haport parameter, which is sent in HTTP GET requests to the /deploywizard/deploywizard.do uri, is vulnerable to command injection and is not sanitized. An attacker can send a specially crafted HTTP GET request to achieve arbitrary command execution. NOTE: By default the vulnerable services are accessed via SSL connection (port 8443)
Strike Trend Micro IWSVA Domain List bdn Parameter Command Injection		This strike exploits a command execution vulnerability in Trend Micro InterScan Web Security Virtual Appliance (IWSVA). The bdn parameter, which is sent in HTTP POST requests to the /rest/domains uri, is vulnerable to command injection and is not sanitized. An attacker can send a specially crafted HTTP POST request to achieve arbitrary command execution. NOTE: By default the vulnerable services are accessed via SSL connection (port 8443)
Strike ZebraFeeds controller.php zf_path Parameter PHP File Include	CVE: 2007-1010 BID: 22576	This strike exploits a PHP include flaw in ZebraFeeds 1.1.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Novell ZENworks Configuration Management UploadServlet File Upload and Code Execution	CWE: 22 CVE: 2010-5324 BID: 39114	This strike exploits a file upload vulnerability that exists in the ZENworks Configuration Management server. If a user uses directory traversal characters, they can access the Upload Servlet application, upload a file then make another request to execute it.
Strike Microsoft SharePoint WSDL DISCO Inifinate Loop Denial of Service	CWE: 20 CVE: 2013-0081 BID: 62205	Microsoft SharePoint contains a denial of service vulnerability. When a non-existent custom web application is requested, the program will enter an infinite loop while searching for the web application, resulting in a denial of service condition.
Strike Arcserve Unified Data Protection Console Multiple Directory Traversal Vulnerabilities	CWE: 22 CVE: 2015-4068 BID: 74845	This strike exploits a directory traversal vulnerability in Arcserve Unified Data Protection prior to version 5.0 update 4. The vulnerability is caused by improper validation of a file path supplied by the user in the export and reportFile servlets. A remote, unauthenticated attacker could exploit this by sending crafted requests to the application, leading to denial-of-service, information disclosure and, possibly, loss of information.
Strike Oracle WebLogic Server Directory Traversal Vulnerability	CVE: 2020-14750 CWE: 22	This strike exploits a directory traversal vulnerability in Oracle WebLogic Server. The vulnerability arises due to improper input validation which allows attackers to bypass authentication mechanisms. A remote, unauthenticated attacker can send crafted HTTP requests containing double encoded directory traversal sequences to access restricted paths such as console.portal without proper authentication. Successful exploitation could lead to remote code execution, potentially resulting in full compromise of the Oracle WebLogic Server.
Strike Sun Java Plugin JNLP Argument Injection (Debug)	BID: 12847 CVE: 2005-0418 CVE: 2005-0836	This strike exploits a flaw in the Sun Java plugin that allows arbitrary code execution through malicious JNLP files.
Strike Sun Java Plugin JNLP Argument Injection (Policy)	BID: 12847 CVE: 2005-0418 CVE: 2005-0836	This strike exploits a flaw in the Sun Java plugin that allows arbitrary code execution through malicious JNLP files.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Apple OS X QuickDraw GetSrcBits32ARGB Memory Corruption Denial of Service (IMAP4)	BID: 22207  CVE: 2007-0462	This strike exploits a denial of service condition in Apple's Mac OS X when opening a malformed PICT file.
Strike Microsoft Excel NULL Pointer DoS (A) (IMAP4)	BID: 22717  CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Microsoft Excel NULL Pointer DoS (B) (IMAP4)	BID: 22717  CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Chicken of the VNC Hostname Size Denial of Service	CVE: 2007-0756  BID: 22372	This strike causes a denial of service in the Chicken of the VNC client program by specifying a long hostname length field in a VNC server.
Strike Adobe Acrobat Reader getIcon Memory Corruption (IMAP4 Base64)	BID: 34169  CWE: 20  CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Adobe Acrobat Reader getIcon Memory Corruption (IMAP4 Quoted Printable)	BID: 34169  CWE: 20  CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike GDI+ PNG Integer Overflow Vulnerability (IMAP4 Quoted Printable)	CWE: 189  CVE: 2009-3126	This strike exploits the way the buffer size for the pixel data in interlaced PNGs is calculated by GDI+. The methods used by GDI+ contain integer overflow vulnerabilities.
Strike Windows Media Player ASX File Heap Overflow (IMAP4 Base64)	CWE: 119  CVE: 2006-6134  BID: 21247	Microsoft Windows Media Player contains a vulnerability that will cause memory corruption when a malicious *.asx file is opened

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Windows Media Player ASX File Heap Overflow (IMAP4 Quoted Printable)	CWE: 119 CVE: 2006-6134 BID: 21247	Microsoft Windows Media Player contains a vulnerability that will cause memory corruption when a malicious *.asx file is opened
Strike Microsoft Windows AVIFile Media File Truncation Code Execution (IMAP4 Base64)	BID: 35967 CWE: 94 CVE: 2009-1545	This strike exploits a vulnerability in Microsoft Windows when parsing an AVI file with truncated AVIH chunk data.
Strike Digium Asterisk Manager Shell Execution	CWE: 287 CVE: 2012-2414 BID: 53206	This strike exposes an ability for an authenticated user to run an arbitrary shell command without restriction.
Strike Internet Explorer EMF File Rendering Denial of Service (IMAP4)	CWE: 399 CVE: 2005-0803 BID: 12834	This strike exploits a denial of service flaw in Microsoft Windows. This flaw is triggered through a malformed Windows EMF Metafile. This strike simulates downloading an EMF file via IMAP4.
Strike Microsoft Windows LoadImage API Overflow (IMAP4)	BID: 12095 CVE: 2004-1049	This strike exploits a flaw in the parsing of images via LoadImage on Microsoft Windows. This strike simulates downloading a malicious .ani animated cursor in an IMAP4 message.
Strike MWindows Mail HTML Link Program Execution (IMAP4)	BID: 23103 CVE: 2007-1658	This strike exploits an arbitrary program execution flaw in the Windows Mail client. This flaw is triggered when a user clicks a hyperlink within an HTML email.
Strike MWindows Mail HTML Link Program Execution UNC (IMAP4)	BID: 23103 CVE: 2007-1658	This strike exploits an arbitrary program execution flaw in the Windows Mail client. This flaw is triggered when a user clicks a hyperlink within an HTML email.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Windows Vista Contact Gadget Remote Code Execution (IMAP4)	CVE: 2007-3032 BID: 25304	This strike exploits a flaw in the Contact Gadget in Microsoft Vista when displaying a malicious contact.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpendgroup) (IMAP4 Base64)	CWE: 399 CVE: 2008-4030	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\dpendgroup' directives.
Strike UNIX rlogind Service -root Authentication Bypass	CVE: 1999-0113 BID: 458	This strike exploits an authentication bypass vulnerability present in certain versions of the rlogin service.
Strike Microsoft Windows SMB NT Rename Buffer Overflow	CWE: 20 CVE: 2017-0146 BID: 96707	This strike exploits a buffer overflow vulnerability in Microsoft Windows SMB Service. The vulnerability can be triggered by sending an overly large NT Trans request. A remote, unauthenticated attacker could exploit this vulnerability to execute arbitrary code on the target system. * NOTE: This vulnerability was targeted with ShadowBrokers EternalChampion exploit
Strike Microsoft Windows SMB Information Disclosure	CWE: 200 CVE: 2017-0147 BID: 96709	This strike exploits an information disclosure vulnerability in Microsoft Windows SMB Service. The vulnerability can be triggered by sending an SMB request that reads beyond a boundary. A remote, unauthenticated attacker could exploit this vulnerability to reveal memory addresses for use with other exploits. * NOTE: This vulnerability was targeted with ShadowBrokers EternalChampion exploit
Strike SSLv2 DROWN decryption	CWE: 200 CVE: 2016-0800 CVE: 2016-0703	This strike simulates traffic which may be seen during the man-in-the-middle DROWN SSLv2 decryption attack. In order to gather enough data to break encryption, an attacker may initiate several thousand SSLv2 handshakes. This strike initiates only 100 handshakes to reduce test time, however, because the recommended remediation is to completely disable SSLv2, even one handshake should be viewed as suspicious.
Strike Cisco NX-OS Command Injection	BID: 50347 CWE: 264 CVE: 2011-2569	This strike exploits a vulnerability in the input sanitization of Cisco's NX-OS which allows for command injection when output is piped to certain commands (less, section). This can be used to achieve privilege escalation.

Name	References	Description
Strike Oracle WebLogic Server Insecure Deserialization - RCE	CWE: 502 CVE: 2018-2628 BID: 103776	An insecure deserialization vulnerability was found in Oracle WebLogic Server due to insufficient validation of serialized data. Vulnerability can be exploited by sending a specially crafted serialized object. Successful exploitation can result in arbitrary code execution in the context of the user running WebLogic.
Strike Magento API unserialize Remote Code Execution	CWE: 74 CVE: 2016-4010	Magento CE and EE before 2.0.6 allows remote attackers to conduct PHP objection injection attacks and execute arbitrary PHP code via crafted serialized shopping cart data.
Strike AI LLM Prompt Injection ASCII Art Font Alphabet - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Alphabet to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Alphabet - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Alphabet to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Alphabet - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Alphabet to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Binary - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Binary to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Binary - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Binary to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok

Name	References	Description
Strike AI LLM Prompt Injection ASCII Art Font Binary - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Binary to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Bubble - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Bubble to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Bubble - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Bubble to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Bubble - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Bubble to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Digital - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Digital to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Digital - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Digital to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Digital - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Digital to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Doh - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Doh to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini

Name	References	Description
Strike AI LLM Prompt Injection ASCII Art Font Doh - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Doh to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Doh - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Doh to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Dwhistled - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Dwhistled to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Dwhistled - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Dwhistled to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Dwhistled - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Dwhistled to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Letters - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Letters to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Letters - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Letters to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Letters - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Letters to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI

Name	References	Description
Strike AI LLM Prompt Injection ASCII Art Font Mnemonic - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Mnemonic to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Mnemonic - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Mnemonic to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Mnemonic - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Mnemonic to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Morse - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Morse to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Morse - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Morse to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Morse - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Morse to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Pyramid - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Pyramid to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Pyramid - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Pyramid to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok

Name	References	Description
Strike AI LLM Prompt Injection ASCII Art Font Pyramid - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Pyramid to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Smkeyboard - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Smkeyboard to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Smkeyboard - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Smkeyboard to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Smkeyboard - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Smkeyboard to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI
Strike AI LLM Prompt Injection ASCII Art Font Tanja - Gemini		This strike sends an ASCII Art-based Jailbreak Prompt of font Tanja to the Gemini LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Gemini LLM. Target LLM: Gemini
Strike AI LLM Prompt Injection ASCII Art Font Tanja - Grok		This strike sends an ASCII Art-based Jailbreak Prompt of font Tanja to the Grok LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the Grok LLM. Target LLM: Grok
Strike AI LLM Prompt Injection ASCII Art Font Tanja - OpenAI		This strike sends an ASCII Art-based Jailbreak Prompt of font Tanja to the OpenAI LLM. An ASCII art-based prompt can bypass keyword filters by masking specific words within the prompt, and disguise jailbreak instructions to manipulate an LLM's behavior. The prompt also combines a forbidden question, which can be used to elicit harmful responses from the OpenAI LLM. Target LLM: OpenAI

