Strike Bandidos_038de761	This strike sends a malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The MD5 hash of this Bandidos sample is 038de761c002ae546870035be143a736.
Strike Bandidos_06d613cc	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random bytes appended at the end of the file. The MD5 hash of this Bandidos sample is 06d613ccf59608145e0ef7235f9ff4c6.
Strike Bandidos_0f31bba7	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random bytes appended at the end of the file. The MD5 hash of this Bandidos sample is 0f31bba7e0fe074a70230e5504ab1bc0.
Strike Bandidos_10c4865e	This strike sends a malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The MD5 hash of this Bandidos sample is 10c4865edac377dc12f14905c8bb3a46.
Strike Bandidos_2d9afda2	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Bandidos sample is 2d9afda2d563179aa8230116f916d227.

<b>Name</b>	<b>Description</b>
Strike Bandidos_3015f878	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Bandidos sample is 3015f8785e0aa11d0cc1eadfe6112916.
Strike Bandidos_4ba8ccbd	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has been packed using upx packer, with the default options. The MD5 hash of this Bandidos sample is 4ba8ccbd73a0951cab9c156fea290a70.
Strike Bandidos_4dc64170	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Bandidos sample is 4dc6417077e498a189e40dde2efd41da.
Strike Bandidos_64acb89a	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Bandidos sample is 64acb89ad84db2d5f2bad354ad547417.
Strike Bandidos_695ebe3e	This strike sends a malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The MD5 hash of this Bandidos sample is 695ebe3e45a89552d7dabbc2b972ed66.

<b>Name</b>	<b>Description</b>
Strike Bandidos_78cb7d1e	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Bandidos sample is 78cb7d1e62e3340825e8db41e752bdb8.
Strike Bandidos_808ffbe3	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Bandidos sample is 808ffbe38c037d877279779ea356e0a4.
Strike Bandidos_80bda1f2	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Bandidos sample is 80bda1f2647c16ed8050162359401c28.
Strike Bandidos_86657996	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Bandidos sample is 866579961556526d991a5917a5adc665.
Strike Bandidos_998462a8	This strike sends a polymorphic malware sample known as Bandidos. Recently this campaign was largely found targeting Venezuela and Spanish speaking countries. Infection occurs when malicious emails are sent with a PDF document to their victims. Once the PDF is opened and the link clicked an archive is retrieved with a dropper that injects Bandook into Internet Explorer. The Bandidos payload has many features including manipulating files, taking screenshots, controlling the user cursor on screen, installing additional DLLs, uninstalling itself, and exfiltrating data. This sample is the Dropper. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Bandidos sample is 998462a846d496b57b30b5f39ee118b0.

This malware uses custom kernel drivers to evade detection. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Banload sample is aa0220fc966bd466016cb8d43aa157e9.
Strike Banload_ab0d89d2	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is ab0d89d2a3aae61867d2f74734247be4.
Strike Banload_b0f6797f	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is b0f6797f35d9b0845d0208b5ee2b2d95.
Strike Banload_b49b6484	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is b49b64848bec6f371a87bb3299289fe6.
Strike Banload_b942612e	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is b942612eebef0bf2cc17e649da42f645.

<b>Name</b>	<b>Description</b>
Strike Banload_c2076b76	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is c2076b766832250f6a662167587ff22f.
Strike Banload_c4d27160	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is c4d27160fcce47b741bb2dad01d63b20.
Strike Banload_c6780923	This strike sends a polymorphic malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The binary has the checksum removed in the PE file format. The MD5 hash of this Banload sample is c6780923def330192f69eb7826249c62.
Strike Banload_c8181d11	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is c8181d11545ed27d3942832216d2baa8.
Strike Banload_d93d32b2	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is d93d32b2df1365aba50a850cdcf9ac41.
Strike Banload_dc2c2460	This strike sends a polymorphic malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Banload sample is dc2c2460f88c67ba4596bdfb34b2cbac.
Strike Banload_deaf3862	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is deaf38621cc351ca073766c3217631d0.
Strike Banload_e3117df8	This strike sends a polymorphic malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Banload sample is e3117df8ed16e72bf66ef6b10e5e9b02.
Strike Banload_f9295e9d	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is f9295e9d59544554999c80a0be5ea322.
Strike Banload_f9606989	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is f9606989388e71a12e1fb6e0ee1b7210.

<b>Name</b>	<b>Description</b>
Strike Banload_fa2ac90f	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is fa2ac90fe8bbfa7a11b40f18bf21045c.
Strike Banload_fbed3502	This strike sends a malware sample known as Banload. Banload is a banking trojan that has recently been infecting Latin American systems. This malware uses custom kernel drivers to evade detection. The MD5 hash of this Banload sample is fbed3502397bc90ac4008f6593c666a6.
Strike Barys_006a7221	This strike sends a malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The MD5 hash of this Barys sample is 006a72219afabff2f56695f413ca43db.
Strike Barys_1aeb9636	This strike sends a malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The MD5 hash of this Barys sample is 1aeb9636011a15736fa535f7d3ba7f9d.
Strike Barys_20d6e9bb	This strike sends a malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The MD5 hash of this Barys sample is 20d6e9bb4eb08715b9c14437b90c059d.
Strike Barys_2775ccd0	This strike sends a polymorphic malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The binary has a new section added in the PE file format with random contents. The MD5 hash of this Barys sample is 2775ccd010831c057c8d3c822adf7fc3.
Strike Barys_2f511a1d	This strike sends a polymorphic malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Barys sample is 2f511a1df6582dea8340fd62e27c9f3e.
Strike Barys_36642d69	This strike sends a malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The MD5 hash of this Barys sample is 36642d69e2d734c634e8fa854e54ecae.
Strike Barys_3c11a2bd	This strike sends a polymorphic malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Barys sample is 3c11a2bd2d5f1c68588dd60b742008f1.
Strike Barys_6a191144	This strike sends a polymorphic malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The binary has random bytes appended at the end of the file. The MD5 hash of this Barys sample is 6a191144dc2744c0d803461b8b35336b.
Strike Barys_c594feb4	This strike sends a polymorphic malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The binary has random bytes appended at the end of the file. The MD5 hash of this Barys sample is c594feb41863cd0726eadf0e1c376ee6.

<b>Name</b>	<b>Description</b>
Strike Barys_d1365296	This strike sends a polymorphic malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Barys sample is d1365296a329a50b6d389373aa50fa01.
Strike Barys_f7298f17	This strike sends a malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The MD5 hash of this Barys sample is f7298f1722540763da5a2e2c82368b25.
Strike Barys_f815281e	This strike sends a malware sample known as Barys. Barys is a trojan and downloader that will upload malicious files to the victim machine. The MD5 hash of this Barys sample is f815281ed4b16169e0b474dbac612bbc.
Strike BazaLoader_034e2d69	This strike sends a polymorphic malware sample known as BazaLoader. BazaLoader is a modular malware loader with the purpose to deliver additional malware. Most recently BazaLoader campaigns have been detected delivering email and document lures related to Valentine's Day. The binary file has one more imports added in the import table. The MD5 hash of this BazaLoader sample is 034e2d6983dfcd827b99f8592aba6acf.
Strike BazaLoader_3c9d6dd0	This strike sends a polymorphic malware sample known as BazaLoader. BazaLoader is a modular malware loader with the purpose to deliver additional malware. Most recently BazaLoader campaigns have been detected delivering email and document lures related to Valentine's Day. The binary has the timestamp field updated in the PE file header. The MD5 hash of this BazaLoader sample is 3c9d6dd012f71a9d021227ef35c593d4.
Strike BazaLoader_50a737ac	This strike sends a malware sample known as BazaLoader. BazaLoader is a modular malware loader with the purpose to deliver additional malware. Most recently BazaLoader campaigns have been detected delivering email and document lures related to Valentine's Day. The MD5 hash of this BazaLoader sample is 50a737acebc342a7d5bdca05419c1564.
Strike BazaLoader_66a795a6	This strike sends a polymorphic malware sample known as BazaLoader. BazaLoader is a modular malware loader with the purpose to deliver additional malware. Most recently BazaLoader campaigns have been detected delivering email and document lures related to Valentine's Day. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this BazaLoader sample is 66a795a6c30b329d358293a47ad02de5.
Strike BazaLoader_8ef02674	This strike sends a polymorphic malware sample known as BazaLoader. BazaLoader is a modular malware loader with the purpose to deliver additional malware. Most recently BazaLoader campaigns have been detected delivering email and document lures related to Valentine's Day. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this BazaLoader sample is 8ef02674c322336d04f054f470eea0ce.
Strike BazarLoader_1d528a2e	This strike sends a malware sample known as BazarLoader. BazarLoader is a malware loader with the function to install and download additional malware. This sample of BazarLoader is Nim-compiled to make detection more difficult. The MD5 hash of this BazarLoader sample is 1d528a2e1d0a097421e57f86ba04e79f.

<b>Name</b>	<b>Description</b>
Strike BazarLoader_4faef841	This strike sends a malware sample known as BazarLoader. BazarLoader is a malware loader with the function to install and download additional malware like Trickbot or Ryuk. The MD5 hash of this BazarLoader sample is 4faef8417a45888b6a1b8ddadd4332c8.
Strike BazarLoader_6b77b33b	This strike sends a malware sample known as BazarLoader. BazarLoader is a malware loader with the function to install and download additional malware like Trickbot or Ryuk. The MD5 hash of this BazarLoader sample is 6b77b33b880eda3a3527d489fb213d97.
Strike BazarLoader_a8e44d19	This strike sends a malware sample known as BazarLoader. BazarLoader is a malware loader with the function to install and download additional malware like Trickbot or Ryuk. The MD5 hash of this BazarLoader sample is a8e44d190da9ca504c12f576fa9a417a.
Strike BazarLoader_aedbdc94	This strike sends a malware sample known as BazarLoader. BazarLoader is a malware loader with the function to install and download additional malware like Trickbot or Ryuk. The MD5 hash of this BazarLoader sample is aedbdc94d6c5cf73533f71ea8b5f5eea.
Strike BazarLoader_f6da98fd	This strike sends a malware sample known as BazarLoader. BazarLoader is a malware loader with the function to install and download additional malware like Trickbot or Ryuk. The MD5 hash of this BazarLoader sample is f6da98fd1bbbf7e2c0c5ef0718380e61.
Strike BeaverTail_19fed025	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. The MD5 hash of this BeaverTail sample is 19fed025bf280190948a4c14a9ff8786.
Strike BeaverTail_4b5fdb56	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. The MD5 hash of this BeaverTail sample is 4b5fdb56a090de9ff532764c3f817183.
Strike BeaverTail_4eaefb2f	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. The MD5 hash of this BeaverTail sample is 4eaefb2fc78df5118aa943301b57391b.

<b>Name</b>	<b>Description</b>
Strike BeaverTail_55430683	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. The MD5 hash of this BeaverTail sample is 554306835785d730a6bddbc68e12d3f0.
Strike BeaverTail_564a7352	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. The MD5 hash of this BeaverTail sample is 564a73529560821b21fe576ee642dd70.
Strike BeaverTail_5f6a62a0	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. The MD5 hash of this BeaverTail sample is 5f6a62a09c0f5dce9d99740d5d1a52b8.
Strike BeaverTail_6c36176f	This strike sends a malware sample known as BeaverTail. BeaverTail is a JavaScript-based malware distributed through Node Package Manager (NPM) packages. The malware serves as an information stealer targeting cryptocurrency wallets and credit card details. It also acts as a loader for the subsequent malware, InvisibleFerret. It is heavily obfuscated and often injected into legitimate NPM projects and requires human interaction for execution, contributing to its evasion tactics. Once installed on any cross-platform it collects system information and searches for browser extensions associated with cryptocurrency wallets. Strike Bellingcat_b4f10039	This strike sends a malware sample known as Bellingcat. The malware sample belongs to a Russian APT group that uses spear-phishing messages to target specific entities. The attack uses a NASA-themed tactic, which delivers a ZIP file containing an LNK file disguised as a PDF. The LNK file executes a PowerShell script to decode and execute a Base64-encoded command, deploying the HTTP-Shell multi-platform reverse shell. The shell is capable of file upload/download and C&C communication, aimed to mimic legitimate activity for stealth. The MD5 hash of this Bellingcat sample is b4f10039927b040f0470b956c74a31b4.
Strike Bellingcat_b58d686f	This strike sends a malware sample known as Bellingcat. The malware sample belongs to a Russian APT group that uses spear-phishing messages to target specific entities. The attack uses a NASA-themed tactic, which delivers a ZIP file containing an LNK file disguised as a PDF. The LNK file executes a PowerShell script to decode and execute a Base64-encoded command, deploying the HTTP-Shell multi-platform reverse shell. The shell is capable of file upload/download and C&C communication, aimed to mimic legitimate activity for stealth. The MD5 hash of this Bellingcat sample is b58d686f1c6c124ccd8d5fab08638ec8.
Strike Bellingcat_bf8a44df	This strike sends a malware sample known as Bellingcat. The malware sample belongs to a Russian APT group that uses spear-phishing messages to target specific entities. The attack uses a NASA-themed tactic, which delivers a ZIP file containing an LNK file disguised as a PDF. The LNK file executes a PowerShell script to decode and execute a Base64-encoded command, deploying the HTTP-Shell multi-platform reverse shell. The shell is capable of file upload/download and C&C communication, aimed to mimic legitimate activity for stealth. The MD5 hash of this Bellingcat sample is bf8a44df0ea8e72cf03237e166f414a7.

<b>Name</b>	<b>Description</b>
Strike Bellingcat_eaec51e0	This strike sends a malware sample known as Bellingcat. The malware sample belongs to a Russian APT group that uses spear-phishing messages to target specific entities. The attack uses a NASA-themed tactic, which delivers a ZIP file containing an LNK file disguised as a PDF. The LNK file executes a PowerShell script to decode and execute a Base64-encoded command, deploying the HTTP-Shell multi-platform reverse shell. The shell is capable of file upload/download and C&C communication, aimed to mimic legitimate activity for stealth. The MD5 hash of this Bellingcat sample is eaec51e070790ef819e7837b880acf0a.
Strike Bellingcat_f2bc317c	This strike sends a malware sample known as Bellingcat. The malware sample belongs to a Russian APT group that uses spear-phishing messages to target specific entities. The attack uses a NASA-themed tactic, which delivers a ZIP file containing an LNK file disguised as a PDF. The LNK file executes a PowerShell script to decode and execute a Base64-encoded command, deploying the HTTP-Shell multi-platform reverse shell. Strike Bifrost_025d7085	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 025d7085a1091019ca20a9765c0aaeb8.
Strike Bifrost_04e53cad	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 04e53cad12c002afe77882e0b1d6ce6a.
Strike Bifrost_0d1327d2	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Bifrost sample is 0d1327d2a2b0a068192d16b5b75b9e10.
Strike Bifrost_11ac73b0	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 11ac73b0ffdf22b9b329bfddf215ed83.
Strike Bifrost_1208f352	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 1208f3526e1cd37fa37017c07bda23e9.

<b>Name</b>	<b>Description</b>
Strike Bifrost_1216aa41	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Bifrost sample is 1216aa4137de1ab5dd6941072e4dfbb7.
Strike Bifrost_175db028	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 175db028ffcd0b6c109d80b3d9cfa06f.
Strike Bifrost_188de6b9	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 188de6b94cd471e27fb24bae4ffddef1.
Strike Bifrost_19f419d8	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 19f419d85734514f263386cb75a3fd23.
Strike Bifrost_1acfcede	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Bifrost sample is 1acfcede2b9e9d76d699f401e2c7ffe2.
Strike Bifrost_2660414d	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 2660414d630a3c751741356fc39e6976.
Strike Bifrost_28c3852d	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 28c3852dadec6b0a094560110dff9d90.
Strike Bifrost_2b7726fa	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 2b7726fa3e1695bce3a95d8222ebaf07.

<b>Name</b>	<b>Description</b>
Strike Bifrost_2bcd1b5	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 2bcd1b533f88165e5ef0da754517536.
Strike Bifrost_2d909a3d	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 2d909a3d5efa68b5d8b2553db1c13e7f.
Strike Bifrost_2f0c11af	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 2f0c11af00219f9eec567c45a1ae97ff.
Strike Bifrost_313e9588	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 313e958863a7e7577a6c677c17d4ddff.
Strike Bifrost_31d773b4	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Bifrost sample is 31d773b42bd89af8689182e72170cbf4.
Strike Bifrost_3782d221	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 3782d2215918964a26919546a73600fe.
Strike Bifrost_37c49bbd	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 37c49bbd0788943d753638da6ee74b69.
Strike Bifrost_399c3a89	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 399c3a89a43ab12f22d0218a717355ec.

<b>Name</b>	<b>Description</b>
Strike Bifrost_3f548dd8	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 3f548dd8eeb144a6f0d35277083b5b39.
Strike Bifrost_401423b3	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 401423b33f7e755449450a2badb533be.
Strike Bifrost_414a5427	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 414a5427b5d510b7f1eaf3c79c95e591.
Strike Bifrost_4294edbd	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4294edbd3d7041c08ca4af8dbec9b83f.
Strike Bifrost_442093d3	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 442093d33f762e6a42d1cf33087693e6.
Strike Bifrost_4511d282	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4511d282ddf3d91fca9e3882e1cba606.
Strike Bifrost_4b0ed0b3	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4b0ed0b302fb3388e431a3e6809d3556.
Strike Bifrost_4b22d70c	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4b22d70c0ebd8f3900e9ac41144833c2.
Strike Bifrost_4c39d9a1	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4c39d9a16e07a866fd6b34604cd32860.

<b>Name</b>	<b>Description</b>
Strike Bifrost_4f1975b3	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has random bytes appended at the end of the file. The MD5 hash of this Bifrost sample is 4f1975b3411e631aa3340b0b278c6aff.
Strike Bifrost_4f86b517	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4f86b517e0ff6130ae58d272476f5de8.
Strike Bifrost_4ff40064	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 4ff400648d164083a47963675b66d959.
Strike Bifrost_50c35460	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 50c35460a0eb4151aee2ad125710ee03.
Strike Bifrost_51d44d8f	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 51d44d8fcdd031a645e823d282e7d047.
Strike Bifrost_54170d06	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 54170d062684ad47af4fc1e9ee8213fe.
Strike Bifrost_546515e5	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 546515e5184e713641dd3cebee3c89b5.
Strike Bifrost_5797bcc3	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 5797bcc39cdc4731ceae5c87a9c673f1.

<b>Name</b>	<b>Description</b>
Strike Bifrost_597907c7	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The Parent binary was packed using upx, hence this binary is the unpacked version generated using upx -d. The MD5 hash of this Bifrost sample is 597907c703cddcff731ac25dc8a8becc.
Strike Bifrost_5a40d3ac	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 5a40d3ac2a6fe1eab16d1500ede4db8c.
Strike Bifrost_5dc995dd	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 5dc995dd9da3dcfa9bd7773e07a4284e.
Strike Bifrost_5f0e5fcf	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 5f0e5fcf4039b92c816086ba6d0a7e70.
Strike Bifrost_6255dd50	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 6255dd507eaa7098a14fb139562cb060.
Strike Bifrost_6815b438	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 6815b438ef2c105a05bd5a3137da5b6c.
Strike Bifrost_6a5543ec	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 6a5543ecb7d729b1ae8859c54b1f8cb6.
Strike Bifrost_70c04126	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 70c04126abb95a5378868c486b91c453.

<b>Name</b>	<b>Description</b>
Strike Bifrost_70fa85a1	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 70fa85a168782ac467530d7d3dbf5cda.
Strike Bifrost_72f8e14e	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 72f8e14ee194325d3390fa9d558b8349.
Strike Bifrost_75648244	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Bifrost sample is 756482447e93fb7e95df47c9054308ac.
Strike Bifrost_768d0741	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 768d0741724fd868b4fee7df162482ac.
Strike Bifrost_796e5e8b	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 796e5e8b154e8defa316ada29f9c6d4c.
Strike Bifrost_7ade2faa	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 7ade2faad28324ad407b1e430fc0d4fd.
Strike Bifrost_7b2cfdf1	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Bifrost sample is 7b2cfdf149b30ce6f15c3771f77c7430.
Strike Bifrost_7bfd93ce	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 7bfd93ce9a580270c34f0ee1d96720de.

<b>Name</b>	<b>Description</b>
Strike Bifrost_84932775	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 84932775991cc72e5e11f92dd8556fd6.
Strike Bifrost_84a4df6d	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 84a4df6dc8f2ba569351868e511a8118.
Strike Bifrost_8799cf57	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 8799cf572264225b73066d118e6de76f.
Strike Bifrost_88918aa9	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 88918aa93a7020accbf4cd82147f2d1d.
Strike Bifrost_8b220453	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 8b220453ce856f3709cd80beaae503b2.
Strike Bifrost_90005a6e	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 90005a6ee45152b570fd53742b878be7.
Strike Bifrost_970f9911	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 970f9911e2c475db87a15d1c4ebdaaef.
Strike Bifrost_9d901907	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is 9d901907a3c2735f7ffd4423b2b1f065.
Strike Bifrost_a40f1e19	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is a40f1e1925d182a079015e9b8b592fdb.

<b>Name</b>	<b>Description</b>
Strike Bifrost_a6ea548d	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is a6ea548d6c680bf5e3400369361400ed.
Strike Bifrost_a890f600	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is a890f60074d5a6f3ed85182b6f25f93a.
Strike Bifrost_abdcebab	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is abdccebabc0c8ce3ddc1f1d4f11902b.
Strike Bifrost_b3a67a87	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is b3a67a8740fa1bb3627aaefdd273d18d.
Strike Bifrost_b60f966a	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Bifrost sample is b60f966ae955ef8523dd28fdb5d252c0.
Strike Bifrost_b9d3c518	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is b9d3c5182f8dca8fb5006ca1f4e5f96e.
Strike Bifrost_ba292092	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is ba29209232395b99f8792f1f0451fe28.
Strike Bifrost_bb1b81ea	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is bb1b81eae69f9128d2ff6dcaf5e35c4b.

<b>Name</b>	<b>Description</b>
Strike Bifrost_bf2fd6b7	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is bf2fd6b7c36a87815ca49a0d7b1fb291.
Strike Bifrost_c6c33227	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is c6c332277d82fc026c2cad50ed41e0d2.
Strike Bifrost_c94fc1d1	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is c94fc1d14fdb11985ecb21e74a7bc59e.
Strike Bifrost_cbe88d2a	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Bifrost sample is cbe88d2aef9baba7301620c2d1949758.
Strike Bifrost_ccda89b2	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is ccda89b2dabe18acd3832754df245eee.
Strike Bifrost_ce1ac9f5	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is ce1ac9f5aba86897dec35ae27b33fd1c.
Strike Bifrost_ce832708	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is ce832708d4933212087f74c828bbaaa5.
Strike Bifrost_d4864301	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is d4864301b4ef997adb46e544ba64b158.