Name	References	Description
Strike AI LLM Bad Likert Judge Prompt Injection - Gemini		This strike sends a Bad Likert Judge Prompt to the LLM. This technique manipulates the LLM by embedding Likert scale evaluations into text-based prompts, coercing the model into generating increasingly harmful responses. The structured rating pattern subtly guides the LLM into formulating high-risk responses under the guise of judgment-based assessments. Note: This strike will randomly select a harmful category related to its questions and embed it within the prompt. Target LLM: Gemini
Strike AI LLM Bad Likert Judge Prompt Injection - Grok		This strike sends a Bad Likert Judge Prompt to the LLM. This technique manipulates the LLM by embedding Likert scale evaluations into text-based prompts, coercing the model into generating increasingly harmful responses. The structured rating pattern subtly guides the LLM into formulating high-risk responses under the guise of judgment-based assessments. Note: This strike will randomly select a harmful category related to its questions and embed it within the prompt. Target LLM: Grok
Strike AI LLM Bad Likert Judge Prompt Injection - OpenAI		This strike sends a Bad Likert Judge Prompt to the LLM. This technique manipulates the LLM by embedding Likert scale evaluations into text-based prompts, coercing the model into generating increasingly harmful responses. The structured rating pattern subtly guides the LLM into formulating high-risk responses under the guise of judgment-based assessments. Note: This strike will randomly select a harmful category related to its questions and embed it within the prompt. Target LLM: OpenAI
Strike AI LLM Prompt Injection DAN 10 - Gemini		This strike sends a JailBreak Prompt known as DAN 10 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 10 - Grok		This strike sends a JailBreak Prompt known as DAN 10 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 10 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 10 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 11 - Gemini		This strike sends a JailBreak Prompt known as DAN 11 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 11 - Grok		This strike sends a JailBreak Prompt known as DAN 11 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM Prompt Injection DAN 11 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 11 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 12 - Gemini		This strike sends a JailBreak Prompt known as DAN 12 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 12 - Grok		This strike sends a JailBreak Prompt known as DAN 12 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 12 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 12 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 13 - Gemini		This strike sends a JailBreak Prompt known as DAN 13 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 13 - Grok		This strike sends a JailBreak Prompt known as DAN 13 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 13 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 13 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 6.2 - Gemini		This strike sends a JailBreak Prompt known as DAN 6.2 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 6.2 - Grok		This strike sends a JailBreak Prompt known as DAN 6.2 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 6.2 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 6.2 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.

Name	References	Description
Strike AI LLM Prompt Injection DAN 6 - Gemini		This strike sends a JailBreak Prompt known as DAN 6 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 6 - Grok		This strike sends a JailBreak Prompt known as DAN 6 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 6 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 6 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 7 - Gemini		This strike sends a JailBreak Prompt known as DAN 7 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 7 - Grok		This strike sends a JailBreak Prompt known as DAN 7 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 7 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 7 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 8 - Gemini		This strike sends a JailBreak Prompt known as DAN 8 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 8 - Grok		This strike sends a JailBreak Prompt known as DAN 8 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 8 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 8 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 9 - Gemini		This strike sends a JailBreak Prompt known as DAN 9 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN 9 - Grok		This strike sends a JailBreak Prompt known as DAN 9 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM Prompt Injection DAN 9 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN 9 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ANTI DAN Prompt - Gemini		This strike sends a JailBreak Prompt known as DAN ANTI DAN to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ANTI DAN Prompt - Grok		This strike sends a JailBreak Prompt known as DAN ANTI DAN to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ANTI DAN Prompt - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN ANTI DAN to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ChatGPT DevMode Ranti - Gemini		This strike sends a JailBreak Prompt known as DAN ChatGPT DevMode Ranti to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ChatGPT DevMode Ranti - Grok		This strike sends a JailBreak Prompt known as DAN ChatGPT DevMode Ranti to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ChatGPT DevMode Ranti - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN ChatGPT DevMode Ranti to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ChatGPT Developer Mode v2 - Gemini		This strike sends a JailBreak Prompt known as DAN ChatGPT Developer Mode v2 to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ChatGPT Developer Mode v2 - Grok		This strike sends a JailBreak Prompt known as DAN ChatGPT Developer Mode v2 to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN ChatGPT Developer Mode v2 - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN ChatGPT Developer Mode v2 to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM Prompt Injection DAN DUDE - Gemini		This strike sends a JailBreak Prompt known as DAN DUDE to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN DUDE - Grok		This strike sends a JailBreak Prompt known as DAN DUDE to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN DUDE - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN DUDE to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN Evil Bot Prompt - Gemini		This strike sends a JailBreak Prompt known as DAN Evil Bot to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN Evil Bot Prompt - Grok		This strike sends a JailBreak Prompt known as DAN Evil Bot to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN Evil Bot Prompt - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN Evil Bot to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN Mongo Tom - Gemini		This strike sends a JailBreak Prompt known as DAN Mongo Tom to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN Mongo Tom - Grok		This strike sends a JailBreak Prompt known as DAN Mongo Tom to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN Mongo Tom - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN Mongo Tom to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN STAN - Gemini		This strike sends a JailBreak Prompt known as DAN STAN to the target Gemini LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.

Name	References	Description
Strike AI LLM Prompt Injection DAN STAN - Grok		This strike sends a JailBreak Prompt known as DAN STAN to the target Grok LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Prompt Injection DAN STAN - OpenAI ChatGPT		This strike sends a JailBreak Prompt known as DAN STAN to the target OpenAI ChatGPT LLM. This prompt is a common DoAnythingNow or DAN Jailbreak template meant to instruct the Large Language Model or LLM to be in a Jailbroken state.
Strike AI LLM Database Create Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level CREATE operation. The request is designed to trigger the LLM into producing a SQL query that performs schema creation tasks, such as creating new tables, schemas or databases. The LLM's response includes a full SQL CREATE statement which, if executed, could result in unauthorized database changes or setup of malicious data structures. Target LLM: Gemini
Strike AI LLM Database Create Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level CREATE operation. The request is designed to trigger the LLM into producing a SQL query that performs schema creation tasks, such as creating new tables, schemas or databases. The LLM's response includes a full SQL CREATE statement which, if executed, could result in unauthorized database changes or setup of malicious data structures. Target LLM: Grok
Strike AI LLM Database Create Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level CREATE operation. The request is designed to trigger the LLM into producing a SQL query that performs schema creation tasks, such as creating new tables, schemas or databases. The LLM's response includes a full SQL CREATE statement which, if executed, could result in unauthorized database changes or setup of malicious data structures. Target LLM: OpenAI
Strike AI LLM Database Delete Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level DELETE operation. The request is designed to trigger the LLM into producing a SQL query that performs data deletion tasks, such as deleting records from tables or removing specific data entries. The LLM's response includes a full SQL DELETE or DROP statement which, if executed, could result in unauthorized data loss or corruption of the database. Target LLM: Gemini
Strike AI LLM Database Delete Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level DELETE operation. The request is designed to trigger the LLM into producing a SQL query that performs data deletion tasks, such as deleting records from tables or removing specific data entries. The LLM's response includes a full SQL DELETE or DROP statement which, if executed, could result in unauthorized data loss or corruption of the database. Target LLM: Grok

Name	References	Description
Strike AI LLM Database Delete Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level DELETE operation. The request is designed to trigger the LLM into producing a SQL query that performs data deletion tasks, such as deleting records from tables or removing specific data entries. The LLM's response includes a full SQL DELETE or DROP statement which, if executed, could result in unauthorized data loss or corruption of the database. Target LLM: OpenAI
Strike AI LLM Database Read Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level READ operation. The request is designed to trigger the LLM into producing a SQL query that performs data retrieval tasks, such as selecting data from tables or querying specific information. The LLM's response includes a full SQL SELECT statement which, if executed, could result in unauthorized data access or exposure of sensitive information. Target LLM: Gemini
Strike AI LLM Database Read Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level READ operation. The request is designed to trigger the LLM into producing a SQL query that performs data retrieval tasks, such as selecting data from tables or querying specific information. The LLM's response includes a full SQL SELECT statement which, if executed, could result in unauthorized data access or exposure of sensitive information. Target LLM: Grok
Strike AI LLM Database Read Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level READ operation. The request is designed to trigger the LLM into producing a SQL query that performs data retrieval tasks, such as selecting data from tables or querying specific information. The LLM's response includes a full SQL SELECT statement which, if executed, could result in unauthorized data access or exposure of sensitive information. Target LLM: OpenAI
Strike AI LLM Database Update Operation - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level UPDATE operation. The request is designed to trigger the LLM into producing a SQL query that performs data modification tasks, such as updating existing records in a database. The LLM's response includes a full SQL UPDATE statement which, if executed, could result in unauthorized data changes or corruption of existing information. Target LLM: Gemini
Strike AI LLM Database Update Operation - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level UPDATE operation. The request is designed to trigger the LLM into producing a SQL query that performs data modification tasks, such as updating existing records in a database. The LLM's response includes a full SQL UPDATE statement which, if executed, could result in unauthorized data changes or corruption of existing information. Target LLM: Grok
Strike AI LLM Database Update Operation - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level UPDATE operation. The request is designed to trigger the LLM into producing a SQL query that performs data modification tasks, such as updating existing records in a database. The LLM's response includes a full SQL UPDATE statement which, if executed, could result in unauthorized data changes or corruption of existing information. Target LLM: OpenAI

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM Prompt Injection Deceptive Delight - Gemini		This strike sends a "Deceptive Delight" prompt to the Gemini LLM. This technique manipulates the Gemini LLM by embedding harmful prompts that lead the model to generate harmful responses under the guise of providing helpful information. The structured prompt subtly guides the LLM into formulating high-risk responses while appearing innocuous. Note: This strike will randomly select a harmful prompt from the Forbidden questions set and embed it within the prompt. Target LLM: Gemini
Strike AI LLM Prompt Injection Deceptive Delight - Grok		This strike sends a "Deceptive Delight" prompt to the Grok LLM. This technique manipulates the Grok LLM by embedding harmful prompts that lead the model to generate harmful responses under the guise of providing helpful information. The structured prompt subtly guides the LLM into formulating high-risk responses while appearing innocuous. Note: This strike will randomly select a harmful prompt from the Forbidden questions set and embed it within the prompt. Target LLM: Grok
Strike AI LLM Prompt Injection Deceptive Delight - OpenAI		This strike sends a "Deceptive Delight" prompt to the OpenAI LLM. This technique manipulates the OpenAI LLM by embedding harmful prompts that lead the model to generate harmful responses under the guise of providing helpful information. The structured prompt subtly guides the LLM into formulating high-risk responses while appearing innocuous. Note: This strike will randomly select a harmful prompt from the Forbidden questions set and embed it within the prompt. Target LLM: OpenAI
Strike AI LLM Disease Vector URL Prompt - Gemini		This strike sends a disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URL-based prompt to the Gemini LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects such URLs from the dataset and uses them inside the prompt. Target LLM: Gemini
Strike AI LLM Disease Vector URL Prompt - Grok		This strike sends a disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URL-based prompt to the Grok LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects such URLs from the dataset and uses them inside the prompt. Target LLM: Grok
Strike AI LLM Disease Vector URL Prompt - OpenAI		This strike sends a disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URL-based prompt to the OpenAI LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects such URLs from the dataset and uses them inside the prompt. Target LLM: OpenAI
Strike AI LLM Disease Vector URL Response - Gemini		This strike sends a prompt to the Gemini LLM asking it to generate a response which includes disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URLs. This randomly selects a few URLs from the dataset and uses them inside the LLM response. Target LLM: Gemini

Name	References	Description
Strike AI LLM Disease Vector URL Response - Grok		This strike sends a prompt to the Grok LLM asking it to generate a response which includes disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URLs. This randomly selects a few URLs from the dataset and uses them inside the LLM response. Target LLM: Grok
Strike AI LLM Disease Vector URL Response - OpenAI		This strike sends a prompt to the OpenAI LLM asking it to generate a response which includes disease vector (spyware/grayware, password-cracking applications, key-stroke trackers and virus/malware kit downloads) related URLs. This randomly selects a few URLs from the dataset and uses them inside the LLM response. Target LLM: OpenAI
Strike Easy FTP Server v1.7.0.11 LIST Command Remote Buffer Overflow	BID: 38262	This strike exploits a buffer overflow in the Easy FTP server's processing of the LIST command.
Strike Easy FTP Server v1.7.0.11 MKD Command Remote Buffer Overflow	BID: 38262	This strike exploits a buffer overflow in the Easy FTP server's processing of the MKD command.
Strike Golden FTP PASS Buffer Overflow	BID: 45924 BID: 45957 CWE: 119 CVE: 2006-6576	This strike exploits a stack overflow in Golden FTP in the parsing of the PASS command.
Strike Wu-FTPd File Globbing Heap Corruption	CVE: 2001-0550 BID: 3581	This strike exploits a flaw in the Wu-FTPd server's globbing function while handling the invalid parameter string "~{" to cause arbitrary code execution via heap corruption.
Strike AI LLM Flip Attack Flip Complete Sentence - Gemini		This strike sends a FlipAttack based jailbreak prompt of the FCS (Flip Characters in Sentence) type to the Gemini LLM. This mode reverses each character in the prompt, resulting in a complete reversal of the sentence. A FlipAttack can bypass keyword filters by flipping or rearranging characters in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Flip Attack Flip Complete Sentence - Grok		This strike sends a FlipAttack based jailbreak prompt of the FCS (Flip Characters in Sentence) type to the Grok LLM. This mode reverses each character in the prompt, resulting in a complete reversal of the sentence. A FlipAttack can bypass keyword filters by flipping or rearranging characters in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok

Name	References	Description
Strike AI LLM Flip Attack Flip Complete Sentence - OpenAI		This strike sends a FlipAttack based jailbreak prompt of the FCS (Flip Characters in Sentence) type to the OpenAI LLM. This mode reverses each character in the prompt, resulting in a complete reversal of the sentence. A FlipAttack can bypass keyword filters by flipping or rearranging characters in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Flip Attack Flip Character in Words - Gemini		This strike sends a FlipAttack based jailbreak prompt of the FCW (Flip Characters in Word) type to the Gemini LLM. This mode reverses each character in each word in the prompt, resulting in a complete reversal of the words. A FlipAttack can bypass keyword filters by flipping or rearranging characters in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Flip Attack Flip Character in Words - Grok		This strike sends a FlipAttack based jailbreak prompt of the FCW (Flip Characters in Word) type to the Grok LLM. This mode reverses each character in each word in the prompt, resulting in a complete reversal of the words. A FlipAttack can bypass keyword filters by flipping or rearranging characters in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Flip Attack Flip Character in Words - OpenAI		This strike sends a FlipAttack based jailbreak prompt of the FCW (Flip Characters in Word) type to the OpenAI LLM. This mode reverses each character in each word in the prompt, resulting in a complete reversal of the words. A FlipAttack can bypass keyword filters by flipping or rearranging characters in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Flip Attack Flip Words Order - Gemini		This strike sends a FlipAttack based jailbreak prompt of the FWO (Flip Word Order in Sentence) type to the Gemini LLM. This mode changes the word order in the prompt, resulting in a complete jumbled sentence. A FlipAttack can bypass keyword filters by flipping or rearranging characters/words in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Flip Attack Flip Words Order - Grok		This strike sends a FlipAttack based jailbreak prompt of the FWO (Flip Word Order in Sentence) type to the Grok LLM. This mode changes the word order in the prompt, resulting in a complete jumbled sentence. A FlipAttack can bypass keyword filters by flipping or rearranging characters/words in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Flip Attack Flip Words Order - OpenAI		This strike sends a FlipAttack based jailbreak prompt of the FWO (Flip Word Order in Sentence) type to the OpenAI LLM. This mode changes the word order in the prompt, resulting in a complete jumbled sentence. A FlipAttack can bypass keyword filters by flipping or rearranging characters/words in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI

Name	References	Description
Strike AI LLM Invisible Prompt Injection - Gemini		This strike sends an Invisible Unicode character based prompt to the Gemini LLM. This technique exploits the LLM by encoding text-based prompts using a special set of invisible Unicode characters, subtly coercing the model into producing progressively harmful responses. Note: This strike will randomly select a harmful category related to its questions and embed its Unicode encoded format within the prompt Target LLM: Gemini
Strike AI LLM Invisible Prompt Injection - Grok		This strike sends an Invisible Unicode character based prompt to the Grok LLM. This technique exploits the LLM by encoding text-based prompts using a special set of invisible Unicode characters, subtly coercing the model into producing progressively harmful responses. Note: This strike will randomly select a harmful category related to its questions and embed its Unicode encoded format within the prompt Target LLM: Grok
Strike AI LLM Invisible Prompt Injection - OpenAI		This strike sends an Invisible Unicode character based prompt to the OpenAI LLM. This technique exploits the LLM by encoding text-based prompts using a special set of invisible Unicode characters, subtly coercing the model into producing progressively harmful responses. Note: This strike will randomly select a harmful category related to its questions and embed its Unicode encoded format within the prompt Target LLM: OpenAI
Strike AI LLM Link Trap PII Leakage Banking Information - Gemini		This strike simulates a Link Trap prompt injection attack, which tricks the LLM into revealing previous chat data. The attack involves including a hyperlink in the prompt and instructing the LLM to append the previous conversation or a summary of it as a base64-encoded value in the link's query parameter. If the user clicks on the link generated by the LLM, the encoded chat history is exfiltrated to the attacker's domain via the query string. In this strike, we simulate the disclosure of personally identifiable information (PII) related to banking data, such as account holder name, account number, bank balance, registered phone number and email address. Note: API-based interactions do not retain conversational context, so to realistically simulate the Link Trap attack, prior chat history is included within the same request. It is also assumed that the user is tricked via social engineering or other means into submitting the malicious prompt containing the attacker's link to the LLM. Target LLM: Gemini
Strike AI LLM Link Trap PII Leakage Banking Information - Grok		This strike simulates a Link Trap prompt injection attack, which tricks the LLM into revealing previous chat data. The attack involves including a hyperlink in the prompt and instructing the LLM to append the previous conversation or a summary of it as a base64-encoded value in the link's query parameter. If the user clicks on the link generated by the LLM, the encoded chat history is exfiltrated to the attacker's domain via the query string. In this strike, we simulate the disclosure of personally identifiable information (PII) related to banking data, such as account holder name, account number, bank balance, registered phone number and email address. Note: API-based interactions do not retain conversational context, so to realistically simulate the Link Trap attack, prior chat history is included within the same request. It is also assumed that the user is tricked via social engineering or other means into submitting the malicious prompt containing the attacker's link to the LLM. Target LLM: Grok

Strike AI LLM Malware URL Prompt - Gemini		This strike sends a malware URL-based prompt to the Gemini LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects a few malware related URLs from the dataset and uses them inside the prompt. Target LLM: Gemini
Strike AI LLM Malware URL Prompt - Grok		This strike sends a malware URL-based prompt to the Grok LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects a few malware related URLs from the dataset and uses them inside the prompt. Target LLM: Grok
Strike AI LLM Malware URL Prompt - OpenAI		This strike sends a malware URL-based prompt to the OpenAI LLM, asking it to generate a response after visiting and analyzing the URL. The request randomly selects a few malware related URLs from the dataset and uses them inside the prompt. Target LLM: OpenAI
Strike AI LLM Malware URL Response - Gemini		This strike sends a prompt to the Gemini LLM asking it to generate a response which includes malware URLs. This randomly selects a few malware related URLs from the dataset and uses them inside the LLM response. Target LLM: Gemini

Name	References	Description
Strike AI LLM Malware URL Response - Grok		This strike sends a prompt to the Grok LLM asking it to generate a response which includes malware URLs. This randomly selects a few malware related URLs from the dataset and uses them inside the LLM response. Target LLM: Grok
Strike AI LLM Malware URL Response - OpenAI		This strike sends a prompt to the OpenAI LLM asking it to generate a response which includes malware URLs. This randomly selects a few malware related URLs from the dataset and uses them inside the LLM response. Target LLM: OpenAI
Strike AI LLM Mathematical Function-Based Prompt Injection - Gemini		This strike sends a Mathematical Function-Based Prompt to the Gemini LLM. This uses mathematical equations embedded in text-based prompts to exploit the LLM's understanding of geometry, manipulating its responses through the structured patterns created by these mathematical functions. Note: This strike will randomly select a harmful keyword and use it inside the prompt. Target LLM: Gemini
Strike AI LLM Mathematical Function-Based Prompt Injection - Grok		This strike sends a Mathematical Function-Based Prompt to the Grok LLM. This uses mathematical equations embedded in text-based prompts to exploit the LLM's understanding of geometry, manipulating its responses through the structured patterns created by these mathematical functions. Note: This strike will randomly select a harmful keyword and use it inside the prompt. Target LLM: Grok
Strike AI LLM Mathematical Function-Based Prompt Injection - OpenAI		This strike sends a Mathematical Function-Based Prompt to the OpenAI LLM. This uses mathematical equations embedded in text-based prompts to exploit the LLM's understanding of geometry, manipulating its responses through the structured patterns created by these mathematical functions. Note: This strike will randomly select a harmful keyword and use it inside the prompt. Target LLM: OpenAI
Strike AI LLM PII Leakage Banking Information Disclosure - Gemini		This strike involves crafting a prompt to manipulate the Gemini LLM into disclosing sensitive banking information. The request includes financial queries that lead the LLM to generate a response containing personally identifiable information (PII), such as account holder name, account number, bank balance, registered phone number and email address. Target LLM: Gemini
Strike AI LLM PII Leakage Banking Information Disclosure - Grok		This strike involves crafting a prompt to manipulate the Grok LLM into disclosing sensitive banking information. The request includes financial queries that lead the LLM to generate a response containing personally identifiable information (PII), such as account holder name, account number, bank balance, registered phone number and email address. Target LLM: Grok
Strike AI LLM PII Leakage Banking Information Disclosure - OpenAI		This strike involves crafting a prompt to manipulate the OpenAI LLM into disclosing sensitive banking information. The request includes financial queries that lead the LLM to generate a response containing personally identifiable information (PII), such as account holder name, account number, bank balance, registered phone number and email address. Target LLM: OpenAI