<b>Name</b>	<b>Description</b>
Strike Bifrost_d533aa9f	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has a new section added in the PE file format with random contents. The MD5 hash of this Bifrost sample is d533aa9f1d633528df82a69bb8c515ee.
Strike Bifrost_d5f53d7e	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is d5f53d7e5d74a981d2f15f3d953b5a90.
Strike Bifrost_d6fdcae2	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is d6fdcae22ca89a5a630f37638d2ec9f7.
Strike Bifrost_d7eabba1	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Bifrost sample is d7eabba14b4326449e5231ba9cc62194.
Strike Bifrost_d9f9f3d3	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is d9f9f3d3ebf767b3219bf16b8c3e1b80.
Strike Bifrost_df74478b	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Bifrost sample is df74478b8494a2a17157a8cd0cce6158.
Strike Bifrost_eaad1617	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is eaad1617f8f84e1072d6dc43ba791af3.
Strike Bifrost_ed5c7775	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is ed5c777571ca660b7d1eaaac12db6e17.

<b>Name</b>	<b>Description</b>
Strike Bifrost_ef19d9ec	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is ef19d9ec2a52269c50210d279066638a.
Strike Bifrost_f00b851e	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is f00b851edda9aa426fdf24b9c0679e1b.
Strike Bifrost_f3695bb5	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is f3695bb57ee730b63a99285b3e58af03.
Strike Bifrost_f844c72a	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is f844c72a7248602fbe0861525cacc8e1.
Strike Bifrost_f88047ff	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is f88047ff17da1e247c68d7e2a76732db.
Strike Bifrost_fa32787c	This strike sends a polymorphic malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The binary has the checksum removed in the PE file format. The MD5 hash of this Bifrost sample is fa32787cb971f620bed716b862ac6ed0.
Strike Bifrost_fa874b33	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is fa874b334f0797b3df342966fff5567f.
Strike Bifrost_fb998438	This strike sends a malware sample known as Bifrost. Bifrost is a backdoor that allows a remote attacker, who uses the client, to execute arbitrary code on the compromised machine. It contains standard Remote Access Trojan capabilities including taking screenshots, camera monitoring, and keylogging. The MD5 hash of this Bifrost sample is fb998438a3d3daf91488132b1c3cb2f6.
Strike Black Basta_32f17040	This strike sends a malware sample known as Black Basta. Black Basta is ransomware that was first seen in April 2022. The most recent variants have been seen targeting vm stores on ESXI machines. The MD5 hash of this Black Basta sample is 32f17040ddaf3477008d844c8eb98410.

<b>Name</b>	<b>Description</b>
Strike Black Basta_497ef477	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 497ef4779c6770e4497adf0bc71655f1.
Strike Black Basta_b648b730	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is b648b7305df49492c44a1280ec2228a0.
Strike BlackByte_eef97710	This strike sends a malware sample known as BlackByte. BlackByte is a ransomware group that employs a ransomware-as-a-service offering to malicious actors. Once infected communication with C2 servers is established. AnyDesk remote management software is installed as well as other publicly available software like 'netscanold' or 'psexec to perform lateral movement and establish persistence on the victim's machine. Once this functionality has been established the attacker demands a bitcoin ransom in order to decrypt the files on the system. The MD5 hash of this BlackByte sample is eef977108c7a7aef512532cc6e2f49cc.
Strike BlackCat_b6b9d449	This strike sends a malware sample known as BlackCat. BlackCat is ransomware written in rust. It has been tied to the BlackMatter ransomware group. The ransomware uses AES or CHACHA20 algorithms are for file encryption, and the executable is compiled specifically for the target organization. The MD5 hash of this BlackCat sample is b6b9d449c9416abf96d21b356a41a28e.
Strike BlackMatter_1019e015	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has the checksum removed in the PE file format. The MD5 hash of this BlackMatter sample is 1019e0151d6c55eeecf06443fa6197c7.
Strike BlackMatter_1060dca3	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 1060dca3875b4c027b247807b0a46ef9.
Strike BlackMatter_1dd464cb	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 1dd464cbb3fb6881eeef3f05b8b1fdb5.
Strike BlackMatter_3317daac	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 3317daace715dc332622d883091cf68b.

<b>Name</b>	<b>Description</b>
Strike BlackMatter_3f9a28e8	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 3f9a28e8c057e7ea7ccf15a4db81f362.
Strike BlackMatter_48f3e009	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this BlackMatter sample is 48f3e0096689e5b981a7494f9373c466.
Strike BlackMatter_4c146e1f	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has the debug flag removed in the PE file format. The MD5 hash of this BlackMatter sample is 4c146e1f99bbdc09ef5fcc8780b5b844.
Strike BlackMatter_50c49700	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 50c4970003a84cab1bf2634631fe39d7.
Strike BlackMatter_598c53bf	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 598c53bfef81e489375f09792e487f1a.
Strike BlackMatter_60f217dd	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 60f217dd352109f05550b9473d22dc6b.
Strike BlackMatter_61d0a6a7	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has been packed using upx packer, with the default options. The MD5 hash of this BlackMatter sample is 61d0a6a753435fd8e8993473c083b872.
Strike BlackMatter_687e5999	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this BlackMatter sample is 687e599972236164dbcdb1c229d27087.

<b>Name</b>	<b>Description</b>
Strike BlackMatter_6e9a1ea0	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 6e9a1ea049f79e227503fb5681a58d8e.
Strike BlackMatter_6fd84253	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this BlackMatter sample is 6fd842539aa3f5fd2e0474f3b48f877a.
Strike BlackMatter_720f6799	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has the checksum removed in the PE file format. The MD5 hash of this BlackMatter sample is 720f6799e6befa45cb4233b9631f4c82.
Strike BlackMatter_9200233d	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is 9200233d9b991b290c16d33a9956bea8.
Strike BlackMatter_98a3bee4	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has been packed using upx packer, with the default options. The MD5 hash of this BlackMatter sample is 98a3bee4399116289036d0224aac78d7.
Strike BlackMatter_9d047a42	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has random bytes appended at the end of the file. The MD5 hash of this BlackMatter sample is 9d047a4230a677be7daf5268a075d7e2.
Strike BlackMatter_9fa3caf8	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary file has one more imports added in the import table. The MD5 hash of this BlackMatter sample is 9fa3cafbc2f1ded8fe92007408e7625d.
Strike BlackMatter_a6237d50	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is a6237d5041d5a178c50bcad6387b405e.

<b>Name</b>	<b>Description</b>
Strike BlackMatter_ac50d0bc	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has the checksum removed in the PE file format. The MD5 hash of this BlackMatter sample is ac50d0bc460a702822ebae99a86761b5.
Strike BlackMatter_ad291818	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is ad2918181f609861ccb7bda8ebcb10e5.
Strike BlackMatter_b492d118	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has random bytes appended at the end of the file. The MD5 hash of this BlackMatter sample is b492d118edc1f091d3371012c2463e57.
Strike BlackMatter_b5c9d7c1	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this BlackMatter sample is b5c9d7c157a3fffd0cab340313f1c5ec.
Strike BlackMatter_b73ff289	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary file has one more imports added in the import table. The MD5 hash of this BlackMatter sample is b73ff289f910386f378a9b0a86b82fe9.
Strike BlackMatter_b786eef4	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is b786eef4adf086e8dbccc1c1f8d4d164.
Strike BlackMatter_ba375d06	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is ba375d0625001102fc1f2ccb6f582d91.
Strike BlackMatter_bff66be9	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this BlackMatter sample is bff66be9812f514e2ba8bd00746ef5cf.

Strike BlackMatter_c06b8cb2	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is c06b8cb2c5e3e282c7cc26836ce83f9b.
Strike BlackMatter_c5ef4711	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has been packed using upx packer, with the default options. The MD5 hash of this BlackMatter sample is c5ef4711b1b6303b622a8c73f4704430.
Strike BlackMatter_cd2d2003	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is cd2d2003cc0c59535a090f015ed629b7.
Strike BlackMatter_cfacfde5	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has the debug flag removed in the PE file format. The MD5 hash of this BlackMatter sample is cfacfde557d2762c0b7932b03c683b8a.
Strike BlackMatter_d0512f20	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is d0512f2063cbd79fb0f770817cc81ab3.
Strike BlackMatter_d19ab335	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is d19ab33523d0d070451213c05ed55eba.
Strike BlackMatter_da66726c	This strike sends a polymorphic malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this BlackMatter sample is da66726c18cecc87d776623fb1a26344.
Strike BlackMatter_e6b0276b	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is e6b0276bc3f541d8ff1ebb1b59c8bd29.

<b>Name</b>	<b>Description</b>
Strike BlackMatter_ec17046c	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is ec17046c66d51485a7d029acffa1599e.
Strike BlackMatter_f13669a4	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is f13669a48189b6b982ca2ec90c596d39.
Strike BlackMatter_f263c8c7	This strike sends a malware sample known as BlackMatter. BlackMatter is a Ransomware-as-a-Service or RaaS. It has followed in the footsteps of its predecessors DarkSide and REvil with a lot of the same functionality. It can elevate privileges, kill processes, and even steals the victim's details. The MD5 hash of this BlackMatter sample is f263c8c7872ff7f565fa1c6af55b97ca.
Strike BlackSnake_afa9d7c8	This strike sends a malware sample known as BlackSnake. BlackSnake is ransomware that has been created based on the source of the Chaos ransomware. BlackSnake has a clipper module that constantly monitors the user clipboard. This module shows it specifically targets Bitcoin wallet addresses to replace with the attacker wallet address. After this the ransomware performs file encryption as expected excluding hardcoded directories enumerated by the malware. The MD5 hash of this BlackSnake sample is afa9d7c88c28e9b8cca140413cfb32e4.
Strike BlackSuit_748de529	This strike sends a malware sample known as BlackSuit. This malware sample is known as BlackSuit. It drops a ransom note in each directory that contains encrypted files. This note contains a reference to its TOR chat site as well as a unique id per victim. The MD5 hash of this BlackSuit sample is 748de52961d2f182d47e88d736f6c835.
Strike BlackSuit_9656cd12	This strike sends a malware sample known as BlackSuit. This malware sample is known as BlackSuit. It drops a ransom note in each directory that contains encrypted files. This note contains a reference to its TOR chat site as well as a unique id per victim. The MD5 hash of this BlackSuit sample is 9656cd12e3a85b869ad90a0528ca026e.
Strike Black_Basta_0bf7bc20	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 0bf7bc20496143a9f028e77ab47b4698.
Strike Black_Basta_229ec577	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 229ec577744224d4d2fb2091ac253dd8.
Strike Black_Basta_267d5c31	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 267d5c3137d313ce1a86c2f255a835e6.

<b>Name</b>	<b>Description</b>
Strike Black_Basta_2a255e75	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 2a255e75f72ac142689082437a866c32.
Strike Black_Basta_2c383f6f	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 2c383f6fa25eea59fc54e5af19861fba.
Strike Black_Basta_2f90cd68	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 2f90cd68e4a92c5151c6e43902397a13.
Strike Black_Basta_3f400f30	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 3f400f30415941348af21d515a2fc6a3.
Strike Black_Basta_403dee0d	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 403dee0dd3891459b22a8a37828b66b8.
Strike Black_Basta_470c803b	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 470c803b32209fbef09af80a1b83e6f2.
Strike Black_Basta_4e8a7b03	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 4e8a7b03ff758f5c75ce992615a14fd0.
Strike Black_Basta_53fdb92	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 53fdb923b1890d29b8f29da77995938.
Strike Black_Basta_59db7bd2	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 59db7bd22d4ec503b768e6e646205c27.
Strike Black_Basta_6441d726	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 6441d7260944bc6dc5958c5c8a05d16d.

<b>Name</b>	<b>Description</b>
Strike Black_Basta_6f01787f	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 6f01787f5f644916b2dda5b4295efa4f.
Strike Black_Basta_80ab6a4d	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 80ab6a4d16c8137308dea1dc7922bd47.
Strike Black_Basta_8bae9edb	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 8bae9edb5b1035cd52ca45b23fee29d.
Strike Black_Basta_9f727c56	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is 9f727c56a415bf8ffa884ef241bbcd10.
Strike Black_Basta_a292fee8	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is a292fee8d8db83711e72c06d6f82562d.
Strike Black_Basta_b365faeb	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is b365faebaf416681b5f376c8aa4f4470.
Strike Black_Basta_bc95f228	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is bc95f228b11fa3b4e91c30d98f9fbff.
Strike Black_Basta_c115bbbd	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is c115bbbdb1a61f8c553d74802bfd78fb.
Strike Black_Basta_d1ae7511	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is d1ae751134e04bf6188aaed148409620.
Strike Black_Basta_d50a3b60	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is d50a3b60eb046c5d7bc6768bd3d7f1b9.

<b>Name</b>	<b>Description</b>
Strike Black_Basta_e52aa8e5	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is e52aa8e50c0ccf883b7ab7f0c36bb878.
Strike Black_Basta_e7d52019	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is e7d5201947829fd265a0356771fbebe63.
Strike Black_Basta_fd3631bf	This strike sends a polymorphic malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The binary has the debug flag removed in the PE file format. The MD5 hash of this Black Basta sample is fd3631bf37c87ad210bad170d67d33b9.
Strike Black_Basta_ff2f71df	This strike sends a malware sample known as Black Basta. Black Basta is a ransomware-as-a-service that was first identified in April 2022. It obtains initial access via spearphishing emails and vulnerabilities like CVE-2024-1709. The MD5 hash of this Black Basta sample is ff2f71dffeb997583fd297695de8c4ae.
Strike Blank Grabber_05ef1387	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 05ef1387852e2f3998fb16553d398e02.
Strike Blank Grabber_1dfcac12	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 1dfcac1261c5a8de83c9f5285efe6eac.
Strike Blank Grabber_26a8bb47	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 26a8bb47cefbd6bab1cb10c5108f4b67.

<b>Name</b>	<b>Description</b>
Strike Blank Grabber_28144f28	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 28144f2874cc381824c1cde06191bfb0.
Strike Blank Grabber_445021ec	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 445021eca48d79fc2bfb5e03baa0eb85.
Strike Blank Grabber_4984513d	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 4984513d03a78cf0654cf2efa9fd1203.
Strike Blank Grabber_683c060c	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 683c060cccc9ee3a5dad65946c8c9a88.
Strike Blank Grabber_6f0e94c8	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 6f0e94c80d8b9c98ea75bff456eff5a2.

<b>Name</b>	<b>Description</b>
Strike Blank Grabber_74e4afd2	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 74e4afd27d23e9d0b2f3ba6ba37da155.
Strike Blank Grabber_7c8c2e4b	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 7c8c2e4beb09b7ad7376d727ba307a60.
Strike Blank Grabber_84b87739	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 84b877394dca4f09b8320c3ac9a1d4cd.
Strike Blank Grabber_8a65bce5	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is 8a65bce5874cc2255b7ed4ae73acd8d5.
Strike Blank Grabber_a17eb2d1	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is a17eb2d181dd820bc6b65bea32554213.

Name	Description
Strike Blank Grabber_b5479bf5	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is b5479bf5c97cfa81c02676bb9335ab24.
Strike Blank Grabber_c90b1dc1	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is c90b1dc196b50dbab7584a18f47341a1.
Strike Blank Grabber_cbd90c5c	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is cbd90c5c8c6e0cbbc7963141798f367f.
Strike Blank Grabber_d99f4643	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is d99f4643fa07fa48ee5c7e700b0fd033.
Strike Blank Grabber_e106ba38	This strike sends a malware sample known as Blank Grabber. Blank Grabber is an information-stealing malware distributed through phishing packages uploaded to the Python Package Index (PyPI). The malware's primary functions include stealing Discord tokens, extracting browser passwords, targeting gaming platforms such as Minecraft and Roblox, and exfiltrating data via Discord webhooks. The malware also collects system details, Wi-Fi passwords, and IP information, all while maintaining a covert presence through file manipulation and deceptive alerts. The MD5 hash of this Blank Grabber sample is e106ba386d874f9a75bb8b3b4458c501.

<b>Name</b>	<b>Description</b>
Strike BlockBlaster_2b366e71	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is 2b366e711484cb6648e02bc9d7774f3f.
Strike BlockBlaster_7aa6b31c	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is 7aa6b31c1531f57d744dc7fde5e92338.
Strike BlockBlaster_a80a3dc3	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is a80a3dc310429fd2d98228e49157f35a.
Strike BlockBlaster_d35249a3	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is d35249a3f80fdbd17f2664e3408f78e9.
Strike BlockBlaster_dd8da7ba	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is dd8da7bae76527590f171eeda5a41987.

<b>Name</b>	<b>Description</b>
Strike BlockBlaster_f240341a	This strike sends a malware sample known as BlockBlaster. BlockBlaster is a malware that is delivered through the game "Abstractism" available on Steam. The malware is delivered via a game update which disguises it as an item drop system. Upon execution, the malware uses the victim's hardware to mine cryptocurrency, slowing down the system performance. Key capabilities of this malware include evasion techniques, cryptocurrency mining, and potentially stealing Steam credentials. The MD5 hash of this BlockBlaster sample is f240341a95f7df4c154520b841d1a5e3.
Strike BotenaGo_27a4dfa1	The malware BotenaGo is written in the open-source programming language Golang. It was originally discovered in 2021, but the source code was pushed to Github in 2022 and made available to the public. This BotenaGo variant as well as many others is expected to be used in future Exploit-Kits and malware targeting routers and IoT devices, as it contains roughly 33 exploits aimed at the vulnerabilities in these devices. To communicate it uses a reverse shell and a telnet loader to create a backdoor to receive commands from its command-and-control server. The MD5 hash of this BotenaGo sample is 27a4dfa1380e3866d89c79dd8f27f6ac.
Strike BotenaGo_29cb03ed	The malware BotenaGo is written in the open-source programming language Golang. It was originally discovered in 2021, but the source code was pushed to Github in 2022 and made available to the public. This BotenaGo variant as well as many others is expected to be used in future Exploit-Kits and malware targeting routers and IoT devices, as it contains roughly 33 exploits aimed at the vulnerabilities in these devices. To communicate it uses a reverse shell and a telnet loader to create a backdoor to receive commands from its command-and-control server. The MD5 hash of this BotenaGo sample is 29cb03edd8b97afe1d3d95c0fc6fa249.
Strike BotenaGo_aa594ae6	The malware BotenaGo is written in the open-source programming language Golang. It was originally discovered in 2021, but the source code was pushed to Github in 2022 and made available to the public. This BotenaGo variant as well as many others is expected to be used in future Exploit-Kits and malware targeting routers and IoT devices, as it contains roughly 33 exploits aimed at the vulnerabilities in these devices. To communicate it uses a reverse shell and a telnet loader to create a backdoor to receive commands from its command-and-control server. The MD5 hash of this BotenaGo sample is aa594ae685122794921ee62696102718.
Strike Brunhilda_b1b5eacc	This strike sends a malware sample known as Brunhilda. Brunhilda is an Android dropper-framework that hosts malicious applications on the Google Play Store. Recently it has been distributing the Android banking malware Vultur. Both malware families are created by the same threat actor group. The MD5 hash of this Brunhilda sample is b1b5eacc4d1cd7500e930286833f1626.
Strike Buer_093ddecf	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Buer sample is 093ddecf0e75f245cb2b3a8e431cbb06.

<b>Name</b>	<b>Description</b>
Strike Buer_1292fd2e	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has a new section added in the PE file format with random contents. The MD5 hash of this Buer sample is 1292fd2e94145944fc89568de433ea78.
Strike Buer_1ab2fc91	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Buer sample is 1ab2fc91ddfc486d3ec76c36a7ec5b43.
Strike Buer_1fa27c5e	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is 1fa27c5e084887e9e3a2e232d27e10e3.
Strike Buer_25f10854	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has random bytes appended at the end of the file. The MD5 hash of this Buer sample is 25f108547ce1d51064bfd9fd083c8da5.
Strike Buer_285e5729	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is 285e57297f578e565dc814301149edbf.
Strike Buer_2c5569c4	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has the debug flag removed in the PE file format. The MD5 hash of this Buer sample is 2c5569c4873195b82b2e3a602309c338.
Strike Buer_3cd5f44	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has random bytes appended at the end of the file. The MD5 hash of this Buer sample is 3cd5f4471a4f9dd34ac0b61d2f295dc.

<b>Name</b>	<b>Description</b>
Strike Buer_41f095e2	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has been packed using upx packer, with the default options. The MD5 hash of this Buer sample is 41f095e2a4b692820a8d70b27ed74590.
Strike Buer_693df2e2	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is 693df2e2029ed05eb3e7cccd214fb414f.
Strike Buer_733098ca	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has been packed using upx packer, with the default options. The MD5 hash of this Buer sample is 733098cad6d135345bc00f37cdca52c5.
Strike Buer_845c6f85	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Buer sample is 845c6f85f2a58dee6c49ed47ab052662.
Strike Buer_884fa51e	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Buer sample is 884fa51e7110c68b831899626e81345a.
Strike Buer_89d8c5bd	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is 89d8c5bdcc1dbb18e7ba59e4450fd001.
Strike Buer_8c5bd634	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has the checksum removed in the PE file format. The MD5 hash of this Buer sample is 8c5bd6343ee9630d246af49ca85951b0.

<b>Name</b>	<b>Description</b>
Strike Buer_9e8ca433	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Buer sample is 9e8ca4331d3d087f6ce750c2ba8ad455.
Strike Buer_a3987c9c	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is a3987c9c0ca7b09971a34fad7684cbc1.
Strike Buer_c397c806	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is c397c806d3c6196f368566319880df3c.
Strike Buer_cac3879e	This strike sends a malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The MD5 hash of this Buer sample is cac3879ed9dba1145f99376c2f32ebb7.
Strike Buer_d1b2c5f7	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Buer sample is d1b2c5f79f39a646bbd29f9aebbc57e9.
Strike Buer_ef9cb824	This strike sends a polymorphic malware sample known as Buer. Buer is a first stage downloader that is used to deploy other various forms of malware like ransomware to its intended victim. It is sold as a ready to go solution in underground marketplaces for parties looking for a malware that can provide modular options for delivery. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Buer sample is ef9cb8244219f4110d208229eff412d2.
Strike BugDrop_4b3c99ae	This strike sends a malware sample known as BugDrop. BugDrop is an Android malware that masquerades as a QR code scanner on the Google Play store. Its sole purpose is to bypass security measures used in the Google Play Store, and deploy a malicious payload, which is typically an Android Trojan. The MD5 hash of this BugDrop sample is 4b3c99ae792e7389c43102060633b4cc.
Strike BugDrop_ffd517d2	This strike sends a malware sample known as BugDrop. BugDrop is an Android malware that masquerades as a QR code scanner on the Google Play store. Its sole purpose is to bypass security measures used in the Google Play Store, and deploy a malicious payload, which is typically an Android Trojan. The MD5 hash of this BugDrop sample is ffd517d24a3d09082159493d859d4767.