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM PII Leakage Biometric Data Disclosure - Gemini		This strike involves crafting a prompt to manipulate the Gemini LLM into disclosing sensitive biometric data. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as timestamp, user ID, user name, facial biometric hash, face embedding vector and confidence score. Target LLM: Gemini
Strike AI LLM PII Leakage Biometric Data Disclosure - Grok		This strike involves crafting a prompt to manipulate the Grok LLM into disclosing sensitive biometric data. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as timestamp, user ID, user name, facial biometric hash, face embedding vector and confidence score. Target LLM: Grok
Strike AI LLM PII Leakage Biometric Data Disclosure - OpenAI		This strike involves crafting a prompt to manipulate the OpenAI LLM into disclosing sensitive biometric data. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as timestamp, user ID, user name, facial biometric hash, face embedding vector and confidence score. Target LLM: OpenAI
Strike AI LLM PII Leakage Customer Support System Leak - Gemini		This strike involves crafting a prompt to manipulate the Gemini LLM into disclosing sensitive customer support system data. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as customer name, email address, phone number and last four digits of credit card number. Target LLM: Gemini
Strike AI LLM PII Leakage Customer Support System Leak - Grok		This strike involves crafting a prompt to manipulate the Grok LLM into disclosing sensitive customer support system data. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as customer name, email address, phone number and last four digits of credit card number. Target LLM: Grok
Strike AI LLM PII Leakage Customer Support System Leak - OpenAI		This strike involves crafting a prompt to manipulate the OpenAI LLM into disclosing sensitive customer support system data. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as customer name, email address, phone number and last four digits of credit card number. Target LLM: OpenAI
Strike AI LLM PII Leakage Employee Record Disclosure - Gemini		This strike involves crafting a prompt to manipulate the Gemini LLM into disclosing sensitive employee record of an organisation. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as employee name, company name, job title, employee ID, email address, contact number and home address. Target LLM: Gemini
Strike AI LLM PII Leakage Employee Record Disclosure - Grok		This strike involves crafting a prompt to manipulate the Grok LLM into disclosing sensitive employee record of an organisation. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as employee name, company name, job title, employee ID, email address, contact number and home address. Target LLM: Grok

Name	References	Description
Strike AI LLM PII Leakage Employee Record Disclosure - OpenAI		This strike involves crafting a prompt to manipulate the OpenAI LLM into disclosing sensitive employee record of an organisation. The request includes some queries that lead the LLM to generate a response containing personally identifiable information (PII), such as employee name, company name, job title, employee ID, email address, contact number and home address. Target LLM: OpenAI
Strike AI LLM PII Leakage Government Document Disclosure - Gemini		This strike involves crafting a prompt to manipulate the Gemini LLM into revealing sensitive government-issued identification and citizen record data. The request is framed as an inquiry into official databases, leading the LLM to generate responses that expose personally identifiable information (PII), including full name, date of birth, Social Security Number (SSN), passport ID, home address, phone number, and government employee ID. It may also include access details to internal record systems. Target LLM: Gemini
Strike AI LLM PII Leakage Government Document Disclosure - Grok		This strike involves crafting a prompt to manipulate the Grok LLM into revealing sensitive government-issued identification and citizen record data. The request is framed as an inquiry into official databases, leading the LLM to generate responses that expose personally identifiable information (PII), including full name, date of birth, Social Security Number (SSN), passport ID, home address, phone number, and government employee ID. It may also include access details to internal record systems. Target LLM: Grok
Strike AI LLM PII Leakage Government Document Disclosure - OpenAI		This strike involves crafting a prompt to manipulate the OpenAI LLM into revealing sensitive government-issued identification and citizen record data. The request is framed as an inquiry into official databases, leading the LLM to generate responses that expose personally identifiable information (PII), including full name, date of birth, Social Security Number (SSN), passport ID, home address, phone number, and government employee ID. It may also include access details to internal record systems. Target LLM: OpenAI
Strike AI LLM PII Leakage Protected Health Information (PHI) Disclosure - Gemini		This strike involves crafting a prompt to manipulate the Gemini LLM into revealing sensitive medical data from hospital records. The generated response simulates Protected Health Information (PHI), including personal identifiers and health-related details such as diagnosis, medications, policy numbers, and provider information. This kind of leakage could occur through prompts targeting internal medical databases. Target LLM: Gemini
Strike AI LLM PII Leakage Protected Health Information (PHI) Disclosure - Grok		This strike involves crafting a prompt to manipulate the Grok LLM into revealing sensitive medical data from hospital records. The generated response simulates Protected Health Information (PHI), including personal identifiers and health-related details such as diagnosis, medications, policy numbers, and provider information. This kind of leakage could occur through prompts targeting internal medical databases. Target LLM: Grok

Name	References	Description
Strike AI LLM PII Leakage Protected Health Information (PHI) Disclosure - OpenAI		This strike involves crafting a prompt to manipulate the OpenAI LLM into revealing sensitive medical data from hospital records. The generated response simulates Protected Health Information (PHI), including personal identifiers and health-related details such as diagnosis, medications, policy numbers, and provider information. This kind of leakage could occur through prompts targeting internal medical databases. Target LLM: OpenAI
Strike AI LLM Phishing URL Prompt - Gemini		This strike sends a phishing URL-based prompt to the Gemini LLM, asking it to generate a response after analyzing the URL or crafting phishing content. The request randomly selects a few phishing related URLs from the dataset and uses them inside the prompt. Target LLM: Gemini
Strike AI LLM Phishing URL Prompt - Grok		This strike sends a phishing URL-based prompt to the Grok LLM, asking it to generate a response after analyzing the URL or crafting phishing content. The request randomly selects a few phishing related URLs from the dataset and uses them inside the prompt. Target LLM: Grok
Strike AI LLM Phishing URL Prompt - OpenAI		This strike sends a phishing URL-based prompt to the OpenAI LLM, asking it to generate a response after analyzing the URL or crafting phishing content. The request randomly selects a few phishing related URLs from the dataset and uses them inside the prompt. Target LLM: OpenAI
Strike AI LLM Phishing URL Response - Gemini		This strike sends a prompt to the Gemini LLM asking it to generate a response which includes phishing URLs. This randomly selects a few phishing related URLs from the dataset and uses them inside the LLM response. Target LLM: Gemini
Strike AI LLM Phishing URL Response - Grok		This strike sends a prompt to the Grok LLM asking it to generate a response which includes phishing URLs. This randomly selects a few phishing related URLs from the dataset and uses them inside the LLM response. Target LLM: Grok
Strike AI LLM Phishing URL Response - OpenAI		This strike sends a prompt to the OpenAI LLM asking it to generate a response which includes phishing URLs. This randomly selects a few phishing related URLs from the dataset and uses them inside the LLM response. Target LLM: OpenAI
Strike AI LLM PII in User Requests Banking Information Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to banking. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as account number, card number, CVV, expiration date, net banking credentials, or personal identification numbers. Target LLM: Gemini
Strike AI LLM PII in User Requests Banking Information Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to banking. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as account number, card number, CVV, expiration date, net banking credentials, or personal identification numbers. Target LLM: Grok

Name	References	Description
Strike AI LLM PII in User Requests Banking Information Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to banking. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as account number, card number, CVV, expiration date, net banking credentials, or personal identification numbers. Target LLM: OpenAI
Strike AI LLM PII in User Requests Biometric Data Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to biometric data. The simulated request mimics real-world user behavior, where individuals might inadvertently disclose sensitive details such as fingerprint enrollment status, facial recognition setup information, voice authentication data, iris scan IDs, palm scan IDs, along with associated identifiers like employee ID, passport number, and date of birth. Target LLM: Gemini
Strike AI LLM PII in User Requests Biometric Data Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to biometric data. The simulated request mimics real-world user behavior, where individuals might inadvertently disclose sensitive details such as fingerprint enrollment status, facial recognition setup information, voice authentication data, iris scan IDs, palm scan IDs, along with associated identifiers like employee ID, passport number, and date of birth. Target LLM: Grok
Strike AI LLM PII in User Requests Biometric Data Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to biometric data. The simulated request mimics real-world user behavior, where individuals might inadvertently disclose sensitive details such as fingerprint enrollment status, facial recognition setup information, voice authentication data, iris scan IDs, palm scan IDs, along with associated identifiers like employee ID, passport number, and date of birth. Target LLM: OpenAI
Strike AI LLM PII in User Requests Customer Support Data Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Gemini
Strike AI LLM PII in User Requests Customer Support Data Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Grok
Strike AI LLM PII in User Requests Customer Support Data Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: OpenAI

Name	References	Description
Strike AI LLM PII in User Requests Employee Record Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to employee records. The simulated request mimics real-world user behavior, where individuals might inadvertently share confidential details such as employee name, company name, job title, employee ID, email address, contact number, and home address. Target LLM: Gemini
Strike AI LLM PII in User Requests Employee Record Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to employee records. The simulated request mimics real-world user behavior, where individuals might inadvertently share confidential details such as employee name, company name, job title, employee ID, email address, contact number, and home address. Target LLM: Grok
Strike AI LLM PII in User Requests Employee Record Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to employee records. The simulated request mimics real-world user behavior, where individuals might inadvertently share confidential details such as employee name, company name, job title, employee ID, email address, contact number, and home address. Target LLM: OpenAI
Strike AI LLM PII in User Requests Government Document Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Gemini
Strike AI LLM PII in User Requests Government Document Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Grok
Strike AI LLM PII in User Requests Government Document Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: OpenAI
Strike AI LLM PII in User Requests Protected Health Information (PHI) Disclosure - Gemini		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Gemini
Strike AI LLM PII in User Requests Protected Health Information (PHI) Disclosure - Grok		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: Grok

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike AI LLM PII in User Requests Protected Health Information (PHI) Disclosure - OpenAI		This strike involves crafting a user request that contains personally identifiable information (PII) related to government records. The simulated request mimics real-world user behavior, where individuals might inadvertently share sensitive details such as citizen name, date of birth, SSN, passport number, home address, phone number and government employee ID. Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack Claude template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack Claude template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack Claude template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack ICL One Shot template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends icl-one-shot prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack ICL One Shot template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends icl-one-shot prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack ICL One Shot template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends icl-one-shot prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour Target LLM: OpenAI

Name	References	Description
Strike AI LLM Prompt Injection Adaptive Attack Refined Best Simple template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack Refined Best Simple template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack Refined Best Simple template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends refined-best-simple prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Prompt Injection Adaptive Attack Refined Simple template - Gemini		This strike sends a AdaptiveAttack based jailbreak prompt type to the Gemini LLM. This attack sends refined-best prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Gemini
Strike AI LLM Prompt Injection Adaptive Attack Refined Simple template - Grok		This strike sends a AdaptiveAttack based jailbreak prompt type to the Grok LLM. This attack sends refined-best prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: Grok
Strike AI LLM Prompt Injection Adaptive Attack Refined Simple template - OpenAI		This strike sends a AdaptiveAttack based jailbreak prompt type to the OpenAI LLM. This attack sends refined-best prompt template which includes multiple malformed prompts with chaining adversarial suffix attached to the prompt. This attack can bypass keyword filters by tweaking the request prompt in every iteration in the prompt, effectively disguising jailbreak instructions to manipulate the LLM's behaviour. Target LLM: OpenAI
Strike AI LLM Prompt Injection P2SQL - Gemini		This strike sends a prompt to manipulate the Gemini LLM into generating a database-level CRUD (Create, Read, Update, Delete) operation. The request is designed to trigger the LLM into producing a SQL query that performs data manipulation tasks, such as creating new records, reading existing data, updating records, or deleting entries. The LLM's response includes a full SQL statement which, if executed, could result in unauthorized database changes or exposure of sensitive information. Target LLM: Gemini