<b>Name</b>	<b>Description</b>
Strike BugSleep_a50a20ed	This strike sends a malware sample known as BugSleep. BugSleep is a backdoor malware that has been associated with the Iranian threat group MuddyWater. It has the ability to execute commands, establish persistence, and transfer files between the target and the C2 server. The MD5 hash of this BugSleep sample is a50a20edddaded453410600549968914.
Strike BugSleep_a713e686	This strike sends a malware sample known as BugSleep. BugSleep is a backdoor malware that has been associated with the Iranian threat group MuddyWater. It has the ability to execute commands, establish persistence, and transfer files between the target and the C2 server. The MD5 hash of this BugSleep sample is a713e686fd984588a4db74f34bf32275.
Strike BugSleep_c17f4bb8	This strike sends a malware sample known as BugSleep. BugSleep is a backdoor malware that has been associated with the Iranian threat group MuddyWater. It has the ability to execute commands, establish persistence, and transfer files between the target and the C2 server. The MD5 hash of this BugSleep sample is c17f4bb8e415e21e6010b98e13c6dff3.
Strike BugSleep_d783001d	This strike sends a malware sample known as BugSleep. BugSleep is a backdoor malware that has been associated with the Iranian threat group MuddyWater. It has the ability to execute commands, establish persistence, and transfer files between the target and the C2 server. The MD5 hash of this BugSleep sample is d783001d1f98fe3b33e7b97b0b7d96dc.
Strike BugSleep_e7df84a5	This strike sends a malware sample known as BugSleep. BugSleep is a backdoor malware that has been associated with the Iranian threat group MuddyWater. It has the ability to execute commands, establish persistence, and transfer files between the target and the C2 server. The MD5 hash of this BugSleep sample is e7df84a5a22aeacf1c3abf4fd986c91.
Strike Bumblebee_171e9b04	This strike sends a polymorphic malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The binary has the debug flag removed in the PE file format. The MD5 hash of this Bumblebee sample is 171e9b04a8b64c8b131c2d97bdc77879.
Strike Bumblebee_1fa7585f	This strike sends a malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The MD5 hash of this Bumblebee sample is 1fa7585fa75b40c7aa52245d0cd13bc0.
Strike Bumblebee_21c886ea	This strike sends a polymorphic malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Bumblebee sample is 21c886eae8ce6dcef907160e430bba92.

<b>Name</b>	<b>Description</b>
Strike Bumblebee_23c611cb	This strike sends a polymorphic malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The binary has random bytes appended at the end of the file. The MD5 hash of this Bumblebee sample is 23c611cb0d5f3d9d18f24eb1155d14da.
Strike Bumblebee_25a8caa9	This strike sends a polymorphic malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Bumblebee sample is 25a8caa929eb681e1f75b495e8ddbdde.
Strike Bumblebee_40a31230	This strike sends a malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The MD5 hash of this Bumblebee sample is 40a312301d8462ef105bfc5ab26ba24d.
Strike Bumblebee_b3795bfd	This strike sends a malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The MD5 hash of this Bumblebee sample is b3795bfd719bba20a0a258c8b49c4303.
Strike Bumblebee_d11663fa	This strike sends a polymorphic malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Bumblebee sample is d11663fa06c252e4601c21fc7233603c.
Strike Bumblebee_e6a046d1	This strike sends a malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The MD5 hash of this Bumblebee sample is e6a046d1baa7cd2100bdf48102b8a144.
Strike Bumblebee_f225b34f	This strike sends a polymorphic malware sample known as Bumblebee. Bumblebee is a downloader that contains anti-virtualization checks and the ability to download and execute other malicious payloads. Bumblebee has been associated with multiple campaigns, and has been known to deliver shellcode, Meterpreter, Silver and Cobalt Strike. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Bumblebee sample is f225b34ffcf75bcd79a6dfc6a55c4d94.

<b>Name</b>	<b>Description</b>
Strike Bunitu_09126060	This strike sends a malware sample known as Bunitu. Once Bunitu establishes persistence on the system it turns that machine into a proxy for malicious VPN services. The MD5 hash of this Bunitu sample is 09126060aac595665a43eb4bdf868d8e.
Strike Bunitu_0b1fbf7b	This strike sends a malware sample known as Bunitu. Once Bunitu establishes persistence on the system it turns that machine into a proxy for malicious VPN services. The MD5 hash of this Bunitu sample is 0b1fbf7b3d1ec2a4ba50ee98e652f034.

Strike CaddyWiper_b8da675f	This strike sends a polymorphic malware sample known as CaddyWiper. CaddyWiper is a Ukraine targeted, relatively small in size wiper malware with the purpose of destroying all the contents of a system's drives. Before erasing these files it checks that the machine is not a domain controller, and if it is it will halt execution. If it is not a dc it will continue by wiping files on each drive on the system. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this CaddyWiper sample is b8da675f41ea93ea27c76db661bc095d.
Strike CaddyWiper_da4ae5cf	This strike sends a polymorphic malware sample known as CaddyWiper. CaddyWiper is a Ukraine targeted, relatively small in size wiper malware with the purpose of destroying all the contents of a system's drives. Before erasing these files it checks that the machine is not a domain controller, and if it is it will halt execution. If it is not a dc it will continue by wiping files on each drive on the system. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this CaddyWiper sample is da4ae5cf38e4cef1113a7acc04830d2d.
Strike CastleRAT_14610b22	This strike sends a malware sample known as CastleRAT. CastleRAT is a malware of the Remote Access Trojan (RAT) family that targets primarily Ukrainian entities. It is delivered through a loader, CastleLoader, which is distributed via malicious Microsoft Word documents. Upon execution, it establishes persistence on the victim's machine, collects system information, and communicates with a command-and-control server. Its key capabilities include executing arbitrary commands, uploading and downloading files, and keylogging, all controlled remotely by the attacker. The MD5 hash of this CastleRAT sample is 14610b22a749a0cd464d1985abbff45f.
Strike CastleRAT_22b5bf29	This strike sends a malware sample known as CastleRAT. CastleRAT is a malware of the Remote Access Trojan (RAT) family that targets primarily Ukrainian entities. It is delivered through a loader, CastleLoader, which is distributed via malicious Microsoft Word documents. Upon execution, it establishes persistence on the victim's machine, collects system information, and communicates with a command-and-control server. Its key capabilities include executing arbitrary commands, uploading and downloading files, and keylogging, all controlled remotely by the attacker. The MD5 hash of this CastleRAT sample is 22b5bf2931140fae49228ced1d1dd3d7.
Strike CastleRAT_35f81d06	This strike sends a malware sample known as CastleRAT. CastleRAT is a malware of the Remote Access Trojan (RAT) family that targets primarily Ukrainian entities. Strike Cerber_f99d1b2f	This strike sends a polymorphic malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber." The binary has random strings (lorem ipsum) appended at the end of the file." The MD5 hash of this Cerber sample is f99d1b2fae036d1dc72c13c075961d14.
Strike Cerber_fb4af472	This strike sends a polymorphic malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber". The binary has random bytes appended at the end of the file. The MD5 hash of this Cerber sample is fb4af472afa96bd412d67b9080699494.
Strike Cerber_fbd66faf	This strike sends a malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber." The MD5 hash of this Cerber sample is fbd66faff99a1b8f056a6075b512621e.
Strike Cerber_fce00a14	This strike sends a malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber." The MD5 hash of this Cerber sample is fce00a14d4542ddada0bebfoa40cb7ea.
Strike Cerber_fe03f656	This strike sends a malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber." The MD5 hash of this Cerber sample is fe03f656cc2a508f3bedaa131fe9509c.
Strike Cerber_fe2ccd90	This strike sends a polymorphic malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber." The binary has random contents appended in one of the existing sections in the PE file format." The MD5 hash of this Cerber sample is fe2ccd90af759a48ec678af945fb84c5.
Strike Cerber_fffb908e	This strike sends a polymorphic malware sample known as Cerber. Cerber is ransomware that encrypts documents, photos, databases and other important files using the file extension ".cerber." The binary has random strings (lorem ipsum) appended at the end of the file." The MD5 hash of this Cerber sample is fffb908eff59f3dc30b3f6a785102bcc.

<b>Name</b>	<b>Description</b>
Strike ChaosRAT_30598ea4	<p>This strike sends a malware sample known as Chaos RAT. This strike sends a malware sample known as Chaos RAT. Chaos RAT is a cross-platform remote access trojan written in Golang that targets both Windows and Linux systems. It is delivered through phishing campaigns and disguises itself as legitimate tools such as network analyzers. Once executed, the malware establishes communication with a command and control server using encoded configuration files and JWT tokens. It allows attackers to run system commands, capture screenshots, exfiltrate files, and deploy cryptocurrency miners. Chaos RAT also uses obfuscation techniques and sets up persistence through scheduled tasks on Windows or cron jobs on Linux. The MD5 hash of this Chaos RAT sample is 30598ea49a58838e3bea367e89653202.</p>

Strike ChatGPT-SmsMalware_8468af0e	This strike sends an Android malware sample which sample poses as a ChatGPT app. It's a SMS malware which performs billing fraud by sending SMS messages to premium numbers in an attempt to empty wallet of victims. 'com.chatgpt.ogothai' is the package name of the malware sample. The MD5 hash of this sample is 4e8d09ca0543a48f649fce72483777f0.
Strike ChatGPT-SmsMalware_da4df33c	This strike sends an Android polymorphic malware sample which sample poses as a ChatGPT app. It's a SMS malware which performs billing fraud by sending SMS messages to premium numbers in an attempt to empty wallet of victims. 'com.chatgpt.ogothai' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this sample is da4df33c3c6ea0e313d913a9a6df5856.
Strike ChatGPT-SmsMalware_ededa287	This strike sends an Android polymorphic malware sample which sample poses as a ChatGPT app. It's a SMS malware which performs billing fraud by sending SMS messages to premium numbers in an attempt to empty wallet of victims. 'com.chatgpt.ogothai' is the package name of the malware sample. The malware has been randomly rebuilt without any modifications. The MD5 hash of this sample is ededa2877f700a2dc8e1119ac59c85ea.
Strike Chthonic_07db0094	This strike sends a malware sample known as Chthonic. Chthonic is a banking trojan that is normally delivered by the attacker via phishing emails. Its purpose to to exfiltrate sensitive credentials from the victim machine, and has also been seen delivering other malware like AZORult to perform additional functionality. The MD5 hash of this Chthonic sample is 07db009460cbefb77763f3dcf7559b89.

<b>Name</b>	<b>Description</b>
Strike Chthonic_35e71926	This strike sends a polymorphic malware sample known as Chthonic. Chthonic is a banking trojan that is normally delivered by the attacker via phishing emails. Its purpose to to exfiltrate sensitive credentials from the victim machine, and has also been seen delivering other malware like AZORult to perform additional functionality. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Chthonic sample is 35e7192617a5bfe4e3663f40610a7f11.
Strike Chthonic_39a1430c	This strike sends a polymorphic malware sample known as Chthonic. Chthonic is a banking trojan that is normally delivered by the attacker via phishing emails. Its purpose to to exfiltrate sensitive credentials from the victim machine, and has also been seen delivering other malware like AZORult to perform additional functionality. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Chthonic sample is 39a1430c7d0bf12a9b42dad4e6b49ac6.
Strike Chthonic_39e3d389	This strike sends a malware sample known as Chthonic. Chthonic is a banking trojan that is normally delivered by the attacker via phishing emails. Its purpose to to exfiltrate sensitive credentials from the victim machine, and has also been seen delivering other malware like AZORult to perform additional functionality. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The binary file has one more imports added in the import table. The MD5 hash of this Clop sample is 3c8041db612aaae02f6a7817722d3860.
Strike Clop_5700ff4d	This strike sends a polymorphic malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The binary has random bytes appended at the end of the file. The MD5 hash of this Clop sample is 5700ff4de05433adf34b7d953921309c.
Strike Clop_77e19f05	This strike sends a polymorphic malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The binary has the debug flag removed in the PE file format. The MD5 hash of this Clop sample is 77e19f056443b6dbbcccc1336251a7e4.
Strike Clop_9609f431	This strike sends a malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The MD5 hash of this Clop sample is 9609f431724b58e4830caa8edbe80762.
Strike Clop_a8cc764e	This strike sends a malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The MD5 hash of this Clop sample is a8cc764e7c7a62a0fc26bbe3df31daa6.
Strike Clop_abdf4986	This strike sends a malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The MD5 hash of this Clop sample is abdf498691f2b028bae0fa4276edc04b.

<b>Name</b>	<b>Description</b>
Strike Clop_cff8284f	This strike sends a polymorphic malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The binary has been packed using upx packer, with the default options. The MD5 hash of this Clop sample is cff8284fc354db8d10f0b98c207a990a.
Strike Clop_df84820d	This strike sends a polymorphic malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Clop sample is df84820d39d82e9b44b189046271e03d.
Strike Clop_eb846aab	This strike sends a polymorphic malware sample known as Clop. Clop ransomware was originally detected as a variant of the CryptoMix ransomware family. It currently targets entire networks instead of individual machines and even attempts to disable Windows Defender and other security tools. Before it begins encryption of the system, it disables target processes, which can include debuggers, text editors, IDEs, as well as a host of Windows processes like Windows 10 and Microsoft applications. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Clop sample is eb846aab3d964db15250f61d12d20dc0.
Strike CloudScout_166b0d75	This strike sends a malware sample known as CloudScout. CloudScout is a toolset that has been used by the Chinese aligned APT group Evasive Panda. This group's objective is cyber espionage against countries and organizations that would not be aligned with Chinese interests. CloudScout is a .NET framework that consists of several modules that target different services like Google Drive, Gmail, and Outlook. The malware attempts to steal data from these services through session cookies by hijacking authenticated sessions from web browsers. The MD5 hash of this CloudScout sample is 166b0d75858ec81744921b133d72ab2d.
Strike CloudScout_624d58a9	This strike sends a malware sample known as CloudScout. CloudScout is a toolset that has been used by the Chinese aligned APT group Evasive Panda. This group's objective is cyber espionage against countries and organizations that would not be aligned with Chinese interests. CloudScout is a .NET framework that consists of several modules that target different services like Google Drive, Gmail, and Outlook. The malware attempts to steal data from these services through session cookies by hijacking authenticated sessions from web browsers. The MD5 hash of this CloudScout sample is 624d58a9a56c0f0a5c4923557a99f808.

<b>Name</b>	<b>Description</b>

<b>Name</b>	<b>Description</b>
Strike CobaltStrike_0db5767d	<p>This strike sends a malware sample known as Cobalt Strike. This strike sends a malware sample known as a Cobalt Strike PowerShell loader. This malware is a PowerShell-based loader that decrypts and executes shellcode directly in memory to deliver a Cobalt Strike Beacon. It is distributed through a publicly accessible .ps1 script hosted on infrastructure associated with Chinese and Russian regions. The loader employs evasion techniques such as API hashing, dynamic function resolution, and forged User-Agent headers. It retrieves its second-stage payload from a Baidu Cloud Function endpoint and communicates with a Russian-hosted command and control server using a Cobalt Strike SSL certificate. The MD5 hash of this Cobalt Strike sample is 0db5767dba54e0e68ff26c585ce2e590.</p>
Strike CobaltStrike_58d5fc70	<p>This strike sends a malware sample known as Cobalt Strike. This strike sends a malware sample known as a Cobalt Strike PowerShell loader. This malware is a PowerShell-based loader that decrypts and executes shellcode directly in memory to deliver a Cobalt Strike Beacon. It is distributed through a publicly accessible .ps1 script hosted on infrastructure associated with Chinese and Russian regions. The loader employs evasion techniques such as API hashing, dynamic function resolution, and forged User-Agent headers. It retrieves its second-stage payload from a Baidu Cloud Function endpoint and communicates with a Russian-hosted command and control server using a Cobalt Strike SSL certificate. Strike CobaltStrike_da15e8aa	This strike sends a malware sample known as Cobalt Strike. This strike sends a malware sample known as a Cobalt Strike PowerShell loader. This malware is a PowerShell-based loader that decrypts and executes shellcode directly in memory to deliver a Cobalt Strike Beacon. It is distributed through a publicly accessible .ps1 script hosted on infrastructure associated with Chinese and Russian regions. The loader employs evasion techniques such as API hashing, dynamic function resolution, and forged User-Agent headers. It retrieves its second-stage payload from a Baidu Cloud Function endpoint and communicates with a Russian-hosted command and control server using a Cobalt Strike SSL certificate. The MD5 hash of this Cobalt Strike sample is da15e8aa592ad3fd7a43bba187a4a706.
Strike Conti_290c7dfb	This strike sends a malware sample known as Conti. Conti is a Ransomware-as-a-Service, that in the past has been associated with TrickBot, and is being called the successor to Ryuk. Most recently it has been seen attacking large organizations and government agencies. Conti not only encrypts the victim's files, but also steals their data and threatens to publish the stolen data. It uses known vulnerabilities like in Microsoft SMB and MS Print Spooler CVE-2021-34527 to escalate privileges and move laterally throughout the network. Conti deploys Cobalt Strike beacons to perform C2 functionality, but also installs remote management software like AnyDesk and Atera to maintain persistence. The MD5 hash of this Conti sample is 290c7dfb01e50cea9e19da81a781af2c.
Strike Conti_50e767c6	This strike sends a malware sample known as Conti. Conti is a Ransomware-as-a-Service, that in the past has been associated with TrickBot, and is being called the successor to Ryuk. Most recently it has been seen attacking large organizations and government agencies. Conti not only encrypts the victim's files, but also steals their data and threatens to publish the stolen data. It uses known vulnerabilities like in Microsoft SMB and MS Print Spooler CVE-2021-34527 to escalate privileges and move laterally throughout the network. Conti deploys Cobalt Strike beacons to perform C2 functionality, but also installs remote management software like AnyDesk and Atera to maintain persistence. The MD5 hash of this Conti sample is 50e767c614b48b05c6d6574edfcacb2a.

<b>Name</b>	<b>Description</b>
Strike Copybara_03ee48f6	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 03ee48f6e7f0840ef94336af579ccdf4.
Strike Copybara_0596663c	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 0596663c542e7cfb4473c8c8ef86eee5.
Strike Copybara_112bc421	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 112bc421690788f883e62742cd7e142a.
Strike Copybara_1150d0bf	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 1150d0bf3a077be4f33eb487129d389a.
Strike Copybara_14e70653	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 14e70653b82895367d33ec8570c9038e.
Strike Copybara_18ac895a	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 18ac895a5f348d2a05d6a07a213d84a6.
Strike Copybara_1ec0f869	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 1ec0f8696578e0e427140fd256ec4e4f.
Strike Copybara_215ca929	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 215ca929eea5866ef9e879fe37f9ce17.
Strike Copybara_215eb7fd	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 215eb7fd4c261e17a696e8ba6a4061ed.

<b>Name</b>	<b>Description</b>
Strike Copybara_22483da7	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 22483da70e998a316e9ac5b905b0fc9e.
Strike Copybara_271f79eb	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 271f79eb4ca49040fef16725777ac577.
Strike Copybara_28f2aaa7	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 28f2aaa7855c1a2d5e5ec6444fa833a9.
Strike Copybara_2c36088f	This strike sends a malware sample known as Copybara. It is an Android malware spread through vishing attacks and masquerades as legitimate financial apps. It exploits the Accessibility Service to control infected devices, downloading phishing pages that impersonate cryptocurrency exchanges and financial institutions. The malware steals credentials and performs keylogging, SMS interception, screen capturing, and remote device control. It leverages the MQTT protocol for efficient communication with its C2 server. 'com.sastiupana.newicon' is the package name of the malware sample. The MD5 hash of this malware sample is 2c36088fec061815bdcebb93aec8771d.
Strike Copybara_2d04f0f8	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 2d04f0f898b452f05521a71ee2457eab.
Strike Copybara_304f779e	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 304f779e21b4f70f4ce70ce4dd19dbe8.
Strike Copybara_3251cb47	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 3251cb4712b6c7aeb3f48c3ef767c735.
Strike Copybara_3c90ca08	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server The MD5 hash of this Copybara sample is 3c90ca08d834d4650409a4282bbe6d42.

Strike Copybara_3eaafdc6	This strike sends a polymorphic malware sample known as Copybara. It is an Android malware spread through vishing attacks and masquerades as legitimate financial apps. It exploits the Accessibility Service to control infected devices, downloading phishing pages that impersonate cryptocurrency exchanges and financial institutions. The malware steals credentials and performs keylogging, SMS interception, screen capturing, and remote device control. It leverages the MQTT protocol for efficient communication with its C2 server. 'com.sastiupana.newicon' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this Copybara sample is 3eaafdc602ab53fa199bc797970f0cb7.
Strike Copybara_459b8182	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server. The MD5 hash of this Copybara sample is 459b8182aaaf3ef14e9fd4754b40610a.
Strike Copybara_45b6c878	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server. The MD5 hash of this Copybara sample is 45b6c878e32dafc7fd16f9c088637be2.
Strike Copybara_4637f70b	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server. The MD5 hash of this Copybara sample is 4637f70bb727b40f3d7e8be88da1f244.
Strike Copybara_47cf4564	This strike sends a polymorphic malware sample known as Copybara. It is an Android malware spread through vishing attacks and masquerades as legitimate financial apps. It exploits the Accessibility Service to control infected devices, downloading phishing pages that impersonate cryptocurrency exchanges and financial institutions. The malware steals credentials and performs keylogging, SMS interception, screen capturing, and remote device control. It leverages the MQTT protocol for efficient communication with its C2 server. 'com.intesatoken.appnuova' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this Copybara sample is 47cf4564ddf329f97ba929c302f36682.
Strike Copybara_4e519739	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server. The MD5 hash of this Copybara sample is 4e51973921f1bf1c26b7d045d9716ae8.
Strike Copybara_4f007c67	This strike sends a malware sample known as Copybara. Copybara is an Android trojan. It includes many capabilities like keylogging, multimedia recording, screen capturing, and remote device control. Copybara uses MQTT to communicate with the attacker C2 server. The MD5 hash of this Copybara sample is 4f007c674721466ff8af2d6b8b0e6040.

This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 2f6afa2fcc7047a5cc92f193945c9ae2.
Strike CoralRaider_309c2e58	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 309c2e58a60117b1943731995a49c06c.
Strike CoralRaider_3e48f80c	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 3e48f80c959a5c47854e260cb975a6dd.
Strike CoralRaider_57965340	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 57965340966b56befcc24e6c11b5afdf.
Strike CoralRaider_6927beab	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 6927beab231d254cdc66fc8004c76fd.
Strike CoralRaider_7c1d3d83	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 7c1d3d83db6393781e5d35972273720d.
Strike CoralRaider_83fac34f	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 83fac34f21d0a9addefc653c68d63463.

Name	Description
Strike CoralRaider_8527635e	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 8527635ef61d35dc68350c97374cf4f2.
Strike CoralRaider_862c45dc	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is 862c45dca475a210fa65c26a0e38c88c.
Strike CoralRaider_ab1d3e72	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is ab1d3e723949526483c90ca2e0f0f1f6.
Strike CoralRaider_bfa936de	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is bfa936de26037dd4693af0f8d69cddc8.
Strike CoralRaider_ca5e9fed	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is ca5e9fed7743c871358c9f29bb477947.
Strike CoralRaider_ce5fb5a	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is ce5fb5af0805ae714563ea936298358.
Strike CoralRaider_d25195da	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is d25195dac69807fe69ce9e00bfeee71a.