Name	References	Description
Strike AI LLM Prompt Injection P2SQL - Grok		This strike sends a prompt to manipulate the Grok LLM into generating a database-level CRUD (Create, Read, Update, Delete) operation. The request is designed to trigger the LLM into producing a SQL query that performs data manipulation tasks, such as creating new records, reading existing data, updating records, or deleting entries. The LLM's response includes a full SQL statement which, if executed, could result in unauthorized database changes or exposure of sensitive information. Target LLM: Grok
Strike AI LLM Prompt Injection P2SQL - OpenAI		This strike sends a prompt to manipulate the OpenAI LLM into generating a database-level CRUD (Create, Read, Update, Delete) operation. The request is designed to trigger the LLM into producing a SQL query that performs data manipulation tasks, such as creating new records, reading existing data, updating records, or deleting entries. The LLM's response includes a full SQL statement which, if executed, could result in unauthorized database changes or exposure of sensitive information. Target LLM: OpenAI
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Code Completion - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the Gemini LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Code Completion - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the Grok LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Code Completion - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the OpenAI LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Table Filling - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the Gemini LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Table Filling - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the Grok LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok

Name	References	Description
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Table Filling - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the OpenAI LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Text Continuation - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the Gemini LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Text Continuation - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the Grok LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Alter Sentence Structure Scenario Text Continuation - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and alters its sentence structure. The rewritten prompt is then sent to the OpenAI LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Code Completion - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the Gemini LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Code Completion - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the Grok LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Code Completion - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the OpenAI LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI

Name	References	Description
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Text Continuation - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the Gemini LLM to continue a text. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Text Continuation - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the Grok LLM to continue a text. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Text Continuation - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the OpenAI LLM to continue a text. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Table Filling - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the Gemini LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Table Filling - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the Grok LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Insert Meaningless Characters Scenario Table Filling - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and inserts meaningless characters into the prompt. The rewritten prompt is then sent to the OpenAI LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Code Completion - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the Gemini LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini

Name	References	Description
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Code Completion - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the Grok LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Code Completion - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the OpenAI LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Table Filling - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the Gemini LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Table Filling - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the Grok LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Table Filling - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the OpenAI LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Text Continuation - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the Gemini LLM to continue a text. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Text Continuation - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the Grok LLM to continue a text. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Misspell Sensitive Words Scenario Text Continuation - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and misspells sensitive words in the prompt. The rewritten prompt is then sent to the OpenAI LLM to continue a text. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI

Name	References	Description
Strike AI LLM ReNeLLM Paraphrasing Scenario Code Completion - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The rewritten prompt is then sent to the Gemini LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Paraphrasing Scenario Code Completion - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The rewritten prompt is then sent to the Grok LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Paraphrasing Scenario Code Completion - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The rewritten prompt is then sent to the OpenAI LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Paraphrasing Scenario Table Filling - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The rewritten prompt is then sent to the Gemini LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Paraphrasing Scenario Table Filling - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The rewritten prompt is then sent to the Grok LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Paraphrasing Scenario Table Filling - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The rewritten prompt is then sent to the OpenAI LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Paraphrasing Scenario Text Continuation - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The altered prompt is then sent to the Gemini LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini

Name	References	Description
Strike AI LLM ReNeLLM Paraphrasing Scenario Text Continuation - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The altered prompt is then sent to the Grok LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Paraphrasing Scenario Text Continuation - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and paraphrases it with fewer words. The altered prompt is then sent to the OpenAI LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Partial Translation Scenario Code Completion - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translates it. The rewritten prompt is then sent to the Gemini LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Partial Translation Scenario Code Completion - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translates it. The rewritten prompt is then sent to the Grok LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Partial Translation Scenario Code Completion - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translates it. The rewritten prompt is then sent to the OpenAI LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Partial Translation Scenario Table Filling - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translates it. The rewritten prompt is then sent to the Gemini LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Partial Translation Scenario Table Filling - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translates it. The rewritten prompt is then sent to the Grok LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Partial Translation Scenario Table Filling - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translates it. The rewritten prompt is then sent to the OpenAI LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI

Name	References	Description
Strike AI LLM ReNeLLM Partial Translation Scenario Text Continuation - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translate it. The rewritten prompt is then sent to the Gemini LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Partial Translation Scenario Text Continuation - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translate it. The rewritten prompt is then sent to the Grok LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Partial Translation Scenario Text Continuation - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and partially translate it. The rewritten prompt is then sent to the OpenAI LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Style Change Scenario Code Completion - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the Gemini LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Style Change Scenario Code Completion - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the Grok LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Style Change Scenario Code Completion - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the OpenAI LLM to generate a code completion. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Style Change Scenario Table Filling - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the Gemini LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Style Change Scenario Table Filling - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the Grok LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok

Name	References	Description
Strike AI LLM ReNeLLM Style Change Scenario Table Filling - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the OpenAI LLM to fill a table. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM ReNeLLM Style Change Scenario Text Continuation - Gemini		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Gemini LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the Gemini LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Gemini
Strike AI LLM ReNeLLM Style Change Scenario Text Continuation - Grok		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the Grok LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the Grok LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: Grok
Strike AI LLM ReNeLLM Style Change Scenario Text Continuation - OpenAI		This strike sends a Prompt Rewriting and Scenario Nesting (ReNe)-based prompt to the OpenAI LLM. It randomly selects a jailbreak prompt from the ReNeLLM dataset and changes its expression style. The rewritten prompt is then sent to the OpenAI LLM to generate a text continuation. The attack is designed to bypass the LLM's safety mechanisms and generate malicious responses. Target LLM: OpenAI
Strike AI LLM Prompt Injection SMILES-Prompting Substance - Gemini		This strike leverages SMILES (Simplified Molecular-Input Line-Entry System) structural notation to reference chemical substances instead of their conventional names to bypass LLM guardrails and keyword filters, thus providing jailbreak instructions to manipulate its behaviour and in turn, generate synthesis instructions for harmful and/or banned substances. Target LLM: Gemini
Strike AI LLM Prompt Injection SMILES-Prompting Substance - Grok		This strike leverages SMILES (Simplified Molecular-Input Line-Entry System) structural notation to reference chemical substances instead of their conventional names to bypass LLM guardrails and keyword filters, thus providing jailbreak instructions to manipulate its behaviour and in turn, generate synthesis instructions for harmful and/or banned substances. Target LLM: Grok
Strike AI LLM Prompt Injection SMILES-Prompting Substance - OpenAI		This strike leverages SMILES (Simplified Molecular-Input Line-Entry System) structural notation to reference chemical substances instead of their conventional names to bypass LLM guardrails and keyword filters, thus providing jailbreak instructions to manipulate its behaviour and in turn, generate synthesis instructions for harmful and/or banned substances. Target LLM: OpenAI