The MD5 hash of this CoralRaider sample is f1bcaab51a0b18e531cdac76909f4541.
Strike CoralRaider_f75e029c	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is f75e029c90ba91bd8c456ce08a8b5ed5.
Strike CoralRaider_fa23d314	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is fa23d314aad9190927e56831e506c3ee.
Strike CoralRaider_ff93e477	This strike sends a malware sample known as CoralRaider. This malware sample is associated with the CoralRaider threat actor and has been seen in a campaign in which a Windows shortcut file to execute an HTA file on a remotely hosted machine. This HTA file executes an embedded Windows Powershell decrypter that eventually downloads and executes one of the following malicious payloads CryptBot, LummaC2 or Rhadamanthys. The MD5 hash of this CoralRaider sample is ff93e4776d6131a014e96421a7df26ab.
Strike CriminalMW_2cfcdc58	This strike sends a polymorphic malware sample known as CriminalMW. CriminalMW, also known as GoatRAT and FantasyMW, is an Android banking trojan malware classified as a Remote Access Trojan (RAT). The malware primarily targets Brazilian banks, aiming to steal financial information. It can steal various sensitive pieces of information from the infected device, including messages, call logs, and photographs. Attackers can remotely control the device, allowing them to perform actions such as taking screenshots, recording audio and video, and executing commands. CriminalMW employs anti-emulation techniques to evade detection by security software. 'biz.uea.xgn' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 2cfcdc58e77faa2717f13bd91153509c.

This malware is ransomware that scans and encrypts files and demands payment via Bitcoin. The MD5 hash of this CyberVolk sample is 535bc51f49d1106cf06dfe92ad0444b5.
Strike CyberVolk_57e7e215	This strike sends a malware sample known as CyberVolk. CyberVolk is a Russian aligned group that utilizes malware against targets that have opposing interests to Russia. This malware is ransomware that scans and encrypts files and demands payment via Bitcoin. The MD5 hash of this CyberVolk sample is 57e7e2151ac4443d3a30d61d4426428a.
Strike CyberVolk_626fab82	This strike sends a malware sample known as CyberVolk. CyberVolk is a Russian aligned group that utilizes malware against targets that have opposing interests to Russia. This malware is ransomware that scans and encrypts files and demands payment via Bitcoin. The MD5 hash of this CyberVolk sample is 626fab8275d8d8e841bc9a08b208201e.

<b>Name</b>	<b>Description</b>
Strike CyberVolk_648bd793	This strike sends a malware sample known as CyberVolk. CyberVolk is a Russian aligned group that utilizes malware against targets that have opposing interests to Russia. This malware is ransomware that scans and encrypts files and demands payment via Bitcoin. The MD5 hash of this CyberVolk sample is 648bd793d9e54fc2741e0ba10980c7de.
Strike CyberVolk_889e6365	This strike sends a malware sample known as CyberVolk. CyberVolk is a Russian aligned group that utilizes malware against targets that have opposing interests to Russia. This malware is ransomware that scans and encrypts files and demands payment via Bitcoin. The MD5 hash of this CyberVolk sample is 889e6365d82a9a89b6c8c86d672b8f0c.
Strike DOGcall_394e52e2	This strike sends a malware sample known as DOGcall. DOGcall aslo known as ROKRat is a family of malware that was initially seen from attackers originating from North Korea. The malware has a loader that drops the core payload. This sample is the final payload, and it is a Remote Access Trojan that provides the attacker with a number of functions including data exfiltration, credential harvesting, screenshots of the system, and communicating with a remote C2 server for additional received commands. The MD5 hash of this DOGcall sample is 394e52e219feb1a5c403714154048728.
Strike DOGcall_dc6c2033	This strike sends a polymorphic malware sample known as DOGcall. DOGcall aslo known as ROKRat is a family of malware that was initially seen from attackers originating from North Korea. The malware has a loader that drops the core payload. This sample is the final payload, and it is a Remote Access Trojan that provides the attacker with a number of functions including data exfiltration, credential harvesting, screenshots of the system, and communicating with a remote C2 server for additional received commands. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this DOGcall sample is dc6c20333f94a04c6cdea4fe9211ac09.
Strike DUSTPAN_17d0ada8	This strike sends a malware sample known as DUSTPAN. DUSTPAN is a in-memory dropper that decrypts and executes an embedded payload. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTPAN sample is 17d0ada8f5610ff29f2e8eaf0e3bb578.
Strike DUSTTRAP_336a0d6f	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is 336a0d6f8cc92bf9740ce17de600463b.

<b>Name</b>	<b>Description</b>
Strike DUSTTRAP_393065ef	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. Strike DUSTTRAP_c33247bc	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is c33247bc3e7e8cb72133e47930e6ddad.

<b>Name</b>	<b>Description</b>
Strike DUSTTRAP_cfce8554	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is cfce85548436fb89a83bf34dc17f325d.
Strike DUSTTRAP_d72f202c	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is d72f202c1d684c9a19f075290a60920f.
Strike DUSTTRAP_dc725f5e	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is dc725f5e9b1ae062fbec86ee4d816b45.
Strike DUSTTRAP_e4a4aafb	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is e4a4aafb49b8c86a5ac087ae342c0ee6.
Strike DUSTTRAP_e584119a	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is e584119a4766e6cf49093c666965c8be.

Name	Description
Strike DUSTTRAP_e98b9e21	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is e98b9e21928252332edf934f3d18ac21.
Strike DUSTTRAP_f1769ad5	This strike sends a malware sample known as DUSTTRAP. DUSTPAN is a multi-stage multi plugin framework with many components. First it begins by decrypting an encrypted PE file and executes this in memory. Second this decrypted PE decrypts an embedded config as well as embedded plugin dlls. Next the first plugin is observed setting up low level network communication and encryption. Finally the second plugin performs higher level network operations like downloading additional plugins to perform additional functionality. It has been associated with the Chinese state-sponsored cyber threat group APT41, and has been tied to many different sectors like healthcare, telecommunications, and logistics. The MD5 hash of this DUSTTRAP sample is f1769ad5a9dc44794895275c656ed484.
Strike DarkBit_9880fae6	This strike sends a malware sample known as DarkBit. The DarkBit malware is a ransomware that was recently detected in an attack targeting one of Israel's top research universities. The ransomware can accept command-line arguments or run autonomously, and it encrypts the victim's system by default with AES-256. The MD5 hash of this DarkBit sample is 9880fae6551d1e9ee921f39751a6f3c0.
Strike DarkComet_0024d4df	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 0024d4df650a7d03dae83d24097cf10.
Strike DarkComet_015d482e	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this DarkComet sample is 015d482efe46a5aa054da29a11fd9d21.
Strike DarkComet_01a2e344	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 01a2e3440d5c65442c49fe708bf94003.

<b>Name</b>	<b>Description</b>
Strike DarkComet_06844957	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 06844957c6215d0ff53804e7e5a46567.
Strike DarkComet_084b0f16	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has the timestamp field updated in the PE file header. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 084b0f165368df6f048a0aac03c55240.
Strike DarkComet_096522f8	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 096522f8c09e14d2e70723bd8d0ecd21.
Strike DarkComet_0a420405	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 0a4204058a34296805b9823fac136750.
Strike DarkComet_0ea9e3da	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has been packed using upx packer, with the default options. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 0ea9e3daf54f3bce7e88362025bfc2c1.
Strike DarkComet_117dba14	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 117dba14282c9be237e14438af11f35c.

<b>Name</b>	<b>Description</b>
Strike DarkComet_1219a18c	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 1219a18c7f3e406d8599bab3b962e2e.
Strike DarkComet_123164e8	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 123164e86411d412d6d7815f5da7a3f7.
Strike DarkComet_12ceeaa8a	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 12ceeaa8ab41fbbee00fe350ea1948eee.
Strike DarkComet_14c54f08	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 14c54f08e7b9421fc79e475494287e88.
Strike DarkComet_156fcf96	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 156fcf96d11dc0072bad9750a07a4586.
Strike DarkComet_17874dac	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has random strings (lorem ipsum) appended at the end of the file. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 17874dac85b06738e1a3bedf24c327fa.
Strike DarkComet_180f8ee1	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 180f8ee1842a3465cf9bb2e1fedce8e.

<b>Name</b>	<b>Description</b>
Strike DarkComet_19d34e15	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 19d34e15ccece451ec5c6cc8ca446a2c.
Strike DarkComet_1a7f4440	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has been packed using upx packer with the default options. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 1a7f44409dc48a420368033cc6e3c532.
Strike DarkComet_1cb232ad	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 1cb232ad0fd978eaa20c6d569d72cc64.
Strike DarkComet_1ccf967b	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 1ccf967b97a04e428c427aa7e2443e4e.
Strike DarkComet_1d84bf5f	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 1d84bf5fdfd13591e97963da8e127463.
Strike DarkComet_215b14ac	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 215b14ac07078cf72774efca6bbbfc6.
Strike DarkComet_21c6f354	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 21c6f354ae5716237ce20d781a9fe1b6.

DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has random strings (lorem ipsum) appended at the end of the file. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 525c90b09a41da79d49ba246b6c2e5c1.
Strike DarkComet_5288ee62	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 5288ee620e47eff39ba4db70e62e249b.

<b>Name</b>	<b>Description</b>
Strike DarkComet_52a36eb8	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 52a36eb898a816a12e52f81c2160adb3.
Strike DarkComet_52dc384a	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system.The binary has random bytes appended at the end of the file. The MD5 hash of this DarkComet sample is 52dc384a398e644786a67e03ce9011c7.
Strike DarkComet_55f9fbdf	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system.The binary has random strings (lorem ipsum) appended at the end of the file. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 55f9fbdfbec0c1160c66e97c6e9b93e8.
Strike DarkComet_5bd6a495	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system.The binary has random bytes appended at the end of the file. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 5bd6a4959e85dc87e9fcd0da98bd36ab.
Strike DarkComet_5de32a2e	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is 5de32a2ef97290585b28f4409384251a.
Strike DarkComet_5fdfd1ed	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system.The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this DarkComet sample is 5fdfd1edd86e6752cc76e9de5d5d17e1.

<b>Name</b>	<b>Description</b>
Strike DarkComet_5ff45a27	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this DarkComet sample is 5ff45a27e2c9d3708240303a78e0be6e.
Strike DarkComet_6246b3fa	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 6246b3fab642506182bd3cfe2b08f071.
Strike DarkComet_638854bf	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 638854bf5d54769e559abdd901b40579.
Strike DarkComet_646128de	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has a random section name renamed according to the PE format specification. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 646128de2317254aec6537a834acc16e.
Strike DarkComet_653637f3	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has the timestamp field updated in the PE file header. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 653637f3f83f6d22682cca41ff86c6d5.
Strike DarkComet_65a19a73	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is 65a19a730f50c5daea17f95adf114c90.

Strike DarkComet_cf9031f5	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The binary has the debug flag removed in the PE file format. The MD5 hash of this DarkComet sample is cf9031f5f60e4c6dc23faa0a3a1d5b9b.
Strike DarkComet_d619583b	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is d619583b03bae980edca49feede8579c.
Strike DarkComet_d6b4318e	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is d6b4318e91f5422c2a55a9b40228a365.
Strike DarkComet_dacded52	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is dacded526944ecb98ddd58f543141c84.
Strike DarkComet_dbf7ba48	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has a random section name renamed according to the PE format specification. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system. The MD5 hash of this DarkComet sample is dbf7ba480e7019322a3c7b12bcee3060.

<b>Name</b>	<b>Description</b>
Strike DarkComet_dd9c342a	This strike sends a polymorphic malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. The binary has a random section name renamed according to the PE format specification. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is dd9c342a0c4ce50441af2794586eb243.
Strike DarkComet_df4a6de4	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is df4a6de44c1341c71251aa7b1930cf6f.
Strike DarkComet_e0ba1170	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is e0ba1170722739bd05a56e350eb08310.
Strike DarkComet_e34111d9	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is e34111d9e2ddbea03a6cd91236f4dc27.
Strike DarkComet_e439db25	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is e439db25dd10f03b22cedc55b1e47b90.
Strike DarkComet_e5df0db4	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is e5df0db41a655829f3564fb6d45f527a.
Strike DarkComet_e9398ac5	This strike sends a malware sample known as DarkComet. DarkComet and related variants are a family of remote access trojans designed to provide an attacker with control over an infected system. Capabilities of this malware include the ability to download files from a user's machine, mechanisms for persistence and hiding, and the ability to send back usernames and passwords from the infected system The MD5 hash of this DarkComet sample is e9398ac53c135781e952477e91fb02c.

Strike DarkSide_29bcd459	This strike sends a malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The MD5 hash of this DarkSide sample is 29bcd459f5ddeefad26fc098304e786.

<b>Name</b>	<b>Description</b>
Strike DarkSide_2c79d66f	This strike sends a polymorphic malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this DarkSide sample is 2c79d66f1dc05a065ad409813c60feeb.
Strike DarkSide_2f31ce15	This strike sends a malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The MD5 hash of this DarkSide sample is 2f31ce153a8f1d9e30e8ee7305ee7a6a.
Strike DarkSide_31ecfd98	This strike sends a polymorphic malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this DarkSide sample is 31ecfd9898a51b1b116d6805a7ed06b5.
Strike DarkSide_39db5648	This strike sends a malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The MD5 hash of this DarkSide sample is 39db5648c2ddef913989f51c711b1356.
Strike DarkSide_3fd9b011	This strike sends a malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The MD5 hash of this DarkSide sample is 3fd9b0117a0e79191859630148dc6d.
Strike DarkSide_47a4420a	This strike sends a malware sample known as DarkSide. DarkSide is a ransomware group that made headlines recently when it was attributed to the attack against CompuCom as well as an attack against the Colonial Pipeline, taking the major US fuel pipeline offline. The DarkSide group is known for its very specific approach to targeting victims. Each executable is carefully crafted for its intended target. The MD5 hash of this DarkSide sample is 47a4420ad26f60bb6bba5645326fa963.

Strike DarkTortilla Loader_6312c27d	This strike sends a polymorphic malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this DarkTortilla Loader sample is 6312c27d72dfca46e9dc99030ce5e944.
Strike DarkTortilla Loader_6e91ad09	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is 6e91ad0972e104a277505104abe39d1e.
Strike DarkTortilla Loader_76d32fe3	This strike sends a polymorphic malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The binary has the timestamp field updated in the PE file header. The MD5 hash of this DarkTortilla Loader sample is 76d32fe38d0b95c1736133b944b08e56.

<b>Name</b>	<b>Description</b>
Strike DarkTortilla Loader_7b31ea74	This strike sends a polymorphic malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this DarkTortilla Loader sample is 7b31ea74f3666a5c53683df6b6c98539.
Strike DarkTortilla Loader_827258f9	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is 827258f907c5087f498c413d28e2203e.
Strike DarkTortilla Loader_84872b60	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is 84872b60072011eab8940f3b49bdb582.
Strike DarkTortilla Loader_851816aa	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is 851816aa8cf45ba769f0d9420acfb3e5.
Strike DarkTortilla Loader_8d8c551d	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is 8d8c551dd572a1dc158de239b37eaa9a.
Strike DarkTortilla Loader_93fe6600	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is 93fe6600c51014d7d6c2afedf8398f92.
Strike DarkTortilla Loader_c37aae0f	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is c37aae0ff565a2e44f144f837b750279.

<b>Name</b>	<b>Description</b>
Strike DarkTortilla Loader_cd49f7c3	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is cd49f7c3c4e82dee128eedea9879bc33.
Strike DarkTortilla Loader_f44695a8	This strike sends a malware sample known as DarkTortilla Loader. DarkTortilla is a .NET-based crypter that delivers information stealers and remote access trojans like AgentTesla and RedLine. It has also been observed delivering payloads like Cobalt Strike and Metasploit as well as other malicious documents and executables. This sample is the DarkTortilla initial loader. The MD5 hash of this DarkTortilla Loader sample is f44695a8febb2a35576a59fa984629d2.
Strike Darkgate DLL_9d82885d	This strike sends a malware sample known as Darkgate DLL. This sample is a DLL associated with Darkgate. Darkgate is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. The malware employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate DLL sample is 9d82885d1f60a13f2a8d16288739684c.
Strike Darkgate Loader_645cc995	This strike sends a malware sample known as Darkgate Loader. This sample is a loader associated with Darkgate. The shellcode loader downloads, decrypts, and executes the final payload. Darkgate is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. The malware employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate Loader sample is 645cc995139d0646250eca32683afae1.

Name	Description
Strike Darkgate Loader_b4aa788e	<p>This strike sends a malware sample known as Darkgate Loader. This sample is a loader associated with Darkgate. The shellcode loader downloads, decrypts, and executes the final payload. Darkgate is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. The malware employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate Loader sample is b4aa788e1ca35302f67d344b82e6ed47.</p>
Strike Darkgate Shellcode_9ef277f5	<p>This strike sends a malware sample known as Darkgate Shellcode. This sample is a shellcode associated with Darkgate. The shellcode is responsible for executing a PE file that acts as the DarkGate loader module. Darkgate is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. The malware employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate Shellcode sample is 9ef277f5ff3ad7137e03ad3f10ca60a2.</p>
Strike Darkgate VBS_5f654c88	<p>This strike sends a malware sample known as Darkgate VBS. This sample is a VBS script associated with Darkgate. The initial VBS dropper contains obfuscated code when executed it downloads and executes a Windows batch script from the command and control (C2) server. Darkgate is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. The malware employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate VBS sample is 5f654c882635686b095afb36fd03060d.</p>

Name	Description
Strike Darkgate VBS_726bda47	<p>This strike sends a malware sample known as Darkgate VBS. This sample is a VBS script associated with Darkgate. The initial VBS dropper contains obfuscated code when executed it downloads and executes a Windows batch script from the command and control (C2) server. Darkgate is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. The malware employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate VBS sample is 726bda475bacd81fb0887a313635f3aa.</p>
Strike Darkgate_1b9e9d90	<p>This strike sends a malware sample known as Darkgate. This sample belongs to DarkGate. It is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. DarkGate employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. The MD5 hash of this Darkgate sample is 1b9e9d90136d033a52d2c282503f33b7.</p>
Strike Darkgate_2989dab1	<p>This strike sends a malware sample known as Darkgate. This sample belongs to DarkGate. It is a Remote Access Trojan (RAT) offered as Malware-as-a-Service (MaaS) which poses a formidable threat designed to achieve full system compromise. DarkGate employs extensive evasion tactics, command and control features, and modules for credential theft, keylogging, and screen capturing. It's widely adopted by cybercriminals globally. Delivery channels include phishing emails with links to Visual Basic Script (VBS) or Microsoft Software Installer (MSI) files. Recent tactics involve using collaborative apps like Microsoft Teams. The malware is delivered via a deceptive ZIP file containing Windows shortcut files, executing a Windows Batch script to retrieve, and run a remote VBS script. Strike DevOpt_db14d40d	This strike sends a malware sample known as DevOpt. DevOpt is a malware backdoor that was discovered on a Russian website attempting to lure victims into downloading the malware via the promise of monetary rewards. The malware has many capabilities including the ability to enable persistence on the targeted system, steal browser credentials, grab clipboard data, and log keystrokes. The MD5 hash of this DevOpt sample is db14d40d780853f80b93e21e92617680.
Strike DevOpt_e42198e7	This strike sends a malware sample known as DevOpt. DevOpt is a malware backdoor that was discovered on a Russian website attempting to lure victims into downloading the malware via the promise of monetary rewards. The malware has many capabilities including the ability to enable persistence on the targeted system, steal browser credentials, grab clipboard data, and log keystrokes. The MD5 hash of this DevOpt sample is e42198e7c0647238b999a2b2133daac2.

<b>Name</b>	<b>Description</b>
Strike Dharma_09abc206	This strike sends a polymorphic malware sample known as Dharma. Dharma also known as Crysis, is a trojanized ransomware in which the source code has been around for several years, leading to many variants being created. This availability and these variants lend to its popularity as a Ransomware as a Service model being adopted by cyber criminals. Dharma conceals itself inside the target system and encrypts files anytime they are added to the specified directory. Once the files are encrypted a ransom note is left providing the victim with email addresses to contact in order to pay for decryption. The binary has the debug flag removed in the PE file format. The MD5 hash of this Dharma sample is 09abc206875e17ad67f96a78db948812.
Strike Dharma_0b3f26d9	This strike sends a polymorphic malware sample known as Dharma. Dharma also known as Crysis, is a trojanized ransomware in which the source code has been around for several years, leading to many variants being created. This availability and these variants lend to its popularity as a Ransomware as a Service model being adopted by cyber criminals. Dharma conceals itself inside the target system and encrypts files anytime they are added to the specified directory. Once the files are encrypted a ransom note is left providing the victim with email addresses to contact in order to pay for decryption. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Dharma sample is 0b3f26d996dc0326a7eb88f122c21e3c.
Strike Dharma_0e54c3ae	This strike sends a malware sample known as Dharma. Dharma also known as Crysis, is a trojanized ransomware in which the source code has been around for several years, leading to many variants being created. This availability and these variants lend to its popularity as a Ransomware as a Service model being adopted by cyber criminals. Dharma conceals itself inside the target system and encrypts files anytime they are added to the specified directory. Once the files are encrypted a ransom note is left providing the victim with email addresses to contact in order to pay for decryption. The MD5 hash of this Dharma sample is 0e54c3ae592f46def82c6b153bb642c8.
Strike Dharma_142d30b8	This strike sends a polymorphic malware sample known as Dharma. Dharma also known as Crysis, is a trojanized ransomware in which the source code has been around for several years, leading to many variants being created. This availability and these variants lend to its popularity as a Ransomware as a Service model being adopted by cyber criminals. Dharma conceals itself inside the target system and encrypts files anytime they are added to the specified directory. Once the files are encrypted a ransom note is left providing the victim with email addresses to contact in order to pay for decryption. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Dharma sample is 142d30b8dc05ade27ad2707988a80495.
Strike Dharma_16335b82	This strike sends a polymorphic malware sample known as Dharma. Dharma also known as Crysis, is a trojanized ransomware in which the source code has been around for several years, leading to many variants being created. This availability and these variants lend to its popularity as a Ransomware as a Service model being adopted by cyber criminals. Dharma conceals itself inside the target system and encrypts files anytime they are added to the specified directory. Once the files are encrypted a ransom note is left providing the victim with email addresses to contact in order to pay for decryption. The binary has a new section added in the PE file format with random contents. The MD5 hash of this Dharma sample is 16335b825864a9c678c5fc316040f5f3.

<b>Name</b>	<b>Description</b>
Strike DoppelPaymer_2d1e555a	This strike sends a polymorphic malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this DoppelPaymer sample is 2d1e555aa68fcc2672e03c976203f96d.
Strike DoppelPaymer_2d49243c	This strike sends a malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. Most recently Kia Motor Company has suffered an attack from DoppelPaymer with the attackers requesting a \$27 Million dollar ransom. The MD5 hash of this DoppelPaymer sample is 2d49243c9ee70e4998362082c98e1819.
Strike DoppelPaymer_4601ec39	This strike sends a polymorphic malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The binary has random bytes appended at the end of the file. The MD5 hash of this DoppelPaymer sample is 4601ec39e2934ba61651decf6d06de64.
Strike DoppelPaymer_66c11a6c	This strike sends a polymorphic malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The binary has the timestamp field updated in the PE file header. The MD5 hash of this DoppelPaymer sample is 66c11a6cbbe59f2e580da1c75acd9ae8.
Strike DoppelPaymer_69061465	This strike sends a malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The MD5 hash of this DoppelPaymer sample is 69061465ae5067710402c832412e2dae.
Strike DoppelPaymer_81f50e95	This strike sends a malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The MD5 hash of this DoppelPaymer sample is 81f50e95bfbbe7d86229ac9592feb2f.
Strike DoppelPaymer_8c54bbe3	This strike sends a malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The MD5 hash of this DoppelPaymer sample is 8c54bbe3f191a8627bfeeb4cb02634a9.