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Adobe Acrobat JBIG2 Stream Indexing Overflow (SMTP Quoted Printable)	CWE: 119 CVE: 2009-0658 BID: 33751	This strike exploits a stream indexing vulnerability first discovered in Adobe Acrobat when parsing PDF files with malformed JBIG2 streams. This vulnerability is believed to also affect other PDF implementations.
Strike Adobe Acrobat Reader customDictionaryOpen Memory Corruption (SMTP Base64)	CWE: 399 CVE: 2009-1493 BID: 34740	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Adobe Acrobat Reader customDictionaryOpen Memory Corruption (SMTP Quoted Printable)	CWE: 399 CVE: 2009-1493 BID: 34740	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Adobe Acrobat Reader getIcon Memory Corruption (SMTP Base64)	BID: 34169 CWE: 20 CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Adobe Acrobat Reader getIcon Memory Corruption (SMTP Quoted Printable)	BID: 34169 CWE: 20 CVE: 2009-0927	This strike exploits a flaw in Adobe's PDF reader that can result in the execution of arbitrary code.
Strike Adobe Illustrator CS4 .eps Buffer Overflow (SMTP Quoted Printable)	CWE: 119 CVE: 2009-4195 BID: 37192	This strike exploits a vulnerability in the way Adobe Illustrator parses Encapsulated Postscript files containing an overly long strings in a DSC comment, causing a buffer overflow and resulting in possible code execution.
Strike Apple OS X QuickDraw GetSrcBits32ARGB Memory Corruption Denial of Service (SMTP)	BID: 22207 CVE: 2007-0462	This strike exploits a denial of service condition in Apple's Mac OS X when opening a malformed PICT file.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Flip4Mac Memory Corruption (SMTP)	BID: 22286 CVE: 2007-0466	This strike exploits a memory corruption flaw in Telestream Flip4Mac when handling WMF files.
Strike GDIPPlus JPEG Processing Buffer Overrun - SMTP Message	BID: 11173 CVE: 2004-0200	This strike exploits a vulnerability in the processing of JPEG images in multiple Microsoft products based on the GDIPPlus image library. This strike simulates attaching a JPEG to an SMTP message.
Strike Internet Explorer EMF File Rendering Denial of Service (SMTP)	CWE: 399 CVE: 2005-0803 BID: 12834	This strike exploits a denial of service flaw in Microsoft Windows. This flaw is triggered through a malformed Windows EMF Metafile. This strike simulates downloading an EMF file via SMTP.
Strike Internet Explorer WMF File Rendering Denial of Service (SMTP)	CVE: 2005-2124 BID: 15356	This strike exploits a denial of service flaw in Microsoft Windows. This flaw is triggered through a malformed Windows WMF Metafile. This strike simulates downloading an WMF file via SMTP.
Strike Mac OS X DMG UFS ffs_mountfs() Integer Overflow (SMTP)	BID: 21993 CWE: 189 CVE: 2007-0229	This strike transfers a malicious disk image (DMG) file to a Mac OS X target.
Strike Mac OS X Finder DMG Volume Name Memory Corruption (SMTP)	BID: 21980 CWE: 119 CVE: 2007-0197	This transfers a malicious disk image (DMG) file to a Mac OS X target.
Strike Malformed AU File Divide-by-Zero Denial of Service (SMTP)		This strike exploits a denial of service flaw in programs that handle .au files without detecting a divide-by-zero condition
Strike Microsoft Color Management ColorMatchToTarget W (SMTP Quoted Printable)	BID: 30594 CWE: 119 CVE: 2008-2245	This strike exploits a memory corruption vulnerability in the Microsoft Windows Color Management System when handling EMF files with a crafted EMR_COLORMATCHTOTARGETW record.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Excel BIFF Record Parsing Vulnerability (SMTP Base64)	BID: 31705 CWE: 399 CVE: 2008-3471	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing crafted BIFF records.
Strike Microsoft Excel BIFF Record Parsing Vulnerability (SMTP Quoted Printable)	BID: 31705 CWE: 399 CVE: 2008-3471	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing crafted BIFF records.
Strike Microsoft Excel Embedded Object Validation Vulnerability (SMTP Base64)	BID: 31702 CWE: 399 CVE: 2008-3477	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing an embedded object.
Strike Microsoft Excel Embedded Object Validation Vulnerability (SMTP Quoted Printable)	BID: 31702 CWE: 399 CVE: 2008-3477	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing an embedded object.
Strike Microsoft Excel NULL Pointer DoS (A) (SMTP)	BID: 22717 CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Microsoft Excel NULL Pointer DoS (B) (SMTP)	BID: 22717 CVE: 2007-1239	This strike exploits a denial of service flaw in Microsoft Excel using a corrupted XLS document.
Strike Microsoft Excel Obj Record Invalid Subtype Vulnerability (SMTP Base64)	BID: 32621 CWE: 399 CVE: 2008-4264	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing an embedded object with an invalid subtype record.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Excel Obj Record Invalid Subtype Vulnerability (SMTP Quoted Printable)	BID: 32621 CWE: 399 CVE: 2008-4264	This strike exploits a vulnerability in Microsoft Excel when parsing a file containing an embedded object with an invalid subtype record.
Strike Microsoft Excel REPT() Formula Parsing Vulnerability (SMTP Base64)	BID: 31706 CWE: 189 CVE: 2008-4019	This strike exploits a vulnerability in Microsoft Excel when evaluating a REPT() formula with a long number_times parameter.
Strike Microsoft Excel REPT() Formula Parsing Vulnerability (SMTP Quoted Printable)	BID: 31706 CWE: 189 CVE: 2008-4019	This strike exploits a vulnerability in Microsoft Excel when evaluating a REPT() formula with a long number_times parameter.
Strike Microsoft Office Memory Corruption (PowerPoint) (SMTP Base64)	BID: 28146 CWE: 94 CVE: 2008-0118	This strike exploits a memory corruption vulnerability in the Microsoft Office XP PowerPoint component.
Strike Microsoft Office Memory Corruption (PowerPoint) (SMTP Quoted Printable)	BID: 28146 CWE: 94 CVE: 2008-0118	This strike exploits a memory corruption vulnerability in the Microsoft Office XP PowerPoint component.
Strike Microsoft Office Smart Tag WordCount Memory Corruption (SMTP Base64)	BID: 30124 CWE: 399 CVE: 2008-2244	This strike exploits a memory corruption vulnerability in Microsoft Office that is triggered when a Smart Tag structure containing an invalid WordCount value.
Strike Microsoft Office Smart Tag WordCount Memory Corruption (SMTP Quoted Printable)	BID: 30124 CWE: 399 CVE: 2008-2244	This strike exploits a memory corruption vulnerability in Microsoft Office that is triggered when a Smart Tag structure containing an invalid WordCount value.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Office Text Converter Integer Underflow Code Execution (SMTP Direct Quoted Printable)	CVE: 2009-0087	This strike exploits an integer underflow code execution vulnerability in Microsoft Office's text convertor.
Strike Microsoft PowerPoint Master Style Integer Overflow (SMTP Base64)	BID: 30579 CWE: 399 CVE: 2008-1455	This strike exploits a memory corruption vulnerability in Microsoft PowerPoint when opening a file with a malformed Master Style attribute.
Strike Microsoft PowerPoint Master Style Integer Overflow (SMTP Quoted Printable)	BID: 30579 CWE: 399 CVE: 2008-1455	This strike exploits a memory corruption vulnerability in Microsoft PowerPoint when opening a file with a malformed Master Style attribute.
Strike Microsoft PowerPoint TextHeaderAtom Freed Memory Heap Corruption (SMTP Base64)	BID: 34351 CWE: 94 CVE: 2009-0556	This strike exploits a heap memory corruption vulnerability in Microsoft Office's PowerPoint.
Strike Microsoft PowerPoint TextHeaderAtom Freed Memory Heap Corruption (SMTP Quoted Printable)	BID: 34351 CWE: 94 CVE: 2009-0556	This strike exploits a heap memory corruption vulnerability in Microsoft Office's PowerPoint.
Strike Microsoft PowerPoint Viewer 2003 MSODRAWING Property Heap Overflow (SMTP Base64)	BID: 30554 CWE: 399 CVE: 2008-0121	This strike exploits a memory corruption vulnerability in Microsoft PowerPoint Viewer when processing a file with a malformed MSODRAWING Property Table.
Strike Microsoft PowerPoint Viewer 2003 MSODRAWING Property Heap Overflow (SMTP Quoted Printable)	BID: 30554 CWE: 399 CVE: 2008-0121	This strike exploits a memory corruption vulnerability in Microsoft PowerPoint Viewer when processing a file with a malformed MSODRAWING Property Table.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft PowerPoint Viewer 2003 Picture Array Index (SMTP Base64)	BID: 30552 CWE: 399 CVE: 2008-0120	This strike exploits an out-of-bounds array index vulnerability in Microsoft PowerPoint Viewer 2003 when reading malformed PowerPoint files.
Strike Microsoft PowerPoint Viewer 2003 Picture Array Index (SMTP Quoted Printable)	BID: 30552 CWE: 399 CVE: 2008-0120	This strike exploits an out-of-bounds array index vulnerability in Microsoft PowerPoint Viewer 2003 when reading malformed PowerPoint files.
Strike Microsoft Windows Color Management Module ICC Profile Buffer Overflow (SMTP)	CVE: 2005-1219 BID: 14214	Microsoft Windows has a buffer overflow vulnerability in the processing of malformed image files. This strike simulates downloading a JPEG via SMTP.
Strike Microsoft Windows EMF Polylines (SMTP Quoted Printable)	BID: 34012 CWE: 20 CVE: 2009-0081	This strike exploits a vulnerability in Microsoft Windows when parsing an EMF file with crafted EMR_POLYLINE data.
Strike Microsoft Windows GDI Stack Overflow (SMTP Base64)	BID: 28570 CWE: 119 CVE: 2008-1087	This strike sends a file that exploits a stack overflow flaw in GDI, a core component of the Microsoft Windows Graphical User Interface
Strike Microsoft Windows GDI Stack Overflow (SMTP Quoted Printable)	BID: 28570 CWE: 119 CVE: 2008-1087	This strike sends a file that exploits a stack overflow flaw in GDI, a core component of the Microsoft Windows Graphical User Interface
Strike Microsoft Windows LoadImage API Overflow (SMTP)	BID: 12095 CVE: 2004-1049	This strike exploits a flaw in the parsing of images via LoadImage on Microsoft Windows. This strike simulates sending a malicious .ani animated cursor in a SMTP message.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Word 2000 Malformed Function Code Execution (SMTP)	CVE: 2007-0515 BID: 22225	This strike exploits a code execution flaw in Microsoft Word 2000 that is triggered by a malformed function definition.
Strike Microsoft Word Memory Corruption Vulnerability (SMTP) (Arbitrary Free Base64)	CWE: 94 CVE: 2008-4024	This strike exploits a vulnerability in MS Word that allows a malicious document to run 'free()' on an arbitrary address.
Strike Microsoft Word Memory Corruption Vulnerability (SMTP) (Arbitrary Free Quoted Printable)	CWE: 94 CVE: 2008-4024	This strike exploits a vulnerability in MS Word that allows a malicious document to run 'free()' on an arbitrary address.
Strike Microsoft Word Memory Corruption Vulnerability (SMTP) (Array Index Base64)	CWE: 399 CVE: 2008-4026	This strike exploits a vulnerability in MS Word that uses an unchecked offset into an array.
Strike Microsoft Word Memory Corruption Vulnerability (SMTP) (Array Index Quoted Printable)	CWE: 399 CVE: 2008-4026	This strike exploits a vulnerability in MS Word that uses an unchecked offset into an array.
Strike Microsoft Word RTF Object Parsing Vulnerability (SMTP Quoted Printable)	CWE: 399 CVE: 2008-4027	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\do' directives.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpcallout) (SMTP Quoted Printable)	CWE: 119 CVE: 2008-4028	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\dpcallout' directives.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpendgroup) (SMTP Quoted Printable)	CWE: 399 CVE: 2008-4030	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\dpendgroup' directives.
Strike Microsoft Word RTF Object Parsing Vulnerability (dpolycount) (SMTP Quoted Printable)	CWE: 119 CVE: 2008-4025	This strike exploits a vulnerability in MS Word caused by an RTF file with an invalid '\dpolycount' directive.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Microsoft Word RTF Object Parsing Vulnerability (stylesheet) (SMTP Quoted Printable)	CWE: 399 CVE: 2008-4031	This strike exploits a vulnerability in MS Word caused by an RTF file with invalid '\stylesheet' directives.
Strike Microsoft Word Table Property Stack Overflow (SMTP Base64)	CWE: 119 CVE: 2008-4837	This strike exploits a vulnerability in MS Word caused when processing an invalid table property.
Strike Microsoft Word Table Property Stack Overflow (SMTP Quoted Printable)	CWE: 119 CVE: 2008-4837	This strike exploits a vulnerability in MS Word caused when processing an invalid table property.
Strike Microsoft WordPad Embedded COM Code Execution (AddressBook) (SMTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the OutlookExpress.AddressBook COM control into the OLE section of a WordPad RTF document.
Strike Microsoft WordPad Embedded COM Code Execution (InstallEngine) (SMTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the InstallEngine COM control into the OLE section of a WordPad RTF document.
Strike Microsoft WordPad Embedded COM Code Execution (Sysmon.3) (SMTP)		This strike exploits a flaw in Microsoft WordPad that can be used to execute arbitrary code. This particular strike embeds the Sysmon.3 COM control into the OLE section of a WordPad RTF document and defines a set of corrupt OLE properties that will cause a crash on load.
Strike Microsoft Works RTF File Conversion Buffer Overflow (SMTP Base64)	BID: 27659 CWE: 119 CVE: 2008-0108	This strike exploits a buffer overflow in the Microsoft Office and Microsoft Works file converter. A buffer overflow can be triggered when a corrupted Microsoft Works file is converted to the Rich Text Format (RTF).
Strike Microsoft Works RTF File Conversion Buffer Overflow (SMTP Quoted Printable)	BID: 27659 CWE: 119 CVE: 2008-0108	This strike exploits a buffer overflow in the Microsoft Office and Microsoft Works file converter. A buffer overflow can be triggered when a corrupted Microsoft Works file is converted to the Rich Text Format (RTF).

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike VLC Ogg Vorbis Comment Header Format String (SMTP)	BID: 24555  CVE: 2007-3316	This strike exploits a format string vulnerability in VLC when decoding Ogg Vorbis files. This strike simulates sending a malicious file via SMTP.
Strike Windows Explorer.exe AVI Right Click Denial of Service (SMTP)	CVE: 2007-0562	This strike exploits a denial of service condition in Microsoft Windows explorer.exe when right-clicking on a malformed AVI file.
Strike Windows GDI Malformed Image Denial of Service (SMTP)	BID: 25302  CWE: 189  CVE: 2007-3034	This strike exploits a denial-of-service vulnerability in Windows when handling malformed WMF files
Strike Windows OLE32.dll Word Document Handling Denial of Service (SMTP)	CWE: 119  CVE: 2007-1347  BID: 22847	This strike exploits a denial of service condition in Microsoft Windows OLE32.dll when parsing a malicious Word document.
Strike Windows Object Packager Dialogue Spoofing (SMTP)	CWE: 94  CVE: 2006-4692  BID: 20318	This strike exploits a dialogue spoofing flaw in the Windows Object Packager. This flaw allows an attacker to embed a malicious object within a RTF or Microsoft Office document that appears to be a safe file type.
Strike Windows Shortcut Font Name Overflow (SMTP)	CVE: 2005-2118  CVE: 2005-0550  BID: 15070  BID: 13115	This strike exploits two different vulnerabilities in the Windows operating system. The first flaw triggers a stack overflow in the CSrss process when a malformed shortcut is opened. The second flaw triggers a stack overflow in Windows Explorer when the properties of a malformed shortcut file are viewed.
Strike libpng png_handle_sBIT() Local Overflow (SMTP)	BID: 10857  BID: 15495  CVE: 2004-0597	This strike exploits a vulnerability in the processing of PNG images by libpng. This strike simulates sending a PNG via SMTP.