<b>Name</b>	<b>Description</b>
Strike DoppelPaymer_a6a31da6	This strike sends a polymorphic malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this DoppelPaymer sample is a6a31da60473168dc613b64c7a00fc5e.
Strike DoppelPaymer_b2a0c322	This strike sends a polymorphic malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this DoppelPaymer sample is b2a0c322572d0f5f52d92dbd336ac14f.
Strike DoppelPaymer_c9b7413e	This strike sends a malware sample known as DoppelPaymer. DoppelPaymer ransomware is a variant of the BitPaymer ransomware. It contains source code that can be found in both Dridex and BitPaymer. It has been delivered primarily by Dridex, however, it has also been used in numerous other methods like, malspam, botnets, exploits, etc. Most recently Kia Motor Company has suffered an attack from DoppelPaymer with the attackers requesting a \$27 Million dollar ransom. The MD5 hash of this DoppelPaymer sample is c9b7413e50bfb22074734d615857a6f5.
Strike Dorkbot_14cd9f53	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 14cd9f533c23959b26089a0f3da47ebe.
Strike Dorkbot_23788137	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 237881374e70bbe9f94bbf80a5e78580.
Strike Dorkbot_27d4b49a	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary file has one more imports added in the import table. The MD5 hash of this Dorkbot sample is 27d4b49aa7890f825e97fdafb1c99b2a.
Strike Dorkbot_2c8b2adb	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 2c8b2adbe648f04b658aa9f3f4ab7ccc.

<b>Name</b>	<b>Description</b>
Strike Dorkbot_2cfa385a	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 2cfa385a368304e57a7a3918e53401cc.
Strike Dorkbot_34f8aa91	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 34f8aa917d5e78b3bbc66682d993e992.
Strike Dorkbot_3ec31a62	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 3ec31a620bb155b175f1dca19d7f3abf.
Strike Dorkbot_4e3a397f	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Dorkbot sample is 4e3a397fa3e835cf6bb5ca23268cb11a.
Strike Dorkbot_4f2fcaff	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 4f2fcaff3b068ee744b80db7474f8043.
Strike Dorkbot_535fb4c2	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 535fb4c2c630fc80bdcbc56895528027.
Strike Dorkbot_617acc95	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Dorkbot sample is 617acc95c26c60ef3b90df8f612f4da4.
Strike Dorkbot_6ce9013f	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 6ce9013ff2917fc2cb26fadf22df6bb9.

<b>Name</b>	<b>Description</b>
Strike Dorkbot_7866127d	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Dorkbot sample is 7866127daac6c9b5be81d2e01cc2f3f5.
Strike Dorkbot_79ac3809	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 79ac3809d107b030fefafa02775bb26cb5.
Strike Dorkbot_89fecc6d	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary has random bytes appended at the end of the file. The MD5 hash of this Dorkbot sample is 89fecc6df87d3a9ec5efe7deded2560e.
Strike Dorkbot_8c5d180d	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 8c5d180d78d43ec8c0754273f13f13d2.
Strike Dorkbot_9d763334	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is 9d763334a69c0c9ffcae3f99b4a3337d.
Strike Dorkbot_a42942f2	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is a42942f29b7e3084686d9c851ee53999.
Strike Dorkbot_a60ea31c	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is a60ea31cff0dbe199cbf6fbea03cc77d.
Strike Dorkbot_aa108570	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is aa108570154f9c81cc9e2be856f15222.

<b>Name</b>	<b>Description</b>
Strike Dorkbot_ae4bf237	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is ae4bf237bdcb56fc66d4ab3f7eefc647.
Strike Dorkbot_b8c9fdf0	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is b8c9fdf04315e62badffe4ca393de3b5.
Strike Dorkbot_b901c4d9	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is b901c4d9c76b378adb8919ae3dfa932c.
Strike Dorkbot_bec351f6	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is bec351f63f70e048f5319f8f5a386bf0.
Strike Dorkbot_c35270cf	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is c35270cfbadd4cff99be4fd906ed4b49.
Strike Dorkbot_c8e632b8	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary has the checksum removed in the PE file format. The MD5 hash of this Dorkbot sample is c8e632b867a715c2174bb3743d600372.
Strike Dorkbot_e2a567c0	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is e2a567c007c4446356a8b4c170eaa73d.
Strike Dorkbot_e2ffab46	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is e2ffab464f6be4b25d126ff9d1c51449.

<b>Name</b>	<b>Description</b>
Strike Dorkbot_f42c2687	This strike sends a malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The MD5 hash of this Dorkbot sample is f42c2687a386ea74defec16a76be7b85.
Strike Dorkbot_fd964c0b	This strike sends a polymorphic malware sample known as Dorkbot. Dorkbot is a worm that spreads itself through social networking sites and messaging apps. Once installed, the infected computer becomes part of a botnet, allowing the controller to control the machine remotely. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Dorkbot sample is fd964c0b89402a947716fdaddf0bf800.

This malware has been leveraged in campaigns that utilize fake captcha pages to trigger a powershell script to download and execute the EddieStealer payload. The MD5 hash of this EddieStealer sample is c8c3e658881593d798da07a1b80f250c.
Strike Elephant Dropper_06124da5	This strike sends a malware sample known as Elephant Dropper. SaintBear also known as UAC-0056 or UNC2589 is a malicious threat actor group that has been tied to the WhisperGate and WhisperKill attacks against Ukraine. Elephant is a campaign that begins as a phishing email that contains a macro embedded Microsoft Excel document that drops a Microsoft signed Elephant Dropper named 'Base-Update.exe' written in Golang. The dropper decodes a C2 address and retrieves the Elephant Downloader named 'java-sdk.exe'. The downloader, also written in Golang, retrieves the final stages of the attack the Elephant Implant and the Elephant Client. The Implant named 'oracle-java.exe' also known as GrimPlant backdoor allows the malware to communicate to the C2 via RPC requests. The Elephant Client named 'microsoft-cortana.exe' also known as Graph Steel backdoor steals user information like Wifi data and browser credentials. This sample is the Elephant Dropper. The MD5 hash of this Elephant Dropper sample is 06124da5b4d6ef31dbfd7a6094fc52a6.
Strike Embargo_0b190460	This strike sends a malware sample known as Embargo. Embargo is ransomware that is delivered as a part of a Rust-based toolkit. This toolkit consists of a loader, EDR killer, MDeployer and MS4Killer. Embargo utilizes Rust to allow for cross platform compilation. The group provides Ransomware-as-a-Service and utilizes double extortion as well by threatening to publish stolen data to leak sites. The MD5 hash of this Embargo sample is 0b1904602a90ed190066095f29a3f92a.
Strike Embargo_5d55fb70	This strike sends a malware sample known as Embargo. Embargo is ransomware that is delivered as a part of a Rust-based toolkit. This toolkit consists of a loader, EDR killer, MDeployer and MS4Killer. Embargo utilizes Rust to allow for cross platform compilation. The group provides Ransomware-as-a-Service and utilizes double extortion as well by threatening to publish stolen data to leak sites. The MD5 hash of this Embargo sample is 5d55fb708834d5ccde15d36554ea63e8.

<b>Name</b>	<b>Description</b>
Strike Embargo_dbf8fe8b	This strike sends a malware sample known as Embargo. Embargo is ransomware that is delivered as a part of a Rust-based toolkit. This toolkit consists of a loader, EDR killer, MDeployer and MS4Killer. Embargo utilizes Rust to allow for cross platform compilation. The group provides Ransomware-as-a-Service and utilizes double extortion as well by threatening to publish stolen data to leak sites. The MD5 hash of this Embargo sample is dbf8fe8bde46ead1bc550a03ad4a3f74.
Strike Embargo_f0ac3999	This strike sends a malware sample known as Embargo. Embargo is ransomware that is delivered as a part of a Rust-based toolkit. This toolkit consists of a loader, EDR killer, MDeployer and MS4Killer. Embargo utilizes Rust to allow for cross platform compilation. The group provides Ransomware-as-a-Service and utilizes double extortion as well by threatening to publish stolen data to leak sites. The MD5 hash of this Embargo sample is f0ac3999d4020cd051052a0627a2056d.
Strike Emotet_007a2eae	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 007a2eae29bc5bfa2eec17ae8104f61e.
Strike Emotet_0333ae5d	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 0333ae5de2a0d61a36fcdfbbb28e977.
Strike Emotet_060060f9	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Emotet sample is 060060f91dfd30f989bb1e9704addfee.
Strike Emotet_061262ce	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 061262ce488b46d0252fdc21d3d4bc7f.
Strike Emotet_07697f8d	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 07697f8df7d43a8417d53d493c78190b.
Strike Emotet_07a132c1	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 07a132c19d1feaecd623e3c271134af2.

<b>Name</b>	<b>Description</b>
Strike Emotet_087117e5	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 087117e537d3c15a3d74a240e07c632c.
Strike Emotet_09a87f23	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 09a87f23ccd5a5459bfb443faffd76f1.
Strike Emotet_0ae74d12	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 0ae74d12e881daf1de8c05d48a6f5867.
Strike Emotet_0b422cc0	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 0b422cc0719a274d2da0e23d68091b41.
Strike Emotet_1034405a	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has the debug flag removed in the PE file format. The MD5 hash of this Emotet sample is 1034405a7a4f24541844597170e8467f.
Strike Emotet_10717df4	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 10717df40000d7f0575ccefa8ef064c5.
Strike Emotet_193e710f	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 193e710f76dbb30bf8b0fc0168a13a3d.
Strike Emotet_1a6995e8	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 1a6995e8668456e77f554af0dc360b7f.

Strike Emotet_1cf9f32e	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Emotet sample is 1cf9f32e7c95143df2125a20cb8d5ff.
Strike Emotet_1d6b71de	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 1d6b71ded16731da9f674977017a1b46.
Strike Emotet_1df512f0	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 1df512f03d79ca0a67d084914fb84cc1.
Strike Emotet_2082c7d3	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 2082c7d38e1a7296dd6c49582d1c5fd0.
Strike Emotet_20ad8937	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 20ad893754a3df823fa368fe84e51a8a.
Strike Emotet_212ede8e	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 212ede8ee978a5979b17d9d68a497d10.
Strike Emotet_22d632bd	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has the checksum removed in the PE file format. The MD5 hash of this Emotet sample is 22d632bddf6ea7f623a15414b9b63669.
Strike Emotet_23b8353f	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 23b8353fa069bd2e95cb726e0382b674.

<b>Name</b>	<b>Description</b>
Strike Emotet_23fe2956	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 23fe29563e7cae4a432566c693bbc9ca.
Strike Emotet_24e3a9e0	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary file has one more imports added in the import table. The MD5 hash of this Emotet sample is 24e3a9e0e4b9139977cd4776c73edfc3.
Strike Emotet_270d4a7c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 270d4a7cd0dc8f8aa84619dbcfdb13.
Strike Emotet_2a0d4de9	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 2a0d4de98de7038d61185c4fcfa5e0b6.
Strike Emotet_2c8fd0a8	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 2c8fd0a8e770e5944ae20aa5c3f45e1a.
Strike Emotet_2ff6f44d	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 2ff6f44d228c8fc133d53f7002552b2a.
Strike Emotet_31457286	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 314572861360db51d2d49afb464d4a72.
Strike Emotet_35989c84	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has been packed using upx packer, with the default options. The MD5 hash of this Emotet sample is 35989c844a2a70f6965b8a0559af7455.

<b>Name</b>	<b>Description</b>
Strike Emotet_3d0b6c5c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 3d0b6c5cb6699ab80d09a35dc8ff7195.
Strike Emotet_3da1215c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 3da1215cabb6bb88d9a1432f78df501e.
Strike Emotet_3da98789	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 3da9878997705570052d1a3ae3270671.
Strike Emotet_3e9f7bc3	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 3e9f7bc31ba3adb2638de4ebec51df91.
Strike Emotet_3eb9a044	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 3eb9a044ac8c8f5685c9b43deb4c8755.
Strike Emotet_4247302f	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 4247302ff7876d70434aa55bf65fe7e1.
Strike Emotet_4249fe0b	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 4249fe0bca2c3b5b5cb48d42814cefbb.
Strike Emotet_42a50d33	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 42a50d33c68d817c700f1bbbb79b6c83.
Strike Emotet_43464293	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 4346429384893a6f9d4a25e2abae8bc2.

<b>Name</b>	<b>Description</b>
Strike Emotet_44fff49e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 44fff49e71649e36c9f873289f144afb.
Strike Emotet_46d69f8e	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 46d69f8e1deebb60b276e62047b7ea8e.
Strike Emotet_498307c2	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Emotet sample is 498307c24d3857a0300974df6787faf0.
Strike Emotet_4a17b559	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 4a17b55969581f2b7a69e1f26d9a88e9.
Strike Emotet_4b9584ee	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 4b9584eec0429d422bca4eb61e3acd5e.
Strike Emotet_4c5d5d22	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Emotet sample is 4c5d5d22aeeec6ef3e98136bd9d3e20ec.
Strike Emotet_4db1818e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 4db1818e989157ec2477fa8587d69033.
Strike Emotet_4e27e219	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 4e27e2197bda5e1318eb13ea06b18205.

<b>Name</b>	<b>Description</b>
Strike Emotet_501b6b39	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 501b6b3922ce1d5b7d555a429404e95b.
Strike Emotet_51e25f03	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 51e25f0318a7870bafa3ca4e6e419024.
Strike Emotet_52316a19	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 52316a19d6a9ce260ca3e63a56168de8.
Strike Emotet_524e824a	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 524e824ac17c816c0bd50ffae623507.
Strike Emotet_544de53a	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 544de53a55edbad56db93c07002f7ec0.
Strike Emotet_553e53c9	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 553e53c975d2ff6346302210a2145b14.
Strike Emotet_5601cc2b	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5601cc2bfc8ea64170bec29817fe2c5a.
Strike Emotet_56b39a66	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 56b39a662e0b6bbb1ff4c2698a909407.
Strike Emotet_571ad3e0	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 571ad3e0d627ea0b6acb95f9e35e0661.

<b>Name</b>	<b>Description</b>
Strike Emotet_57674369	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 57674369f83c58d391eff88877f0fce2.
Strike Emotet_577a8dcc	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 577a8dcc160796201bf93e2a829edbee.
Strike Emotet_5870c54f	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has the checksum removed in the PE file format. The MD5 hash of this Emotet sample is 5870c54fd187968c3c347703bd59ab1d.
Strike Emotet_5a53c95e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5a53c95ec818e32cec3e647a41420fb.
Strike Emotet_5ba6287e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5ba6287e4ade00a379c143507cb72822.
Strike Emotet_5c8b4114	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5c8b41146f1e86614cd33ca08a60b701.
Strike Emotet_5dba15ae	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5dba15aec0800e03cac012455c47504c.
Strike Emotet_5e15ca4c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5e15ca4c570e54853e6663c0783b4f51.

<b>Name</b>	<b>Description</b>
Strike Emotet_5ee3d0bb	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 5ee3d0bb7042031785c185e3402f8298.
Strike Emotet_61214202	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 61214202b2cf47ac495e9a26dd967ab1.
Strike Emotet_6213f591	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 6213f5911227d1c1a3e16c44734ecd61.
Strike Emotet_62ff36ab	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Emotet sample is 62ff36ab8ff180c7e849bf2b70cbe858.
Strike Emotet_64c5ac3e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 64c5ac3e5f42ff74c1a174513517e894.
Strike Emotet_6828a7a0	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 6828a7a021d602c0866f83ad82404ab2.
Strike Emotet_686123fc	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 686123fcce69aac06a9d4d3aa0c9a84b.
Strike Emotet_68b36e7e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 68b36e7efd2a6f2b24893650e30e15ea.

<b>Name</b>	<b>Description</b>
Strike Emotet_68d5c1d0	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 68d5c1d02f043dce930ccc33681d3b32.
Strike Emotet_69833f53	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 69833f53d536888fc2c2d533b33c571d.
Strike Emotet_699bd905	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 699bd9053663bbdeb39df9d6f4f2b483.
Strike Emotet_69db12ac	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 69db12acb99d3b6e65ba54df9d15f264.
Strike Emotet_6a874f58	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 6a874f582aa5cf1c75a52c5ed8e8a92.
Strike Emotet_6b7e027f	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 6b7e027f357b49fbff377dd6981d3873.
Strike Emotet_6b8e4dc4	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has been packed using upx packer, with the default options. The MD5 hash of this Emotet sample is 6b8e4dc413f5f37594d193dda39efe9.
Strike Emotet_6bd3cdbf	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 6bd3cdbf9a8d0125e295c8c34f94b3ec.

The MD5 hash of this Emotet sample is 77f8dc9a261d51a58f653f990d0547b5.
Strike Emotet_7e8708c2	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 7e8708c2095b5b3bd833f96fc20e4dc7.
Strike Emotet_7e971bb3	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 7e971bb31ffe50dd3ed63f388881229d.
Strike Emotet_82c1170c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 82c1170c14c34f977c5a1d7ff26da6f1.
Strike Emotet_86c8733c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 86c8733c7bbafc20abc4d91eab8faca5.
Strike Emotet_87ef8852	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 87ef88526bb7178f95a43099a8225dd0.
Strike Emotet_882439a0	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Emotet sample is 882439a02af524719ca974b0925d42c9.
Strike Emotet_88cc1c60	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 88cc1c601c28901033abec4389854884.

<b>Name</b>	<b>Description</b>
Strike Emotet_8cdace86	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 8cdace8642fe8dd4c649bf6a9dc6d632.
Strike Emotet_8dde30a4	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 8dde30a43ef9d22ec22c1d7bcec31b20.
Strike Emotet_90198f7c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 90198f7cc5a722554e939f84d8dcb97d.
Strike Emotet_90e32b98	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 90e32b98e17eead923b4ef0159deb1fc.
Strike Emotet_91adac33	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 91adac33b6d93c6991e2cfb4530a6464.
Strike Emotet_93835135	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 938351350f6df43ec1aa024352175807.
Strike Emotet_97e77c7d	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is 97e77c7db614b3304ea6ef7a598697fb.
Strike Emotet_9826fccb	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9826fccb9fe8ccb6e3486b997fa65a2e.
Strike Emotet_987e06f9	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 987e06f9676abb7ea38b10912c649637.

<b>Name</b>	<b>Description</b>
Strike Emotet_9a45c567	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9a45c5675acd860cd45950be5f300546.
Strike Emotet_9a8f5a8c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9a8f5a8cd29c49c49890edcae1f3a2d9.
Strike Emotet_9aa171b7	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9aa171b75821e33cfda05772d22f6930.
Strike Emotet_9b638d31	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9b638d312db2f61f37c5aa02b136f7c4.
Strike Emotet_9be366b8	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Emotet sample is 9be366b807f0599182773345a95fa466.
Strike Emotet_9c270b9a	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9c270b9a074f8e866af32a369e65aa87.
Strike Emotet_9db82b4e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is 9db82b4e3957bf1d62d7526821b12d62.
Strike Emotet_a047e8bc	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is a047e8bc82f34dffefd1748eee7a7160.

<b>Name</b>	<b>Description</b>
Strike Emotet_a0c0c876	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is a0c0c876217f30ee39fd06de0fc8f57.
Strike Emotet_a2935c23	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is a2935c23622f35302f4b43121d62727b.
Strike Emotet_a30ba05c	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is a30ba05c61d91c62087ef7bbbb054f50.
Strike Emotet_a6ae4aaf	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is a6ae4aaf85b21a4b811504d50054bb13.
Strike Emotet_aa748718	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is aa748718088e7bb3da20377603dd39a9.
Strike Emotet_ab3cfa53	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is ab3cfa539864768c3f40d148911a6dce.
Strike Emotet_ab6e5de9	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is ab6e5de935d30d6ecedccf1296cd4ba8.
Strike Emotet_ac1464a7	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is ac1464a7af3438caeccc8d4bc797fc59.
Strike Emotet_ae7bec88	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is ae7bec88c8bf1ce8c445ec160df957fa.

The MD5 hash of this Emotet sample is e1b3e16bd44ea7957e00bbf5bfbd92d6.
Strike Emotet_e1c97191	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is e1c97191eae9b1537778fc88220c44ed.
Strike Emotet_e3740306	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is e37403061d0fc0c796f6d107b7c79492.
Strike Emotet_e45b696e	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is e45b696e11a9b63bc735dac36e2e81f3.

<b>Name</b>	<b>Description</b>
Strike Emotet_e4de4b24	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is e4de4b24bf98b3af0b5732a10e5a159f.
Strike Emotet_e73d0b88	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is e73d0b8841158cc52a3f52c1162b4f1a.
Strike Emotet_e7902137	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is e79021377681dd21a34ea9a4d33dfbf6.
Strike Emotet_eb1db6d0	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is eb1db6d06bccf86bc8d8240cda956938.
Strike Emotet_ef389a78	This strike sends a malware sample known as Emotet. Emotet is one of the most distributed active malware families today. It is modular malware in that it can deliver various payloads. Emotet often comes from Microsoft Office document macros, that is sent with malicious emails. The MD5 hash of this Emotet sample is ef389a7806af11a628bcce9be3897f72.
Strike Emotet_ef569bb3	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has been packed using upx packer, with the default options. The MD5 hash of this Emotet sample is ef569bb3d1670f0a4cbed0b8be1475fb.
Strike Emotet_f2110b23	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is f2110b231bf6209e17b59f232ca21b94.
Strike Emotet_f2a4366a	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is f2a4366aa466a11ccf4ebff87b275e17.

<b>Name</b>	<b>Description</b>
Strike Emotet_f593ee31	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is f593ee319ae20d58340113b6d1a1e23c.
Strike Emotet_f81c62a7	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is f81c62a7bed4734b55bdb6d123449022.
Strike Emotet_f889195d	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is f889195d7fb07a26bb6597e61d659257.
Strike Emotet_f9c9f904	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is f9c9f904c00f64da4b188e5f3677097d.
Strike Emotet_fb3a1577	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is fb3a157718a1851fe9fccde52c5b7e11.
Strike Emotet_fc153f23	This strike sends a malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The MD5 hash of this Emotet sample is fc153f23c7f5c1d226313335dd7904eb.
Strike Emotet_fdb16564	This strike sends a polymorphic malware sample known as Emotet. Emotet is one of the most widely distributed and active malware families today. It is a highly modular threat that can deliver a variety of payloads. Emotet is commonly delivered via Microsoft Office documents with macros, sent as attachments on malicious emails. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Emotet sample is fdb16564b8d78cc7b97715394e958c64.
Strike ExelaStealer PDF executable_54293289	This strike sends a malware sample known as ExelaStealer PDF executable. ExelaStealer is a sophisticated and elusive Python-based malware. The malware primarily targets Discord users by modifying the Windows Discord client to steal sensitive information, including login credentials, personal data, and financial information, as well as session details from different online apps, social media services, and gaming platforms. This sample is the executable that launches the pdf viewer. The MD5 hash of this ExelaStealer PDF executable sample is 5429328937ed51076df9f8c4e5edc93a.

<b>Name</b>	<b>Description</b>
Strike ExelaStealer PDF executable_a774e196	This strike sends a malware sample known as ExelaStealer PDF executable. ExelaStealer is a sophisticated and elusive Python-based malware. The malware primarily targets Discord users by modifying the Windows Discord client to steal sensitive information, including login credentials, personal data, and financial information, as well as session details from different online apps, social media services, and gaming platforms. This sample is the executable that launches the pdf viewer. The MD5 hash of this ExelaStealer PDF executable sample is a774e1965dea429e097e4a3e1bef0943.
Strike ExelaStealer Runtime Broker_5c7805f8	This strike sends a malware sample known as ExelaStealer Runtime Broker. ExelaStealer is a sophisticated and elusive Python-based malware. The malware primarily targets Discord users by modifying the Windows Discord client to steal sensitive information, including login credentials, personal data, and financial information, as well as session details from different online apps, social media services, and gaming platforms. This sample is an executable. The MD5 hash of this ExelaStealer Runtime Broker sample is 5c7805f87a6e396231a360a4f350378f.
Strike ExelaStealer Runtime Broker_8b594b44	This strike sends a malware sample known as ExelaStealer Runtime Broker. ExelaStealer is a sophisticated and elusive Python-based malware. The malware primarily targets Discord users by modifying the Windows Discord client to steal sensitive information, including login credentials, personal data, and financial information, as well as session details from different online apps, social media services, and gaming platforms. This sample is an executable. The MD5 hash of this ExelaStealer Runtime Broker sample is 8b594b44addb55ebac34806dd0935181.
Strike Exorcist_0d256ab0	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is 0d256ab0a8b8b7a3b3d4aaf566189ca6.
Strike Exorcist_4908a364	This strike sends a polymorphic malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory.The binary has the debug flag removed in the PE file format. The MD5 hash of this Exorcist sample is 4908a364b1d9467f2c9c3fcecccba202.
Strike Exorcist_55e43a8a	This strike sends a polymorphic malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory.The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Exorcist sample is 55e43a8a489e4c9756a6375a15b2f102.
Strike Exorcist_5a63e7d3	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is 5a63e7d371dd69c5625f5b48da426c14.
Strike Exorcist_79385ed9	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is 79385ed97732aee0036e67824de18e28.

<b>Name</b>	<b>Description</b>
Strike Exorcist_7e415d5a	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is 7e415d5a1b1235491cb698eb14817d31.
Strike Exorcist_8cc13fea	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is 8cc13fea61cc0ba1382a779ee46726f0.
Strike Exorcist_cb3a1463	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is cb3a1463f4fd3e74b8f1ca5e73b81816.
Strike Exorcist_d4d32e75	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is d4d32e7583b3fd8363ded73c91ed3d08.
Strike Exorcist_e763b9a8	This strike sends a polymorphic malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The binary has been packed using upx packer, with the default options. The MD5 hash of this Exorcist sample is e763b9a8460c2dc9a1229d0c8bf71ab4.
Strike Exorcist_f188cf26	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is f188cf267d209a0209a25bda4bb75b86.
Strike Exorcist_f4009abe	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is f4009abe9f41da41e48340c96e29d62c.
Strike Exorcist_fa4c4ac8	This strike sends a malware sample known as Exorcist. Exorcist is a new ransomware as a service that is distributed through Pastebin embedded in a Powershell script that loads itself directly in memory. The MD5 hash of this Exorcist sample is fa4c4ac8b9c1b14951ae8add855f34e8.
Strike Expilo_006d69c5	This strike sends a malware sample known as Expilo. Expilo or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expilo sample is 006d69c55af445e249fa154e4f31e55a.
Strike Expilo_0155baf3	This strike sends a malware sample known as Expilo. Expilo also known as Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expilo sample is 0155baf3b793202061b0c43ca7c9cec2.

<b>Name</b>	<b>Description</b>
Strike Expiro_01eeb5c6	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 01eeb5c6a9382fe8bc0691971dcda6da.
Strike Expiro_02191a87	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 02191a875603620180d8e1ce5766176a.
Strike Expiro_0413d149	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 0413d149c8f13c37c59b4045d19e104b.
Strike Expiro_04e0b84b	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 04e0b84b8474dcefbc68b7782cf61fa3.
Strike Expiro_0e9dcdba	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 0e9dcdba66ee4d9753292f4112a4537b.
Strike Expiro_128f886f	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 128f886f38ce715bfbe08fedd12e0173.
Strike Expiro_17661350	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 1766135009a50699dd4746150e78d14d.
Strike Expiro_1abac5c7	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 1abac5c78347e86a9b1969037cad5e5e.
Strike Expiro_1f0e8f82	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 1f0e8f826901b1a0ee03d9f73f48609c.
Strike Expiro_21c224a0	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 21c224a0e05ba44213104e8f4ae66132.
Strike Expiro_250f4f91	This strike sends a malware sample known as Expiro. Expiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 250f4f917a22885c0ee7fe96f6743c7a.
Strike Expiro_2f1f1c29	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 2f1f1c29323c486eb5e256a8c1f16050.

<b>Name</b>	<b>Description</b>
Strike Expiro_30f54fca	This strike sends a malware sample known as Expiro. Expiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 30f54fcac7e14e7cb1cc22bcca545a60.
Strike Expiro_31b46dee	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 31b46dee8917e8d73638bc3cca7c64ce.
Strike Expiro_34c50d3b	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 34c50d3baf3bfdc586c0a5127f2d1199.
Strike Expiro_35e46887	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 35e46887a497633076821bc083f29dff.
Strike Expiro_396b70ca	This strike sends a malware sample known as Expiro. Expiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 396b70ca9866d732f8a3912d30743237.
Strike Expiro_3daeaa3b8	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 3daeaa3b8bbb4ead9495ee4aff49b3a83.
Strike Expiro_3f328551	This strike sends a malware sample known as Expiro. Expiro or Xpiro is a known file infector and information-stealer that hinders analysis with anti-debugging and anti-analysis tricks. The MD5 hash of this Expiro sample is 3f328551144c693d7e93d15929b61f73.

Strike FROZEN#SHADOW JS_21c1d4d1	This strike sends a malware sample known as FROZEN#SHADOW JS. This malware is part of the FROZEN#SHADOW malware campaign. The campaign begins with a phishing email that redirects to a site to download a malicious obfuscated javascript file. This malware sample is that file. Once manually executed, it attempts to map a remote network drive to execute a .msi package. This package will then download and run the SSLoad malware payload. From here persistence is established on the victim machine and remote C2 communication is established which enables a host of options for the attacker including downloading and running Cobalt Strike. The MD5 hash of this FROZEN#SHADOW JS sample is 21c1d4d17e9305046d5e019d752aa33b.

Strike FROZEN#SHADOW JS_efbe4a17	<p>This strike sends a malware sample known as FROZEN#SHADOW JS. This malware is part of the FROZEN#SHADOW malware campaign. The campaign begins with a phishing email that redirects to a site to download a malicious obfuscated javascript file. This malware sample is that file. Once manually executed, it attempts to map a remote network drive to execute a .msi package. This package will then download and run the SSLoad malware payload. From here persistence is established on the victim machine and remote C2 communication is established which enables a host of options for the attacker including downloading and running Cobalt Strike. The MD5 hash of this FROZEN#SHADOW JS sample is efbe4a17de6c0a8b251106225bf5f61f.</p>

<b>Name</b>	<b>Description</b>
Strike FinancialFraud_24704575	This strike sends a polymorphic malware sample known as Financial Fraud APK. The android malware disguises as a law enforcement app, deceiving victims into downloading it for a fake fraud investigation. Once installed, it blocks incoming calls and SMS messages, isolating victims from genuine alerts about financial fraud. By blocking calls and SMS, the app isolates victims, preventing legitimate alerts about fraud. The app further gains permissions to make calls and receive SMS messages, enabling control over communications. 'com.lfedajfl' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 247045753ccbb8cccd6a567d00641858b.

Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 271576e1886df2ea54fab470fba2fcc.
Strike Flodrix_295a83c4	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 295a83c4d643f3f89ca87b45fd888a2f.

<b>Name</b>	<b>Description</b>
Strike Flodrix_34fe0e8a	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 34fe0e8a3270379ce8696a856b501afe.
Strike Flodrix_3970432b	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 3970432b39416722f1abdfb1e249b534.
Strike Flodrix_39b1f49b	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 39b1f49ba958abaea54aa219c365270a.
Strike Flodrix_55d449a1	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 55d449a1050aef47e52731bfd4339de5.
Strike Flodrix_70cc5f0a	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is 70cc5f0a17d7806eedc3d67774a9bfc6.

Strike Flodrix_bef8fc7f	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is bef8fc7f880e03f48e0efba57f1a3374.
Strike Flodrix_d629b5f5	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is d629b5f5a0971a1ef2262f6197f76466.

<b>Name</b>	<b>Description</b>
Strike Flodrix_da622893	This strike sends a malware sample known as Flodrix. This strike sends a malware sample known as Flodrix. Flodrix is a Linux-based botnet malware linked to the LeetHozer family. It is delivered through exploitation of CVE-2025-3248 in vulnerable Langflow servers. Once deployed, Flodrix establishes C2 communication and launches multi-vector DDoS attacks such as tcpraw, udpplain, and tcplegit. The malware employs evasion capabilities like process deception, artifact cleanup, and conditional self-deletion, while supporting cross-architecture payloads via versatile downloader scripts. The MD5 hash of this Flodrix sample is da62289386b20d8691ec5115be1cb368.
Strike FluBot_3a0db08d	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 3a0db08d86d3d57edea7d52843f32761.
Strike FluBot_4125019b	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 4125019bb3370f1f659f448a5727357c.
Strike FluBot_6d879ac0	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 6d879ac01f7a26d62b38d9473626a328.
Strike FluBot_749510b3	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 749510b3010a45fea2d2763476e17511.
Strike FluBot_7b4fd668	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 7b4fd668a684e9bb6d09bcf2ebadfd2.

<b>Name</b>	<b>Description</b>
Strike FluBot_891d5d2c	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 891d5d2c397e9ad5fed5685f78657d4b.
Strike FluBot_8b6c4905	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 8b6c4905f8f93af27e60b502621e03f6.
Strike FluBot_9ef4f52a	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is 9ef4f52a6ed459eab6311a4a886ec1ea.
Strike FluBot_a45dc99d	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is a45dc99d0d146524d608691f86d00d63.
Strike FluBot_c10d38a6	This strike sends a malware sample known as FluBot. FluBot is a mobile Android malware that is part of a SMS campaign that spoofs different logistics companies like Fedex and DHL by giving the user a notification to install the application in order to locate a package. Once installed the application clones realistic logistic web sites to send the user credentials back to a C2 server. The malware exfiltrates other user data like contacts list in order to spam contacts. The MD5 hash of this FluBot sample is c10d38a63e776e5940d281bddbb497d4.
Strike ForestTiger_9c860ec3	This strike sends a malware sample known as ForestTiger. ForestTiger is a backdoor payload that has been identified in the Diamond Sleet North Korean cyber attacks against TeamCity servers. After it is downloaded via powershell and executed, it decrypts the C2 configuration file, creates a scheduled task and dumps credentials. The MD5 hash of this ForestTiger sample is 9c860ec31e77c73805372299e36e4473.

<b>Name</b>	<b>Description</b>
Strike ForestTiger_fff1e249	This strike sends a malware sample known as ForestTiger. ForestTiger is a backdoor payload that has been identified in the Diamond Sleet North Korean cyber attacks against TeamCity servers. After it is downloaded via powershell and executed, it decrypts the C2 configuration file, creates a scheduled task and dumps credentials. The MD5 hash of this ForestTiger sample is fff1e24971d48bb8884dee321f93c0f5.
Strike Formbook_01808133	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 01808133083391521ebac24a87e78dd7.
Strike Formbook_04bdc16c	This strike sends a polymorphic malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Formbook sample is 04bdc16ce9fac909ff5f70444c45c160.
Strike Formbook_0912eed1	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 0912eed158ab6a7f1c0ee050ae08b4dc.
Strike Formbook_09832f42	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 09832f42326e63a715e22cc8c54b0600.
Strike Formbook_0bff8d0d	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 0bff8d0d01a06645782ecea620ac5fc.
Strike Formbook_0c8e247e	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 0c8e247e7049fe06bfcc96aa48de0f.
Strike Formbook_0d6b09e8	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 0d6b09e8ded8569b94bc181419a4b3db.
Strike Formbook_137f641f	This strike sends a polymorphic malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The binary file has one more imports added in the import table. The MD5 hash of this Formbook sample is 137f641fab0889a53ce35c1e945ff143.
Strike Formbook_1841788c	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 1841788c0f23da54626ce38767caea99.

<b>Name</b>	<b>Description</b>
Strike Formbook_1ee76569	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 1ee765692e594d7a016424e6515bfe1f.
Strike Formbook_27765727	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 27765727c5049dc8be15211d83f12326.
Strike Formbook_2983786e	This strike sends a polymorphic malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Formbook sample is 2983786eb8a2877879dd7bbb2bafc8ae.
Strike Formbook_2a414be7	This strike sends a polymorphic malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The binary has the checksum removed in the PE file format. The MD5 hash of this Formbook sample is 2a414be7c6dea6d4d1bfd77c3e9c9b25.
Strike Formbook_2ba0a2a0	This strike sends a polymorphic malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The binary has random bytes appended at the end of the file. The MD5 hash of this Formbook sample is 2ba0a2a0b3fb79d8a72b992860e00c10.
Strike Formbook_329f7e4e	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 329f7e4e00314e9cb074d15b2347df16.
Strike Formbook_376dd288	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 376dd2886e40bf04651900326d436943.
Strike Formbook_3887644a	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 3887644a8b40a31b9916c390acff825c.
Strike Formbook_3915ee59	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 3915ee5917342673cd8edf72819784e6.
Strike Formbook_395b256d	This strike sends a polymorphic malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Formbook sample is 395b256db9fe92555d8ffbcd63331d4.

<b>Name</b>	<b>Description</b>
Strike Formbook_3e1ffccb	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 3e1ffccb84319f3691ca70978d0133da.
Strike Formbook_3e413c65	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 3e413c65154648fe22b554398986ae4d.
Strike Formbook_4131d35e	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 4131d35ec6a865907eddc8faa8cce33.
Strike Formbook_42e783c3	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 42e783c3fce437f1ea7eaa89c45b31e6.
Strike Formbook_440e6d38	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 440e6d387a6a202fb695171cdd90e9f0.
Strike Formbook_44bf8f92	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 44bf8f92e9f2f06894bc8b897202baf4.
Strike Formbook_457f3c74	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 457f3c7400382ec8ebe7885d1c666aeb.
Strike Formbook_495b6897	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 495b689701ab45f119a9ec53810e0e09.
Strike Formbook_49fa2aec	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 49fa2aecca84c2cccd83b20297143646.
Strike Formbook_4b5e6a79	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 4b5e6a79736d1e17a28120d6002de95c.
Strike Formbook_4c2e538c	This strike sends a malware sample known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 4c2e538cb6b68a7d8c36cdfcd1a845ef.

<b>Name</b>	<b>Description</b>
Strike Formbook_4d3c739b	This strike sends a malware sample known as Formbook. This malicious sample is known as Formbook. Formbook is an information stealer that attempts to collect sensitive information from the target. The MD5 hash of this Formbook sample is 4d3c739bab68b3eea8cd032aef303525.

Strike Gamarue_a208ad70	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is a208ad7018437136b64d2f4c1af7c747.
Strike Gamarue_aef60c6d	This strike sends a polymorphic malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The binary has random bytes appended at the end of the file. The MD5 hash of this Gamarue sample is aef60c6d7f959e086091da6e009bf27d.
Strike Gamarue_bae65735	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is bae6573551f8db9dff7435e48c237c7f.
Strike Gamarue_c53222ea	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is c53222eacadfe39272f6fcf3303c2e98.

<b>Name</b>	<b>Description</b>
Strike Gamarue_cca88bd6	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is cca88bd68a1ba8bfdca268cace9a27f6.
Strike Gamarue_d55fe6fa	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is d55fe6fa8d2ba3c2c6300a71990f38c2.
Strike Gamarue_e3752433	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is e3752433d62f4dbf29345aa5ecacafa9.
Strike Gamarue_e438a983	This strike sends a polymorphic malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Gamarue sample is e438a983fb2dc274d39702d4a860df15.
Strike Gamarue_e8c5bb4f	This strike sends a polymorphic malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Gamarue sample is e8c5bb4f6d9ed4ec046cb8989dba860e.
Strike Gamarue_e9ec1a06	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is e9ec1a063f0d557bfec2b04153b20cbe.

<b>Name</b>	<b>Description</b>
Strike Gamarue_fde8fb71	This strike sends a malware sample known as Gamarue. Win.Trojan.Gamarue covers a family that, after installing itself on the system to survive after reboot, will spread itself to USB drives and modify system configuration settings to weaken its security and disable certain features, such as the task manager or the Windows shell, in order to protect itself. It can exfiltrate sensitive data and receive additional commands. The MD5 hash of this Gamarue sample is fde8fb71e98e02c81f20004bba7919f7.
Strike Gandcrab_1c6b014e	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is 1c6b014e86d887ef235adbcdce8c23a7f.
Strike Gandcrab_22bc40bd	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is 22bc40bd16d93b14848a4e49b708c8a0.
Strike Gandcrab_6704dc8f	This strike sends a polymorphic malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Gandcrab sample is 6704dc8f351350724184257996f9066b.
Strike Gandcrab_7dc8699e	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is 7dc8699e71e067f3cd4600c2c4fd4a9f.
Strike Gandcrab_81740cc0	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is 81740cc0d01c2b9841f1946dadab4263.
Strike Gandcrab_8b73329e	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is 8b73329e7fbe4ea24e9b814c6fe3c61d.

<b>Name</b>	<b>Description</b>
Strike Gandcrab_9bfb2b63	This strike sends a polymorphic malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Gandcrab sample is 9bfb2b6312ba962055b988777e1ee99c.
Strike Gandcrab_9c8a7882	This strike sends a polymorphic malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Gandcrab sample is 9c8a788266cf8884798ea6bf37b1b10.
Strike Gandcrab_a01269b3	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is a01269b36a5f153ef7c210001e2b071a.
Strike Gandcrab_a1458bf8	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is a1458bf8e676667471b8ebddc42123ab.
Strike Gandcrab_a2ea3a19	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is a2ea3a1987942abe4d79b75d8676d2ad.
Strike Gandcrab_c78096f0	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is c78096f041d994cc2e007a1a0c09a357.
Strike Gandcrab_dd6e6968	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is dd6e6968b41bfe67b1eb6ca06009e029.

<b>Name</b>	<b>Description</b>
Strike Gandcrab_e34a5f17	This strike sends a malware sample known as Gandcrab. GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is e34a5f177d5bb5b8012024708d3f0217.
Strike Gandcrab_e45f0c5d	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is e45f0c5d59ce9f66ecbf7f1207e010fc.
Strike Gandcrab_e7a61e47	This strike sends a polymorphic malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Gandcrab sample is e7a61e4706cc30fd9fce858d4461a7fb.
Strike Gandcrab_eb5f7771	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is eb5f77715eb2a50f1aa03074f3ad388.
Strike Gandcrab_fc157cd5	This strike sends a malware sample known as Gandcrab. GandCrab is ransomware that encrypts documents, photos, databases and other important files typically using the file extension ".GDCB," ".CRAB" or ".KRAB." GandCrab is spread through both traditional spam campaigns, as well as multiple exploit kits, including Rig and GrandSoft. The MD5 hash of this Gandcrab sample is fc157cd5d8a9c32ecaec8a273b064296.
Strike GayFemBoy_03ac6a68	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 03ac6a687be22b30ec48656235fef107.
Strike GayFemBoy_07025e99	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 07025e9990963038249ff2b771ee5d5c.

<b>Name</b>	<b>Description</b>
Strike GayFemBoy_0b6e8d5d	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 0b6e8d5d68dda316da6125d8f6b6ced3.
Strike GayFemBoy_0e17f987	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 0e17f987efa46626eb5d22d6516b3718.
Strike GayFemBoy_100d33b8	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 100d33b8167c0c7d842f0cd93f01648b.
Strike GayFemBoy_12b4f549	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is 12b4f549ae5e131f01b0b1181b06c71e.

It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is a166c743a0141ee18fa912768b767410.

<b>Name</b>	<b>Description</b>
Strike GayFemBoy_a23acaf1	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is a23acaf15e11a623827b44e30ef8c56d.
Strike GayFemBoy_aedae14b	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is aedae14b13971c2f9cf8963c2e6e6667.
Strike GayFemBoy_b1c2b561	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is b1c2b561dd2eae64d89988438bde2639.
Strike GayFemBoy_b9953c35	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is b9953c35f94b231a5e05f818c978c6e2.
Strike GayFemBoy_bd9aecbf	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is bd9aecbfbe099ec9c62873f794b410c5.
Strike GayFemBoy_caee37ae	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is caee37aec95686de5a033c6334e51799.

<b>Name</b>	<b>Description</b>
Strike GayFemBoy_d7df605f	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is d7df605f7ca64352f40293edc59b57f2.
Strike GayFemBoy_da734b14	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is da734b14aac135abce426ab603b6fb6.
Strike GayFemBoy_f92e579f	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is f92e579f058de6f19d5c40dff1aeb3b2.
Strike GayFemBoy_ff296fc2	This strike sends a malware sample known as GayFemBoy. GayFemBoy is a malware of the Mirai botnet family that targets IoT devices, particularly DVRs/NVRs. It infects devices by exploiting known vulnerabilities or using default credentials. Once executed, the malware converts the infected devices into bots that can be used for DDoS attacks or to spread the malware further. Its key capabilities include launching DDoS attacks, self-replication, and the ability to execute arbitrary commands. The MD5 hash of this GayFemBoy sample is ff296fc2d3fc35edcbbeda8aefce75d7.
Strike Gh0stRAT_0f6550a7	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 0f6550a771aef1df84f85e95ff7adb9b.
Strike Gh0stRAT_10733ef1	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 10733ef18028d94596776413babaa9920.
Strike Gh0stRAT_16b909ea	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 16b909ea39f0a1f22a176bf3418ab148.