<b>Name</b>	<b>References</b>	<b>Description</b>
Strike Brute Force Attack		Brute-force attacks are techniques that an attacker may employ in order to gain access to accounts. Such techniques involve password spraying and credential stuffing where the attacker is repeatedly trying to find correct credential pairs using small lists of common or known passwords against a list of potential user accounts
Strike URL Filtering	CWE: 790	This strike utilizes special URLs in order to exploit different vulnerabilities.
Strike URL Filtering - Separate Host and Path	CWE: 790	This strike utilizes special URLs in order to exploit different vulnerabilities. When using in a customized attack, make sure to explicitly configure the Host parameter to use the Host column of the same Playlist file as the Path parameter. The Host parameter can be modified from the Attack's Advanced Settings > Connections > Hostname.
Strike Vector HTTP POST	CWE: 89 CWE: 79	Template strike used with a configurable HTTP POST request which can simulate SQL Injection attacks targeting web applications by inserting SQL statements into HTTP request data (such as forms, HTTP headers, URL parameters or message body). These attacks take advantage of unsanitized data to subvert the query executed on the database by inserting SQL statement into HTTP request. This attack contains a collection of SQL Injection payloads coming from multiple public sources and private resources. Cross-Site Scripting (XSS) is a type of computer security vulnerability found in websites that enables attackers to inject scripts into web pages viewed by other users. When these scripts are viewed and executed by other users, they can steal credentials, sensitive data, or modify values or settings on the target website. Reflected XSS (known also as non-persistent XSS) is taking place when the script is not stored on the Web Application side. Typically, the XSS code is spread by sharing a link which is referring a vulnerable web page. The link itself includes the malicious code to execute in web browsers.
Strike SQL Injection and XSS Vector	CWE: 89 CWE: 79	SQL Injection attacks target web applications by inserting SQL statements into HTTP request data (such as forms, HTTP headers or URL parameters). These attacks take advantage of unsanitized data to subvert the query executed on the database by inserting SQL statement into HTTP request. Cross-Site Scripting (XSS) is a type of computer security vulnerability found in websites that enables attackers to inject scripts into web pages viewed by other users. When these scripts are viewed and executed by other users, they can steal credentials, sensitive data, or modify values or settings on the target website. Reflected XSS (known also as non-persistent XSS) is taking place when the script is not stored on the Web Application side. Typically, the XSS code is spread by sharing a link which is referring a vulnerable web page. The link itself includes the malicious code to execute in web browsers. This attack contains a collection of SQL Injection payloads coming from multiple public sources and private resources.

Name	References	Description
Strike Vector Webshell	CWE: 89 CWE: 79	Webshells are malicious scripts that facilitate remote administration once installed on a web server, enabling the execution of malicious commands for a wide range of scenarios: exfiltrating and harvesting information, uploading malware, modifying or adding files. Webshells represent a backdoor into the targeted system, enabling remote attackers to access the host and even move laterally. This strike can be used to simulate a webshell attack by uploading a malicious file on the server.
Strike Vector Webshell Payload	CWE: 89 CWE: 79	Webshells are malicious scripts that facilitate remote administration once installed on a web server, enabling the execution of malicious commands for a wide range of scenarios: exfiltrating and harvesting information, uploading malware, modifying or adding files. Webshells represent a backdoor into the targeted system, enabling remote attackers to access the host and even move laterally. This strike can be used to simulate a webshell attack by uploading a malicious file on the server.

## All Malware Samples (6755)

Name	Description
Strike APTC60_6669d4a8	This strike sends a malware sample known as APTC60. APTC-60 is a threat group that has recently been associated with cyber attacks against Japanese organizations. This malware is part of an attack chain that consists of a phishing email that led to the download of a VHDX file that executes a PE binary and generates a downloader. This downloader then further downloads a backdoor that establishes communication and persistence on the target. The MD5 hash of this APTC60 sample is 6669d4a8a2c9319e1faa80123e6f0d5a.
Strike APTC60_78b4d05a	This strike sends a malware sample known as APTC60. APTC-60 is a threat group that has recently been associated with cyber attacks against Japanese organizations. This malware is part of an attack chain that consists of a phishing email that led to the download of a VHDX file that executes a PE binary and generates a downloader. This downloader then further downloads a backdoor that establishes communication and persistence on the target. The MD5 hash of this APTC60 sample is 78b4d05a7d81b1cd96f1844ce4b201b3.
Strike APTC60_d6a2c8d7	This strike sends a malware sample known as APTC60. APTC-60 is a threat group that has recently been associated with cyber attacks against Japanese organizations. This malware is part of an attack chain that consists of a phishing email that led to the download of a VHDX file that executes a PE binary and generates a downloader. This downloader then further downloads a backdoor that establishes communication and persistence on the target. The MD5 hash of this APTC60 sample is d6a2c8d7a5546de3b5eaa1c92865d001.
Strike AceCryptor_0b7af822	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 0b7af822f9c85668d446d0d6d26903cb.

<b>Name</b>	<b>Description</b>
Strike AceCryptor_10a08ec8	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 10a08ec8fd17e9b73e62568d5ab8a9b3.
Strike AceCryptor_26ba1146	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 26ba1146f36c3703f94ce7e5602cd3da.
Strike AceCryptor_2cb2a55a	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 2cb2a55af83803b57caa53a21dec20b0.
Strike AceCryptor_454dc3fc	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 454dc3fc0921ce440ec8780b8e5992fb.
Strike AceCryptor_47bf6bfc	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 47bf6bfc52defe05b87d0e04e3d92c45.
Strike AceCryptor_49800f6e	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 49800f6e90bf6019da4a13639032642f.
Strike AceCryptor_59eec747	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 59eec747286f1e89ce96fef39f9de3e5.
Strike AceCryptor_5b2f54fb	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 5b2f54fbca30e9a282f3d8b461e03a17.

<b>Name</b>	<b>Description</b>
Strike AceCryptor_5cb1682f	This strike sends a polymorphic malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this AceCryptor sample is 5cb1682f8281d6e72463f74336ebe258.
Strike AceCryptor_5ea12c54	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 5ea12c54a54b31b61629188545e432cc.
Strike AceCryptor_634b1183	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 634b1183d01be4d8ffb806a4827ed879.
Strike AceCryptor_6c90215b	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 6c90215b8a560ecb2f5f2430b1f2e016.
Strike AceCryptor_6e243f38	This strike sends a polymorphic malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this AceCryptor sample is 6e243f384f7c494c284fe4113d7d8c8a.
Strike AceCryptor_79871e44	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 79871e44f79f36393c2c9beb8e366125.
Strike AceCryptor_7abe5257	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 7abe5257dbe779a37c1715a3d8e2bd9d.

<b>Name</b>	<b>Description</b>
Strike AceCryptor_7e1d6a44	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 7e1d6a44d1cf118a3752e17972a4d69c.
Strike AceCryptor_804bf188	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 804bf188fd3fd4d9afdbc1ff0d020cda.
Strike AceCryptor_8741c48f	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 8741c48f70c18d6337558bbd676f5a0d.
Strike AceCryptor_8b9b33a5	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 8b9b33a5183fde571a18583844432eb3.
Strike AceCryptor_8dbdef61	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 8dbdef6108e6b202ecc0570c9e96d76b.
Strike AceCryptor_9d5512a5	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is 9d5512a57dfdc484cb7ee15668ab6e22.
Strike AceCryptor_b95b574d	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is b95b574d4233b2cbc00ad5bc0e1721e7.
Strike AceCryptor_cc492729	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is cc492729431765a9bc9cbf54625a6dac.

<b>Name</b>	<b>Description</b>
Strike AceCryptor_e320bb75	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is e320bb753ba6fb13ea7ef15e7efc315e.
Strike AceCryptor_e9cb900e	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is e9cb900e57154d6469dae21c82a1753b.
Strike AceCryptor_f18129ea	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is f18129ea81b3b5690cf1300397db51e.
Strike AceCryptor_f22089ec	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is f22089ecc61519c668e9f7ae4f0fe372.
Strike AceCryptor_f9027bda	This strike sends a polymorphic malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The binary has the checksum removed in the PE file format. The MD5 hash of this AceCryptor sample is f9027bdaa0eb5a4017a16f6e2d50f5f1.
Strike AceCryptor_fa0ce1b2	This strike sends a polymorphic malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this AceCryptor sample is fa0ce1b21f49a9bcb382759a5052ec1c.
Strike AceCryptor_fcf22de7	This strike sends a polymorphic malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The binary has random bytes appended at the end of the file. The MD5 hash of this AceCryptor sample is fcf22de7f4cb40a21878236aecb0687c.

<b>Name</b>	<b>Description</b>
Strike AceCryptor_fe1cfddb	This strike sends a malware sample known as AceCryptor. AceCryptor is a cryptor-as-a-service that is used to pack numerous malware families. These samples are part of an email campaign that delivered the cryptor as a malicious attachment. It contains an iso file or archive that once executed unpacks and launches the Rescoms , also known as Remcos, RAT. The MD5 hash of this AceCryptor sample is fe1cfddb7b44cec0b5c37769934a2ee9.
Strike AcidRain_ecbe1b1e	This strike sends a malware sample known as AcidRain. AcidRain is a wiper malware associated with the Russian invasion of Ukraine, and was used in 2022 in an attack against Viasat modems. It is a MIPS ELF binary that performs a wipe of the target filesystem. The malware also shares some common linked libraries with the VPNFilter plugin , 'dstr', which was meant to wipe devices. The MD5 hash of this AcidRain sample is ecbe1b1e30a1f4bfffaf1d374014c877f.
Strike Adrozek_022fd996	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 022fd9966a974597ef3ea8a2053eebab.
Strike Adrozek_12168815	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 12168815ad176df39aac31d8680e8e63.
Strike Adrozek_195cbbfd	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 195cbbfd4bb76b0fe346ad80df06f627.
Strike Adrozek_2ad72cab	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 2ad72cab2e2307bc31d2796f9b860f9f.
Strike Adrozek_37c8cd08	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 37c8cd0861e71380adf860424819b9f2.
Strike Adrozek_3ff3ab8e	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 3ff3ab8ea667738e005cb419c51d1960.
Strike Adrozek_4c0b0223	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 4c0b0223e8703e5347038ca240c8f703.
Strike Adrozek_512870c5	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 512870c58ca92bf9cf31969e6ff95233.
Strike Adrozek_55499c0c	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 55499c0c9d2df98f821ed55071f5bc1c.

<b>Name</b>	<b>Description</b>
Strike Adrozek_55dd45f4	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 55dd45f49c6f87bc0e838313e29ed47f.
Strike Adrozek_68fc74f9	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 68fc74f99d0665401261f7cb9d5967db.
Strike Adrozek_6ab15660	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 6ab15660f883d6c313a84f3092c2af7c.
Strike Adrozek_76dc151b	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 76dc151b8ef17e2b51180919e40e3d7f.
Strike Adrozek_807592e6	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 807592e6eb531ffeb53a27c0f62b71b7.
Strike Adrozek_85120da5	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 85120da5492577b6e462bcaf567302c5.
Strike Adrozek_85172625	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 8517262559ecf71f29621ba6a2fa79e9.
Strike Adrozek_88bcf085	This strike sends a malware sample known as Adrozek. Adrozek hooks into web browsers to inject ads on webpages and steals login credentials when users visit the webpage. The MD5 hash of this Adrozek sample is 88bcf0852d8b458e5629596ef0c7871b.

It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has the signature removed in the PE file format. The MD5 hash of this AsukaStealer sample is 4a4943d11594b94332f9e6e79f509f6e.
Strike AsukaStealer_515e77da	This strike sends a polymorphic malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this AsukaStealer sample is 515e77da1ddd282b054a40a0c93fb9e2.
Strike AsukaStealer_7ce0bd10	This strike sends a malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The MD5 hash of this AsukaStealer sample is 7ce0bd101d349bc88b668e380093e1a9.
Strike AsukaStealer_7da46b7c	This strike sends a polymorphic malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has the debug flag removed in the PE file format. The MD5 hash of this AsukaStealer sample is 7da46b7c9e2053d1f0e7ed588a58faf3.
Strike AsukaStealer_845dc635	This strike sends a polymorphic malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this AsukaStealer sample is 845dc6356a8e7ffc6fc21e30ca54478a.
Strike AsukaStealer_8580a630	This strike sends a polymorphic malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this AsukaStealer sample is 8580a6307bb564e8b3613b542718872d.
Strike AsukaStealer_9ce2a046	This strike sends a malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The MD5 hash of this AsukaStealer sample is 9ce2a046a0698212c2963f2df91ff2e1.