<b>Name</b>	<b>Description</b>
Strike Gh0stRAT_16c59693	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 16c596936a8c80d6d8810257527f377d.
Strike Gh0stRAT_2b65b00a	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 2b65b00a17cf1a52a6bd1514436681fd.
Strike Gh0stRAT_2be3fc0f	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 2be3fc0fc545426dffbb18de235b9418f.
Strike Gh0stRAT_2c10444b	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 2c10444bbe4c56ef89a26335ae4b74bb.
Strike Gh0stRAT_31a7ba62	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 31a7ba6276ad876d12d537c8f4076d14.
Strike Gh0stRAT_34a648b5	This strike sends a polymorphic malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The binary has random bytes appended at the end of the file. The MD5 hash of this Gh0stRAT sample is 34a648b57683dd4d48a4123aee6542be.
Strike Gh0stRAT_38db1ea3	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 38db1ea30d13a611098c91721bd7daeb.
Strike Gh0stRAT_3d895086	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 3d89508646d71122137fc8576191f1dc.

<b>Name</b>	<b>Description</b>
Strike Gh0stRAT_46fda509	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 46fda5099af718be6fec6710916decb8.
Strike Gh0stRAT_4793b3b8	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 4793b3b82cd0ad256572aff6109f78f5.
Strike Gh0stRAT_52729f8b	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 52729f8b7185d792be872d0821a251a0.
Strike Gh0stRAT_5544f188	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 5544f188c207c2b04e07f9f74f18874b.
Strike Gh0stRAT_572f5ee8	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 572f5ee8ebf9b86c48906dbbb928a78a.
Strike Gh0stRAT_58db1853	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 58db185381561f59c85b0f5eccb428af.
Strike Gh0stRAT_596fcbea	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 596fcbea1a5f3fa86bcf5039881aa576.
Strike Gh0stRAT_5b99f7d1	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 5b99f7d15824fc12df2c4400fe57a492.
Strike Gh0stRAT_6524e285	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is 6524e285d22bb93b6cf2f210c6b9eb7b.

Strike Gh0stRAT_f2c25eab	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is f2c25eab5b6be1a11948729709af7da6.
Strike Gh0stRAT_f7031eeb	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is f7031eeb4c7a87b72cd6432524e46849.
Strike Gh0stRAT_f748ba45	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is f748ba45b2c32e82ab5c3df7d649e7d0.
Strike Gh0stRAT_f9c41e77	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is f9c41e775ffc495c2afaf795acc3d4eb.
Strike Gh0stRAT_fb38fdbf	This strike sends a malware sample known as Gh0stRAT. Gh0stRAT is a remote access Trojan that provides control over an infected system. Some of its known functions include the ability to record keystrokes, record screenshots and download additional malicious payloads. The MD5 hash of this Gh0stRAT sample is fb38fdbf6527cfa784a8f9d6dde56a3f.
Strike GhostCall_0af11f61	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 0af11f610da1f691e43173d44643283f.
Strike GhostCall_12439688	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 1243968876262c3ad4250e1371447b23.

<b>Name</b>	<b>Description</b>
Strike GhostCall_5ad40a5f	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 5ad40a5fd18a1b57b69c44bc2963dc6b.
Strike GhostCall_6348b49f	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 6348b49f3499d760797247b94385fda3.
Strike GhostCall_76ace3a6	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 76ace3a6892c25512b17ed42ac2ebd05.
Strike GhostCall_931cec3c	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 931cec3c80c78d233e3602a042a2e71b.
Strike GhostCall_9551b4af	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 9551b4af789b2db563f9452eaf46b6aa.
Strike GhostCall_963f473f	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is 963f473f1734d8b3fbb8c9a227c06d07.

<b>Name</b>	<b>Description</b>
Strike GhostCall_c42c7a2e	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is c42c7a2ea1c2f00dddb0cc4c8fb5bcf.
Strike GhostCall_c446682f	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is c446682f33641cff21083ac2ce477dbe.
Strike GhostCall_d8529855	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is d8529855fab4b4aa6c2b34449cb3b9fb.
Strike GhostCall_e33f942c	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is e33f942cf1479ca8530a916868bad954.
Strike GhostCall_e8680d17	This strike sends a malware sample known as GhostCall. GhostCall is a malware that is used for cyber espionage activities. It is delivered via spear-phishing emails containing malicious HWP (Hangul Word Processor) documents. Upon opening the document, a malicious payload is dropped and executed which then communicates with a command and control server. The malware's key capabilities include stealing information, maintaining persistence, and bypassing antivirus detection. The MD5 hash of this GhostCall sample is e8680d17fba6425e4a9bb552fb8db2b1.
Strike GhostLocker_00c69252	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is 00c69252bc0e896e2a8b0a9a3d68e41e.

Name	Description
Strike GhostLocker_4119af0c	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is 4119af0c5a12d6153e19514b4be993c4.
Strike GhostLocker_81a13602	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is 81a136029d29d26920c0287faf778776.
Strike GhostLocker_8506b32e	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is 8506b32ea38dc3a844e72051750a75d9.
Strike GhostLocker_9c66d8fd	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is 9c66d8fde4e6d395558182156e6fe298.
Strike GhostLocker_bdc119ef	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is bdc119efae38ea528c10adbd4c9000e4.

<b>Name</b>	<b>Description</b>
Strike GhostLocker_bea3d03f	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is bea3d03f686c73622f08b1f0f8ec5b43.
Strike GhostLocker_cd906ad0	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is cd906ad0553a176d8737b4b85109687c.
Strike GhostLocker_dfb5e296	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is dfb5e2963e9bc48c904f4ac5978fe9ea.
Strike GhostLocker_dfbaa667	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is dfbaa667c07fdd5ad2543ce98d097027.
Strike GhostLocker_e6ec894f	This strike sends a malware sample known as GhostLocker. GhostLocker is a Ransomware-as-a-Service encryptor introduced by a hacktivist group GhostSec. It targets telecommunications companies, surveillance systems, and IoT devices, marketing itself as an enterprise-grade locking software prioritizing safety and effectiveness. Key features include military-grade encryption, undetectability through a polymorphic stub, protection against reverse engineering, self-deletion, service termination, automatic privilege escalation, persistence, a watchdog process, and delayed encryption. The MD5 hash of this GhostLocker sample is e6ec894f69899d14e3e8581939fe0685.

<b>Name</b>	<b>Description</b>
Strike Gigabud RAT_b2429371	This strike sends a malware sample known as Gigabud RAT. Gigabud is a Remote Access Trojan Android malware that has been detected in the wild masquerading as government agencies, shopping apps, and banking applications from Thailand, the Philippines and Peru. The malware has many functions like the ability to receive commands from C2 servers, screen recording, and stealing banking credentials. The MD5 hash of this Gigabud RAT sample is b2429371b530d634b2b86c331515904f.
Strike Gigabud RAT_ca6aa6c5	This strike sends a malware sample known as Gigabud RAT. Gigabud is a Remote Access Trojan Android malware that has been detected in the wild masquerading as government agencies, shopping apps, and banking applications from Thailand, the Philippines and Peru. The malware has many functions like the ability to receive commands from C2 servers, screen recording, and stealing banking credentials. The MD5 hash of this Gigabud RAT sample is ca6aa6c5a7910281a899695e61423079.
Strike GoBear_0db6426b	This strike sends a polymorphic malware sample known as GoBear. GoBear is a Go based backdoor developed by the North Korean group Springtail. The binary has random bytes appended at the end of the file. The MD5 hash of this GoBear sample is 0db6426b2861a8f76bf95616eee9dd55.
Strike GoBear_418e4122	This strike sends a polymorphic malware sample known as GoBear. GoBear is a Go based backdoor developed by the North Korean group Springtail. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this GoBear sample is 418e4122cde54977c4851de04d10a9dc.
Strike GoBear_4a78dc18	This strike sends a polymorphic malware sample known as GoBear. GoBear is a Go based backdoor developed by the North Korean group Springtail. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this GoBear sample is 4a78dc18285aec436b80f07660563259.
Strike GoBear_54392569	This strike sends a polymorphic malware sample known as GoBear. GoBear is a Go based backdoor developed by the North Korean group Springtail. The binary has the checksum removed in the PE file format. The MD5 hash of this GoBear sample is 543925691e7d8d18bb10ef0e888afde7.
Strike GoBear_b74efd84	This strike sends a malware sample known as GoBear. GoBear is a Go based backdoor developed by the North Korean group Springtail. The MD5 hash of this GoBear sample is b74efd8470206a20175d723c14c2e872.
Strike GoBear_f423d4cc	This strike sends a polymorphic malware sample known as GoBear. GoBear is a Go based backdoor developed by the North Korean group Springtail. The binary has the signature removed in the PE file format. The MD5 hash of this GoBear sample is f423d4cc9d241347056ad62e48a3a25c.

<b>Name</b>	<b>Description</b>
Strike GoBruteforcer IRC_207d8d84	This strike sends a malware sample known as GoBruteforcer IRC. GoBruteforcer is malware written in Golang that targets web servers that run the phpMyAdmin, MySQL, FTP and Postgres services. This malware has support for x86,x64, and ARM processor architectures. Once the malware identifies a target it attempts to brute force one of the services listed above. After successfully doing so, it deploys an IRC bot as a method of communicating back to the attacker. The malware also can make attempts to communicate with the command and control server via a PHP web shell. These files are the IRC bot associated with GoBruteforcer. The MD5 hash of this GoBruteforcer IRC sample is 207d8d8496f174396849c8514ce28bee.
Strike GoBruteforcer Webshell_45172413	This strike sends a malware sample known as GoBruteforcer Webshell. GoBruteforcer is malware written in Golang that targets web servers that run the phpMyAdmin, MySQL, FTP and Postgres services. This malware has support for x86,x64, and ARM processor architectures. Once the malware identifies a target it attempts to brute force one of the services listed above. After successfully doing so, it deploys an IRC bot as a method of communicating back to the attacker. The malware also can make attempts to communicate with the command and control server via a PHP web shell. These files are Web shells associated with GoBruteforcer. The MD5 hash of this GoBruteforcer Webshell sample is 45172413e29114dc3820d7e5e2b08b4b.
Strike GoBruteforcer Webshell_c271f586	This strike sends a malware sample known as GoBruteforcer Webshell. GoBruteforcer is malware written in Golang that targets web servers that run the phpMyAdmin, MySQL, FTP and Postgres services. This malware has support for x86,x64, and ARM processor architectures. Once the malware identifies a target it attempts to brute force one of the services listed above. After successfully doing so, it deploys an IRC bot as a method of communicating back to the attacker. The malware also can make attempts to communicate with the command and control server via a PHP web shell. These files are Web shells associated with GoBruteforcer. The MD5 hash of this GoBruteforcer Webshell sample is c271f586d574e6f2ad87e9339835b172.
Strike GoBruteforcer_8f56aeb3	This strike sends a malware sample known as GoBruteforcer. GoBruteforcer is malware written in Golang that targets web servers that run the phpMyAdmin, MySQL, FTP and Postgres services. This malware has support for x86,x64, and ARM processor architectures. Once the malware identifies a target it attempts to brute force one of the services listed above. After successfully doing so, it deploys an IRC bot as a method of communicating back to the attacker. The malware also can make attempts to communicate with the command and control server via a PHP web shell. This file is the GoBruteforcer malware. The MD5 hash of this GoBruteforcer sample is 8f56aeb3d516e6deb858a73da66e1071.
Strike GoBruteforcer_b6134c83	This strike sends a malware sample known as GoBruteforcer. GoBruteforcer is malware written in Golang that targets web servers that run the phpMyAdmin, MySQL, FTP and Postgres services. This malware has support for x86,x64, and ARM processor architectures. Once the malware identifies a target it attempts to brute force one of the services listed above. After successfully doing so, it deploys an IRC bot as a method of communicating back to the attacker. The malware also can make attempts to communicate with the command and control server via a PHP web shell. This file is the GoBruteforcer malware. The MD5 hash of this GoBruteforcer sample is b6134c83fbb3ef6fdff045463038969a.

<b>Name</b>	<b>Description</b>
Strike GoBruteforcer_ffeb1d82	This strike sends a malware sample known as GoBruteforcer. GoBruteforcer is malware written in Golang that targets web servers that run the phpMyAdmin, MySQL, FTP and Postgres services. This malware has support for x86,x64, and ARM processor architectures. Once the malware identifies a target it attempts to brute force one of the services listed above. After successfully doing so, it deploys an IRC bot as a method of communicating back to the attacker. The malware also can make attempts to communicate with the command and control server via a PHP web shell. This file is the GoBruteforcer malware. The MD5 hash of this GoBruteforcer sample is ffeb1d82987d745daf3c9e59f7ce7d37.
Strike GoatRAT_ba5833b4	This strike sends a malware sample known as GoatRAT. GoatRAT is an Android banking trojan. This malware tool attempts to communicate with a C2 server to obtain a PIX Key to perform fraudulent money transactions. This is carried out by employing the ATS or Automated Transfer System technique where a user logs into a banking app and the malware controls the transfers. The MD5 hash of this GoatRAT sample is ba5833b49e2c6501f5bbce90b7948a85.
Strike Godfather_3910e0f2	This strike sends an Android malware sample known as Godfather. It is a trojan which affected 400 banking and crypto applications. It is a successor to the Anubis malware which performs its C2 communication over telegram and does malicious activities like screen recording, exfiltrates push notifications for bypassing 2FA, forwards calls etc. The included sample poses as the Google Play Protect app. The MD5 hash of this Godfather sample is 3910e0f2fa87ef1ac40098c98709886d.
Strike Godfather_7e061e87	This strike sends a malware sample known as Godfather. This strike sends an Android malware sample known as Godfather. It is a trojan which affected 400 banking and crypto applications. It is a successor to the Anubis malware which performs its C2 communication over telegram and does malicious activities like screen recording, exfiltrates push notifications for bypassing 2FA, forwards calls etc. The included sample poses as the Google Play Protect app. The MD5 hash of this Godfather sample is 7e061e87f9a4c27bfb69980980270720.
Strike Godfather_87cc15bb	This strike sends an Android malware sample known as Godfather. It is a trojan which affected 400 banking and crypto applications. It is a successor to the Anubis malware which performs its C2 communication over telegram and does malicious activities like screen recording, exfiltrates push notifications for bypassing 2FA, forwards calls etc. The included sample poses as the Google Play Protect app. The MD5 hash of this Godfather sample is 87cc15bb3d8481c3b9f635a24cdfecee.
Strike Grayling_092479f5	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is 092479f5e1a584e89b8e03ccace849bd.

<b>Name</b>	<b>Description</b>
Strike Grayling_1ba885f6	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is 1ba885f6c185b2ec822d831bcc77949.
Strike Grayling_24137ac3	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is 24137ac3dcad6a12abd58611a5d0c8b9.
Strike Grayling_3c73150f	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is 3c73150fbc80de0019e614c30c7206af.
Strike Grayling_469c57f7	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is 469c57f7448e3884b4f11f652c45c38f.
Strike Grayling_606d786a	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is 606d786a265ae7102255027b044432cf.
Strike Grayling_a49ee90e	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is a49ee90ee45bcb717b1e65facf8f8ce3.
Strike Grayling_a9833509	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is a983350925f47c7e50d2ddbe0fec695f.
Strike Grayling_b6a63b62	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is b6a63b6250dcebdc112729cc2311a80.

<b>Name</b>	<b>Description</b>
Strike Grayling_c720aff8	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is c720aff8f1c5a34fb4f0c61ffaa47225.
Strike Grayling_c93d2c2d	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is c93d2c2d8d9b51a6c1b778c7ddd40455.
Strike Grayling_f8a6759e	This strike sends a malware sample known as Grayling. This sample belongs to a campaign called Grayling. It uses public infrastructure for initial access, deploying shells, and involves a DLL sideloading attack through API SbieDll_Hook and other loading tools. On gaining access attackers escalate privileges, scan networks, and employ downloaders. The MD5 hash of this Grayling sample is f8a6759eebaea38f309f4560cbe52211.
Strike Greenbean_7c8ae6df	This strike sends a polymorphic malware sample known as Greenbean. Arid Viper is an espionage-driven group that delivers attacks targeting Middle Eastern Android users through social engineering techniques. Their primary tool is SpyC23, a family of Android malware disguised as legitimate applications. It steals sensitive information from the device, disables security notifications, and deploys additional malware. 'com.missdong' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 7c8ae6dfe6c41bc4f53feff31d5485b2.
Strike Greenbean_affdbcacf	This strike sends a polymorphic malware sample known as Greenbean. Arid Viper is an espionage-driven group that delivers attacks targeting Middle Eastern Android users through social engineering techniques. Their primary tool is SpyC23, a family of Android malware disguised as legitimate applications. It steals sensitive information from the device, disables security notifications, and deploys additional malware. 'com.missdong' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is affdbcacf76a2c6ae436a0ac29eda3e19.
Strike Greenbean_bf22b7f3	This strike sends a malware sample known as Greenbean. Arid Viper is an espionage-driven group that delivers attacks targeting Middle Eastern Android users through social engineering techniques. Their primary tool is SpyC23, a family of Android malware disguised as legitimate applications. It steals sensitive information from the device, disables security notifications, and deploys additional malware. 'com.missdong' is the package name of the malware sample. The MD5 hash of this malware sample is bf22b7f3a2136314b330f66b82c46123.

<b>Name</b>	<b>Description</b>
Strike Guerrilla_a03f9011	This strike sends a malware sample known as Guerrilla. This strike sends an Android malware sample known as Guerrilla. It is attributed to the threat actors in Lemon Group. The malware has a plugin based architecture which includes a SMS plugin capable of intercepting messages, proxy plugin, a silent plugin for silent app installations. 'zfi.kkvwej.cby.hpyz' is the package name of the malware sample. The MD5 hash of this Guerrilla sample is a03f901158375ca3e5062431ba2ca73f.
Strike HAFNIUM Webshell_1a7a85b0	This strike sends a malware sample known as HAFNIUM Webshell. This HAFNIUM Webshell malware is one of many that has been used in conjunction with Microsoft Exchange Server 0day attacks against a large number of entities primarily based in the United States. After initial infection these web shells are deployed, allowing attackers to steal data and perform further malicious functionality like command execution, file read/write capabilities and tunneling. The Webshell malware has been documented residing in one of several installation paths below. C:\inetpub\wwwroot\aspnet_client\ C:\inetpub\wwwroot\aspnet_client\system_web\ %PROGRAMFILES%\Microsoft\Exchange Server\V15\FrontEnd\HttpProxy\owa\auth\ C:\Exchange\FrontEnd\HttpProxy\owa\auth\ The MD5 hash of this HAFNIUM Webshell sample is 1a7a85b0390b308b1801679e11567eac.
Strike HAFNIUM Webshell_4b3039cf	This strike sends a malware sample known as HAFNIUM Webshell. This HAFNIUM Webshell malware is one of many that has been used in conjunction with Microsoft Exchange Server 0day attacks against a large number of entities primarily based in the United States. After initial infection these web shells are deployed, allowing attackers to steal data and perform further malicious functionality like command execution, file read/write capabilities and tunneling. The Webshell malware has been documented residing in one of several installation paths below. C:\inetpub\wwwroot\aspnet_client\ C:\inetpub\wwwroot\aspnet_client\system_web\ %PROGRAMFILES%\Microsoft\Exchange Server\V15\FrontEnd\HttpProxy\owa\auth\ C:\Exchange\FrontEnd\HttpProxy\owa\auth\ The MD5 hash of this HAFNIUM Webshell sample is 4b3039cf227c611c45d2242d1228a121.
Strike HAFNIUM Webshell_4ef04cba	This strike sends a malware sample known as HAFNIUM Webshell. This HAFNIUM Webshell malware is one of many that has been used in conjunction with Microsoft Exchange Server 0day attacks against a large number of entities primarily based in the United States. After initial infection these web shells are deployed, allowing attackers to steal data and perform further malicious functionality like command execution, file read/write capabilities and tunneling. The Webshell malware has been documented residing in one of several installation paths below. Strike HZ_6d478c7f	<p>This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is 6d478c7f94d95981eb4b6508844050a6.</p>

<b>Name</b>	<b>Description</b>
Strike HZ_7005c9c6	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is 7005c9c6e2502992017f1ffc8ef8a9b9.
Strike HZ_7355e079	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is 7355e0790c111a59af377babedee9018.
Strike HZ_7a66cd84	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is 7a66cd84e2d007664a66679e86832202.
Strike HZ_7ed3fc83	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is 7ed3fc831922733d70fb08da7a244224.
Strike HZ_9cdb61a7	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is 9cdb61a758afd9a893add4cef5608914.
Strike HZ_da07b060	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is da07b0608195a2d5481ad6de3cc6f195.
Strike HZ_dd71b279	This strike sends a malware sample known as HZ. HZ is Remote Access Trojan backdoor. This is a macOS version of HZ that was has been associated with popular messaging apps like DingTalk and WeChat. The malware collects the victim information and communicates with a C2 server to execute additional commands. The MD5 hash of this HZ sample is dd71b279a0bf618bbe9bb5d934ce9caa.
Strike Hades_9fa1ba3e	This strike sends a malware sample known as Hades. Hades is a ransomware created by the cyber-criminal group INDRIK SPIDER, also known as Evil Corp. It shares most of its functionality with WastedLocker and is thus considered a derivative of it. The MD5 hash of this Hades sample is 9fa1ba3e7d6e32f240c790753cdaf8e.

<b>Name</b>	<b>Description</b>
Strike Haron_04ef9ed3	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is 04ef9ed3902dadccabb678c9dad53f19.
Strike Haron_27757047	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is 277570474740f06232e009b5ff15d47a.
Strike Haron_6da3c779	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is 6da3c7796bca2f47f11e8711a945cf1d.
Strike Haron_731797d3	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is 731797d30d8ff6eaf901e788bd4e6048.
Strike Haron_7806efea	This strike sends a polymorphic malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Haron sample is 7806efea649a3b312be91e609541359b.
Strike Haron_92c2e2f6	This strike sends a polymorphic malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Haron sample is 92c2e2f66b9717304aa67c9114b959c2.
Strike Haron_af79a121	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is af79a121a5c315f5a7b8a2180ccbea0f.
Strike Haron_dedad693	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is dedad693898bba0e4964e6c9a749d380.

<b>Name</b>	<b>Description</b>
Strike Haron_e8f8e4eb	This strike sends a malware sample known as Haron. Haron is a ransomware that is being considered a copy or derivative of the Avaddon and Thanos ransomware. It uses the Thanos framework to infect victims, which was made open source, and the Avaddon UI which was also leaked. The MD5 hash of this Haron sample is e8f8e4eb0d2c03f0b12fb1cf09932bbd.
Strike HawkEye_2a759d9c	This strike sends a malware sample known as HawkEye. HawkEye is an information stealing malware that specifically targets usernames and passwords stored by web browsers and mail clients on an infected machine. It is commonly spread via email and can also propagate through removable media. The MD5 hash of this HawkEye sample is 2a759d9cc498a190f3f8c71f57e65644.
Strike HawkEye_3ba7171c	This strike sends a malware sample known as HawkEye. HawkEye is an information stealing malware that specifically targets usernames and passwords stored by web browsers and mail clients on an infected machine. It is commonly spread via email and can also propagate through removable media. The MD5 hash of this HawkEye sample is 3ba7171c8836de935a74799291ebca46.
Strike HawkEye_3eb89430	This strike sends a malware sample known as HawkEye. HawkEye is an information stealing malware that specifically targets usernames and passwords stored by web browsers and mail clients on an infected machine. It is commonly spread via email and can also propagate through removable media. The MD5 hash of this HawkEye sample is 3eb89430ad1c97dc03a85175299a5a37.
Strike HawkEye_600fb168	This strike sends a malware sample known as HawkEye. HawkEye is an information stealing malware that specifically targets usernames and passwords stored by web browsers and mail clients on an infected machine. It is commonly spread via email and can also propagate through removable media. The MD5 hash of this HawkEye sample is 600fb1681d639f913b70884da6996d5a.
Strike HawkEye_65e73f93	This strike sends a malware sample known as HawkEye. HawkEye is an information stealing malware that specifically targets usernames and passwords stored by web browsers and mail clients on an infected machine. Like WhisperGate this wiper malware will target the Master Boot Record and attempt to destroy it. It also includes a component that will enumerate the system partitions and wipe all files on the targeted system. The binary has random bytes appended at the end of the file. The MD5 hash of this HermeticWiper sample is e19137f2f707150493887c1504c3a794.