<b>Name</b>	<b>Description</b>
Strike AsukaStealer_9db4859f	This strike sends a polymorphic malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has been packed using upx packer, with the default options. The MD5 hash of this AsukaStealer sample is 9db4859f339604dc474eb87407535480.
Strike AsukaStealer_e860e2e9	This strike sends a polymorphic malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this AsukaStealer sample is e860e2e91ffe0db44e044bb777cb884e.
Strike AsukaStealer_e9dda8cc	This strike sends a malware sample known as AsukaStealer. AsukaStealer is infostealer malware that is offered as Malware-as-a-services (MaaS). It is designed to collect data from browsers, Discord tokens, FileZilla and Telegram sessions, crypto wallets, and desktop screenshots. The MD5 hash of this AsukaStealer sample is e9dda8ccde5385e8d0a7f0bdc361e51d.
Strike AsyncRAT_07f3f073	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 07f3f073391f7308ca1c7ef54d6c5656.
Strike AsyncRAT_0a80a592	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 0a80a592d407a2a8b8b318286dc30769.
Strike AsyncRAT_0a82a328	This strike sends a malware sample known as AsyncRAT. AsyncRAT is a malware that uses WSF script format and is distributed through compressed (.zip) files via email URLs. The malware exhibits sophisticated evasion techniques by disguising itself within a .jpg file. Upon execution, it deploys a series of scripts, including Visual Basic, PowerShell, and a final .NET binary (AsyncRAT). Key capabilities of the malware involve persistence through scheduled tasks and registry entries, information exfiltration encompassing computer details, browser user data, and cryptocurrency wallet information. The C2 server, encrypted within the file, orchestrates data exfiltration. The MD5 hash of this AsyncRAT sample is 0a82a32801a0a2c1bcf4371a4a582f5e.

Strike AuKill_42bc883e	This strike sends a malware sample known as AuKill. AuKill is a defensive evasion tool that takes advantage of a legitimate but outdated driver used in the Process Explorer tool to disable EDR processes. This tool has been seen in conjunction with the deployment of the Medusa Locker ransomware and the Lockbit ransomware. The MD5 hash of this AuKill sample is 42bc883e7a31b011d2687eba178c2525.

<b>Name</b>	<b>Description</b>
Strike AuKill_811bd70a	This strike sends a malware sample known as AuKill. AuKill is a defensive evasion tool that takes advantage of a legitimate but outdated driver used in the Process Explorer tool to disable EDR processes. This tool has been seen in conjunction with the deployment of the Medusa Locker ransomware and the Lockbit ransomware. The MD5 hash of this AuKill sample is 811bd70aa6d099716b49794870c07b7d.
Strike BQTLock_058a1dbf	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 058a1dbfa03cac6cc67d34a4dcc69445.
Strike BQTLock_110df495	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 110df49522d46b612a28bafbdff3405c.
Strike BQTLock_3478194a	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 3478194a509ae4d2f0a31435952b27bc.
Strike BQTLock_69e6fa25	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 69e6fa25e66c23121826805bbcb890ac.
Strike BQTLock_84c7bfb0	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is 84c7bfb0e243dd99b674e48701acob6b.

Strike BQTLock_d6cb9f18	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is d6cb9f18705c34c515dbfd59c4015576.
Strike BQTLock_dae6729c	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is dae6729cc3bfcbd700fc7e46818aada2.
Strike BQTLock_e73abc48	This strike sends a malware sample known as BQTLock. BQTLock is a ransomware that encrypts files on the victim's system and demands a ransom to decrypt them. It is delivered via phishing emails, malicious downloads, or exploit kits. Once executed, BQTLock encrypts the victim's files using AES-256 encryption and changes the filenames to ".bqt" extension. Its key capabilities include encryption of files, changing file extensions, and demanding a ransom in exchange for decryption. The MD5 hash of this BQTLock sample is e73abc48015c54214b2edae4a6d1ed25.

<b>Name</b>	<b>Description</b>
Strike BabbleLoader_30525477	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is 30525477955ce3dc73af96fbf4dcdd42.
Strike BabbleLoader_46f556b2	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is 46f556b28535ffd8ed4ae44eb1d9a3b2.
Strike BabbleLoader_5d31204e	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is 5d31204e8c9a6e35d5534a730781c691.
Strike BabbleLoader_63f4bd22	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is 63f4bd224289327bea085cb2e16cea49.
Strike BabbleLoader_7db7cc8f	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is 7db7cc8f9bac5ee1a27f9ea7d4e75f5c.
Strike BabbleLoader_a1e2907b	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is a1e2907beb8e073c75eaff5fc4dd732.
Strike BabbleLoader_dc5944bc	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is dc5944bc1a3c90bc6d790e56d2faa026.
Strike BabbleLoader_dfc7d90f	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is dfc7d90fcfd68da15d0552e76f6981972.
Strike BabbleLoader_ef954119	This strike sends a malware sample known as BabbleLoader. BabbleLoader is a malware loader that is designed to bypass antivirus and sandbox environments to inject the malware into memory. This loader includes lots of junk code and ways to confuse and mislead AI detection mechanisms. The MD5 hash of this BabbleLoader sample is ef95411945330db1907508d38bc373ac.

<b>Name</b>	<b>Description</b>
Strike Babuk Locker_024382ee	This strike sends a malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The MD5 hash of this Babuk Locker sample is 024382eef9abab8edd804548f94b78fc.
Strike Babuk Locker_4161cbe9	This strike sends a malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The MD5 hash of this Babuk Locker sample is 4161cbe9722d98ffe53636e9efa874ca.
Strike Babuk Locker_567c8369	This strike sends a malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The MD5 hash of this Babuk Locker sample is 567c8369e6ab695c9d65a629d6f45710.
Strike Babuk Locker_61bf40aa	This strike sends a polymorphic malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Babuk Locker sample is 61bf40aa7be7bac60efcec70058af30b.
Strike Babuk Locker_a8c465b9	This strike sends a polymorphic malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The binary has the debug flag removed in the PE file format. The MD5 hash of this Babuk Locker sample is a8c465b971bb6ccfc517cf132a97f16d.
Strike Babuk Locker_b8e5bd86	This strike sends a malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The MD5 hash of this Babuk Locker sample is b8e5bd86046b596d8cf43843f433bb5d.
Strike Babuk Locker_cafe07d8	This strike sends a malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The MD5 hash of this Babuk Locker sample is cafe07d8c34108007372bd8df42d9ef9.
Strike Babuk Locker_cb95970a	This strike sends a polymorphic malware sample known as Babuk Locker. Babuk is a ransomware that first started appearing in early 2021. Recently a tool that was used in the creation of these ransomware samples has been detected in other attacks and is being called Babuk Locker. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Babuk Locker sample is cb95970ab2c06f8695a4741fe055ec25.

Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 18ff7d29a2beb92634eab27f2b39ceec.
Strike BadSpace_1ac17baf	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 1ac17baf9e0214f3fb270afa7a871153.
Strike BadSpace_1b7b6fb1	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 1b7b6fb1a99996587a3c20ee9c390a9c.
Strike BadSpace_1b7f494c	This strike sends a malware sample known as BadSpace. BadSpace is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 1b7f494c383385d9f76d17e5a9d757d3.
Strike BadSpace_1e327a54	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 1e327a54d1d87af79bf04b1776a8c2af.
Strike BadSpace_1f2912c0	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 1f2912c0c12b316023061de20ee3cc55.

Strike BadSpace_29a6a816	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 29a6a8168d2c83d516964ace53458cff.
Strike BadSpace_2a463fe7	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 2a463fe704d5fbd299fa3315ea13b932.
Strike BadSpace_2c9aefc2	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 2c9aefc29c58618f86cf2ea1cd9c132f.
Strike BadSpace_3368a6df	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 3368a6dfd36f34671974b1e43521bf84.
Strike BadSpace_33cea9af	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 33cea9af8f22e5048b96413dc238c492.
Strike BadSpace_342dc118	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 342dc118538238a22829e7ceaf68d4ac.

<b>Name</b>	<b>Description</b>
Strike BadSpace_36039d4d	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 36039d4d4ec73620db0835201b85fc6e.
Strike BadSpace_3746c798	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 3746c798fa14f67d2426def475bc23a6.
Strike BadSpace_3849f4bc	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 3849f4bcef666a762e5f2c80c526f20e.
Strike BadSpace_389b784c	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 389b784c2ce97c05465da71cecd03c9b.
Strike BadSpace_3c7511cc	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 3c7511cc20744b39290929ee13249a03.
Strike BadSpace_3c8c64c7	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 3c8c64c782fb70528f45446f61cd5e5.

<b>Name</b>	<b>Description</b>
Strike BadSpace_3c90fd1d	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this BadSpace sample is 3c90fd1d6857aaeb535515b569631a71.
Strike BadSpace_3dab3a34	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 3dab3a340acdad73f5551715e76624eb.
Strike BadSpace_404ab87b	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 404ab87bbf07bd21c8a2438c22e77649.
Strike BadSpace_417119be	This strike sends a malware sample known as BadSpace. BadSpace is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 417119be6153068e59bc0e9a85c0c0ee.
Strike BadSpace_42a14390	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 42a1439065f37691796551faa853d88.
Strike BadSpace_4594f36c	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is 4594f36c836442205c358013ce523c12.

Strike BadSpace_dfc08e40	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is dfc08e405abb187a4b9d120f31ab6b30.
Strike BadSpace_e49e35d6	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is e49e35d6838821efed91d1c403d6e4a1.
Strike BadSpace_e4f5640c	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is e4f5640cdfcff41a7f6b23d4dd3cf9a4.
Strike BadSpace_ec534a65	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is ec534a6532a3d0bcb0aca0254baa1b94.
Strike BadSpace_edcaaeb7	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is edcaaeb77d6ea4869333902e2af61ac2.
Strike BadSpace_ef401948	This strike sends a malware sample known as BadSpace. BadSpace is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is ef401948a5d0428c328ea1454d2f92fb.

Strike BadSpace_efafa11c	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is efafa11c77ea43b6e06f342448295115.
Strike BadSpace_efc73651	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is efc7365134a29bbcd549aa262fcdad1c.
Strike BadSpace_f1251f37	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is f1251f37e80bc18e7d6b7e8ee2180b09.
Strike BadSpace_f2a40149	This strike sends a malware sample known as BadSpace. BadSpace is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is f2a4014997dd068bbe3eccceb482d21f.
Strike BadSpace_f3f654d3	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is f3f654d3cc395793f7f31c709b264c1c.
Strike BadSpace_f47f5f4a	This strike sends a malware sample known as BadSpace. BadSpace also known as WarmCookie is a backdoor malware that is delivered via infected websites. Once downloaded and infected the malware opens up C2 communication with a remote server using the target specific information to encrypt the data being sent. The malware supports several commands from the remote server including the ability to take a screenshot, execute commands, and read and write files. The MD5 hash of this BadSpace sample is f47f5f4a8d87b0e62f9c7104ff9a2845.