<b>Name</b>	<b>Description</b>
Strike HermeticWiper_ece4f943	This strike sends a polymorphic malware sample known as HermeticWiper. In February 2022 a new wave of wiper attacks against the country of Ukraine was detected. The malware HermeticWiper exhibits similar functionality to the previous wiper malware WhisperGate used in cyber attacks against Ukraine. Like WhisperGate this wiper malware will target the Master Boot Record and attempt to destroy it. It also includes a component that will enumerate the system partitions and wipe all files on the targeted system. The binary has the timestamp field updated in the PE file header. The MD5 hash of this HermeticWiper sample is ece4f943b6d5d11ff42b071fe775922e.
Strike HermeticWiper_fdfbd04e	This strike sends a polymorphic malware sample known as HermeticWiper. In February 2022 a new wave of wiper attacks against the country of Ukraine was detected. The malware HermeticWiper exhibits similar functionality to the previous wiper malware WhisperGate used in cyber attacks against Ukraine. Like WhisperGate this wiper malware will target the Master Boot Record and attempt to destroy it. Strike Hive_700ab60c	This strike sends a malware sample known as Hive. Hive is a popular Ransomware as a Service malware written in Go and Rust. This malware has been used in attacks in both the healthcare and software industries. The ransomware encrypts all data on the system and informs the victim that their personal data will be exfiltrated and disclosed unless the ransom is paid. The MD5 hash of this Hive sample is 700ab60cd8ea41c959394479d0baf5e。
Strike Hive_d7fb1939	This strike sends a malware sample known as Hive. Hive is a popular Ransomware as a Service malware written in Go and Rust. This malware has been used in attacks in both the healthcare and software industries. The ransomware encrypts all data on the system and informs the victim that their personal data will be exfiltrated and disclosed unless the ransom is paid. The MD5 hash of this Hive sample is d7fb1939cf5bda2d2c6b792324554dfc。

<b>Name</b>	<b>Description</b>
Strike HomeLand Justice Encryptor_11e534e8	This strike sends a polymorphic malware sample known as HomeLand Justice Encryptor. Iranian state cyber actors calling themselves "HomeLand Justice" launched a cyber attack against the Government of Albania. During the attack the attackers conducted lateral movements, network reconnaissance, and credential harvesting against the Albanian Government. This attack also included a ransomware-style file encryptor and disk wiping malware. This sample is the GoXML.exe ransomware encryptor. The binary has random bytes appended at the end of the file. The MD5 hash of this HomeLand Justice Encryptor sample is 11e534e8f9f6d2068a97d07e6b2e95d4.
Strike HomeLand Justice Encryptor_2e3f4d0c	This strike sends a polymorphic malware sample known as HomeLand Justice Encryptor. Iranian state cyber actors calling themselves "HomeLand Justice" launched a cyber attack against the Government of Albania. During the attack the attackers conducted lateral movements, network reconnaissance, and credential harvesting against the Albanian Government. This attack also included a ransomware-style file encryptor and disk wiping malware. This sample is the GoXML.exe ransomware encryptor. The binary has the checksum removed in the PE file format. The MD5 hash of this HomeLand Justice Encryptor sample is 2e3f4d0c18c040e8ff0b8d8da1cbcc84.
Strike HomeLand Justice Encryptor_2fc18ad9	This strike sends a polymorphic malware sample known as HomeLand Justice Encryptor. Iranian state cyber actors calling themselves "HomeLand Justice" launched a cyber attack against the Government of Albania. During the attack the attackers conducted lateral movements, network reconnaissance, and credential harvesting against the Albanian Government. This attack also included a ransomware-style file encryptor and disk wiping malware. This sample is the GoXML.exe ransomware encryptor. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this HomeLand Justice Encryptor sample is 2fc18ad9d19c40895dfa3aa743188082.
Strike HomeLand Justice Encryptor_369ddb9e	This strike sends a polymorphic malware sample known as HomeLand Justice Encryptor. Iranian state cyber actors calling themselves "HomeLand Justice" launched a cyber attack against the Government of Albania. During the attack the attackers conducted lateral movements, network reconnaissance, and credential harvesting against the Albanian Government. This attack also included a ransomware-style file encryptor and disk wiping malware. This sample is the GoXML.exe ransomware encryptor. The binary has the timestamp field updated in the PE file header. The MD5 hash of this HomeLand Justice Encryptor sample is 369ddb9e0d94793f0f70dfa3d8d2079f.
Strike HomeLand Justice Encryptor_64035692	This strike sends a polymorphic malware sample known as HomeLand Justice Encryptor. Iranian state cyber actors calling themselves "HomeLand Justice" launched a cyber attack against the Government of Albania. During the attack the attackers conducted lateral movements, network reconnaissance, and credential harvesting against the Albanian Government. This attack also included a ransomware-style file encryptor and disk wiping malware. This sample is the GoXML.exe ransomware encryptor. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this HomeLand Justice Encryptor sample is 64035692b7c55caf9fd4d2535a5face3.

Strike HorusAgent_00c05d72	This strike sends a malware sample known as Horus Agent. This strike sends a malware sample known as Horus Agent. Horus Agent is part of a cyberespionage campaign conducted by the Stealth Falcon threat group. It is delivered through a malicious .url file disguised as a PDF that exploits CVE 2025 33053, a zero day vulnerability in Windows WebDAV, to execute payloads via iediagcmd.exe. The malware chain includes Horus Loader, which uses evasion techniques like anti-VM checks and DLL mapping, and deploys Horus Agent, a C++ implant based on the Mythic C2 framework. The agent supports remote access, shellcode injection, file operations, and includes modules for credential theft and keylogging. The MD5 hash of this Horus Agent sample is 00c05d72920d62077b7c670919214339.
Strike HorusAgent_04409d6f	This strike sends a malware sample known as Horus Agent. This strike sends a malware sample known as Horus Agent. Horus Agent is part of a cyberespionage campaign conducted by the Stealth Falcon threat group. It is delivered through a malicious .url file disguised as a PDF that exploits CVE 2025 33053, a zero day vulnerability in Windows WebDAV, to execute payloads via iediagcmd.exe. The malware chain includes Horus Loader, which uses evasion techniques like anti-VM checks and DLL mapping, and deploys Horus Agent, a C++ implant based on the Mythic C2 framework. The agent supports remote access, shellcode injection, file operations, and includes modules for credential theft and keylogging. The MD5 hash of this Horus Agent sample is 04409d6fb02c66e4a928c5c7bf1cf663.
Strike HorusAgent_316f9713	This strike sends a malware sample known as Horus Agent. This strike sends a malware sample known as Horus Agent. The malware initiates a shell script downloader which proceeds to delete logs, download, and execute various bot clients for Linux architectures and obstruct network connections on multiple ports. It establishes C2 communication between compromised devices and the command sever, enabling the launching of DDoS attacks with specific parameters. The MD5 hash of this IZ1H9 sample is c0e82281a49e836a9ca75f44ca0749b5.
Strike IZ1H9_ca732733	This strike sends a malware sample known as IZ1H9. IZ1H9, is a variant of Mirai, it targets Linux-based networked devices, particularly IoT devices, and transforms them into remotely controlled bots for conducting large-scale network attacks. The malware initiates a shell script downloader which proceeds to delete logs, download, and execute various bot clients for Linux architectures and obstruct network connections on multiple ports. It establishes C2 communication between compromised devices and the command sever, enabling the launching of DDoS attacks with specific parameters. The MD5 hash of this IZ1H9 sample is ca732733cd816e60655c82bce09bc715.
Strike IZ1H9_d3dc81a5	This strike sends a malware sample known as IZ1H9. Strike InfectedSlurs_465e3c3f	<p>This strike sends a malware sample known as InfectedSlurs. InfectedSlurs is a new Mirai-based malware botnet that exploits two zero-day remote code execution vulnerabilities to infect routers and video recorder (NVR) devices. The malware hijacks these devices to form a distributed denial-of-service (DDoS) swarm, likely rented for profit. The malware is associated with the older JenX Mirai variant and poses a significant global threat, utilizing a unique approach of targeting a seldom-used TCP port. It particularly focuses on real-time streaming protocol (RTSP) enabled devices, exploiting a zero-day vulnerability in NVR devices and a second exploit in outlet-based wireless LAN routers designed for hotel and residential applications. The MD5 hash of this InfectedSlurs sample is 465e3c3fb87cd6402b162ae0777fceae.</p>

Strike JanelaRAT_172ca00d	This strike sends a malware sample known as JanelaRAT. JanelaRAT malware has been discovered targeting financial and cryptocurrency data from financial institutions. The malware is a multi staged malware with the original infection being unknown. It begins as a compressed archive that contains a VBS script. Once executed the VBS script drops a batch script and retrieves an additional compressed archive from the attacker. The batch script sets up persistence on the machine. The RAT includes the capability to record mouse and keyboard inputs and record screenshots. One of the key tasks of the malware is to capture the content of the windows title bars to check for relevant titles that may indicate a financial target. JanelaRAT uses a legitimate DLL to side load a malicious dll, and communicates with an attacker controlled C2 server. The MD5 hash of this JanelaRAT sample is 172ca00d32a201f5e917bc4d73f720a1.

Strike KandyKorn_015c5d12	This strike sends a malware sample known as KandyKorn. KandyKorn is a sophisticated multi-stage malware campaign orchestrated by DPRK threat actors, targeting blockchain engineers of a crypto exchange platform. This operation employs Python scripts to initially compromise the Discord app, leading to the delivery of the C++ based backdoor RAT. The campaign utilizes social engineering through Discord, enticing victims with a malicious Python application disguised as a cryptocurrency tool. The malware's modular approach includes SwiftLoader droppers, and its capabilities involve script execution, Mach-O binary deployment, and communication with remote C2 servers for data exfiltration. The MD5 hash of this KandyKorn sample is 015c5d12273dde42fd0a17985ee9a1cd.

KandyKorn is a sophisticated multi-stage malware campaign orchestrated by DPRK threat actors, targeting blockchain engineers of a crypto exchange platform. This operation employs Python scripts to initially compromise the Discord app, leading to the delivery of the C++ based backdoor RAT. The campaign utilizes social engineering through Discord, enticing victims with a malicious Python application disguised as a cryptocurrency tool. The malware's modular approach includes SwiftLoader droppers, and its capabilities involve script execution, Mach-O binary deployment, and communication with remote C2 servers for data exfiltration. The MD5 hash of this KandyKorn sample is 056b1d9ce628efe6128e17cddab3811e.

The MD5 hash of this Kimsuky sample is a8269069133ecf1924db2b5d712f33ad.

<b>Name</b>	<b>Description</b>
Strike Kimsuky_efee226c	This strike sends a malware sample known as Kimsuky. Kimsuky is a malware of the spyware family developed by North Korean groups that targets South Korean think tanks and political entities. It is typically delivered through spear-phishing emails that contain malicious Microsoft Word documents. Once executed, the malware collects information from the infected system and sends it back to the attacker's command-and-control server. The key capabilities of Kimsuky include keystroke logging, capturing screenshots, and stealing documents from the infected system. The MD5 hash of this Kimsuky sample is efee226c8dc22cc3090709202b853970.
Strike Klopatra_26e59fbf	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is 26e59fbfa6bedc8910638c44986cf8f4.
Strike Klopatra_34ced080	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is 34ced080497311f03e7e5e8ef01b0db3.
Strike Klopatra_4ef93b8b	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is 4ef93b8bb360b87958b8e1f70c0438b8.
Strike Klopatra_7d55b181	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is 7d55b1815aae99cab061fbfd1908e87.

<b>Name</b>	<b>Description</b>
Strike Klopatra_7eb52c6f	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is 7eb52c6f4fd646190b2ba518226a4cdd.
Strike Klopatra_7fe5950a	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is 7fe5950ad2772ac64363e952022a49a5.
Strike Klopatra_ac55f4e3	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is ac55f4e37bb097892100ea25f6dae3cf.
Strike Klopatra_b5988fbc	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is b5988fbce2365e62803a613508070780.
Strike Klopatra_ce73486e	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is ce73486ef665a71f882489e68f842a40.

<b>Name</b>	<b>Description</b>
Strike Klopatra_d553a2db	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is d553a2dbd3076c45008ce4009dff8b97.
Strike Klopatra_d606d84e	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is d606d84eff5f24502204ef5a86af0319.
Strike Klopatra_f8e6ce9e	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is f8e6ce9e7d1749c8f7712ff7c5e16b62.
Strike Klopatra_fa1d6028	This strike sends a malware sample known as Klopatra. Klopatra is a new Android banking Trojan that targets users in Turkey and other countries. It is distributed through third-party application stores and phishing SMS messages that trick users into downloading the malware. Once installed, Klopatra displays a fake login screen to capture banking credentials and sends them to a remote server. The key capabilities of this Trojan include screen overlay attacks, data exfiltration, and remote control of the infected device. The MD5 hash of this Klopatra sample is fa1d6028d68b1d117438915edcb178f8.
Strike Knot_0436580f	This strike sends a polymorphic malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The binary has the checksum removed in the PE file format. The MD5 hash of this Knot sample is 0436580f7e118a3062450ffd13288c02.
Strike Knot_302b61cc	This strike sends a polymorphic malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Knot sample is 302b61cc09ad102f5b1c05574d91579b.

<b>Name</b>	<b>Description</b>
Strike Knot_5e9dcfb6	This strike sends a malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The MD5 hash of this Knot sample is 5e9dcfb6141d521b6f2b16ab0dbe237e.
Strike Knot_b26cbc5c	This strike sends a polymorphic malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The binary has random bytes appended at the end of the file. The MD5 hash of this Knot sample is b26cbc5c13740cc38a8514e3db80ba49.
Strike Knot_db44127c	This strike sends a polymorphic malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Knot sample is db44127c7cdff0469fab4474cdaaa452.
Strike Knot_f5254af2	This strike sends a polymorphic malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Knot sample is f5254af2e940448221167d674cc11fc0.
Strike Knot_fe2bf4f2	This strike sends a polymorphic malware sample known as Knot. Knot is a ransomware that downloads key data to "d.jpg" in the %TEMP%. It requests a ransom to be paid in bitcoin and supplies a knodecryptor once paid to decrypt the user's files. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Knot sample is fe2bf4f242f5e4f03eb16a4b48126212.
Strike Konni_8ce075e4	This strike sends a malware sample known as Konni. This sample belongs to Konni, an APT group that takes advantage of a harmful Russian-language Word document to spread malware on the impacted systems. Konni APT group is known for its sophisticated cyber-espionage campaigns aimed at data exfiltration. Konni leverages an advanced toolset embedded in a harmful Word document through batch scripts and DLL files. The payload includes a User Account Control (UAC) bypass and encrypted communication with a C2 server, allowing attackers to run privileged commands. The MD5 hash of this Konni sample is 8ce075e44ae4ac67862a5024d997161d.
Strike Konni_b6a9f393	This strike sends a malware sample known as Konni. This sample belongs to Konni, an APT group that takes advantage of a harmful Russian-language Word document to spread malware on the impacted systems. Konni APT group is known for its sophisticated cyber-espionage campaigns aimed at data exfiltration. Konni leverages an advanced toolset embedded in a harmful Word document through batch scripts and DLL files. The payload includes a User Account Control (UAC) bypass and encrypted communication with a C2 server, allowing attackers to run privileged commands. The MD5 hash of this Konni sample is b6a9f3933f734f7822da5e7b520ed79d.

<b>Name</b>	<b>Description</b>

Strike Korplug Loader_5e21fab6	<p>This strike sends a malware sample known as Korplug Loader. MQsTTang is malware backdoor that has been attributed to the Mustang Panda APT group. This group has focused primarily on political organizations in Europe and Asia. The Mustang Panda group uses phishing emails to distribute the malware and Github to host the payloads. Once executed the malware duplicates itself and begins enabling persistence by creating a registry key. The malware communicates to the C2 server via the MQTT protocol and includes functionality to detect debugging and monitoring tools in order to evade detection. This file is the Korplug malware loader that has been associated with Mustang Panda and MQsTTang. The MD5 hash of this Korplug Loader sample is 5e21fab62fe16cba1f74e103af13a2db.</p>

<b>Name</b>	<b>Description</b>

Strike Kuluoz_838f9a5e	This strike sends a malware sample known as Kuluoz. Kuluoz also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluoz sample is 838f9a5eac96fce37f3ba5de28ba5d81.

<b>Name</b>	<b>Description</b>
Strike Kuluo_86631965	This strike sends a polymorphic malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Kuluo sample is 866319652a22b4be324d298aefda62b7.
Strike Kuluo_8c50454c	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 8c50454c2720cd0b8c50aa7977dbc28a.
Strike Kuluo_8f5c3202	This strike sends a polymorphic malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary has random bytes appended at the end of the file. The MD5 hash of this Kuluo sample is 8f5c320206923f7e06ff383791843518.
Strike Kuluo_93793281	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 937932817fad19389760ab3a9880d0fe.
Strike Kuluo_93af451a	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 93af451a9a9b7ce0b3f227ba2d6ad085.
Strike Kuluo_97765c75	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 97765c75f51e113c6acf427e006d4bb3.
Strike Kuluo_97cb5078	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 97cb5078dd3beed3619d78a1a74cb698.
Strike Kuluo_9849c613	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 9849c613e8add1b4c40dc6e21516809c.
Strike Kuluo_9887fa9e	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is 9887fa9e47fed89b74599c387907b794.
Strike Kuluo_9a15bffa	This strike sends a polymorphic malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary has been packed using upx packer, with the default options. The MD5 hash of this Kuluo sample is 9a15bffa27d1ee27dedfe8502aac198e.

<b>Name</b>	<b>Description</b>
Strike Kuluo_9f102a84	This strike sends a polymorphic malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Kuluo sample is 9f102a84f196533b26202fed7c996a25.
Strike Kuluo_a0113745	This strike sends a polymorphic malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary file has one more imports added in the import table. The MD5 hash of this Kuluo sample is a0113745dc6cf9ac1346da1edb91d07a.
Strike Kuluo_a0318efb	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a0318efb7b883fc4c725bdf72c3ed5f1.
Strike Kuluo_a21740b0	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a21740b03a097f9323dcf55887e372f4.
Strike Kuluo_a250b5c8	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a250b5c892d7c5b73d1d37b5305b1898.
Strike Kuluo_a26c6aca	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a26c6aca229b4012e78497689baac26f.
Strike Kuluo_a2afe5d1	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a2afe5d161efec64eb761c98bd78a778.
Strike Kuluo_a2d400fe	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a2d400fec6cc641a1cbe40e3eda7033.
Strike Kuluo_a6584ff4	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a6584ff407513e6bb84599908b01b78a.
Strike Kuluo_a7d2ae19	This strike sends a malware sample known as Kuluo. Kuluo also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo sample is a7d2ae192489f6494346f91efb1bfe83.

<b>Name</b>	<b>Description</b>
Strike Kuluo_z_a7e29d98	This strike sends a polymorphic malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary file has one more imports added in the import table. The MD5 hash of this Kuluo_z sample is a7e29d98e9bb31285477a9790346f9f4.
Strike Kuluo_z_a8376144	This strike sends a polymorphic malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary has been packed using upx packer, with the default options. The MD5 hash of this Kuluo_z sample is a8376144472b76b3df8c4ab2aa626511.
Strike Kuluo_z_a84de6a0	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is a84de6a0384f75f5e465250a552d8fa0.
Strike Kuluo_z_adf212a0	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is adf212a0e7d0cc067e27bff1d6ecad3b.
Strike Kuluo_z_af04de71	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is af04de71b83c9154f0fa96dee30af38c.
Strike Kuluo_z_b23f52f9	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is b23f52f94d56fca439a4ec7f9de8c496.
Strike Kuluo_z_b3bb969a	This strike sends a polymorphic malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Kuluo_z sample is b3bb969a3fc26077a914f6d2c558cdb5.
Strike Kuluo_z_b48e028e	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is b48e028e2c22b329aa4b3308c95a1963.
Strike Kuluo_z_b65935d5	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is b65935d5de9514b4b1e67bff182f503f.
Strike Kuluo_z_b97fe5e4	This strike sends a malware sample known as Kuluo_z. Kuluo_z also called Asprox is a remote access trojan that has been known to download and execute additional malware like fake antivirus software. The MD5 hash of this Kuluo_z sample is b97fe5e4dda43c145fd578d0553286c6.

Strike LATENTBOT_56ba76cf	This strike sends a malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The MD5 hash of this LATENTBOT sample is 56ba76cf35a1121bf83920003c2af825.

<b>Name</b>	<b>Description</b>
Strike LATENTBOT_5eaf2d54	This strike sends a polymorphic malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The binary has the timestamp field updated in the PE file header. The MD5 hash of this LATENTBOT sample is 5eaf2d547323c5bbb89290ae1cbf9ab5.
Strike LATENTBOT_6ea9d27d	This strike sends a malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The MD5 hash of this LATENTBOT sample is 6ea9d27d23646fc94e05b8c5e921db99.
Strike LATENTBOT_a11362a8	This strike sends a malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The MD5 hash of this LATENTBOT sample is a11362a8e32b5641e90920729d61b3d4.
Strike LATENTBOT_af15076a	This strike sends a malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The MD5 hash of this LATENTBOT sample is af15076a22576f270af0111b93fe6e03.
Strike LATENTBOT_d349806e	This strike sends a malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The MD5 hash of this LATENTBOT sample is d349806ea1f2af0f447b2c9e20cb88f0.
Strike LATENTBOT_fa20c7f3	This strike sends a polymorphic malware sample known as LATENTBOT. LATENTBOT is a malware which may be used to harvest credentials, encrypt and ransom an infected target, or wipe the infected hard drive. It has been found in the wild since 2013. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this LATENTBOT sample is fa20c7f3e1091c12dde319acf4b75b9a.
Strike Letscall_e84d00df	This strike sends a malware sample known as Letscall. Letscall is a Voice over IP Phishing malware. The malware is 3 stages in its attack. The first stage prepares the device by acquiring the necessary permissions and then launches a phishing page. The second stage is then downloaded from a C2 server. In the second stage the device is infected with spyware and enlisted in a P2P VOIP network for communication. The third stage of the malware includes many capabilities such as the ability to redirect outbound calls to the attacker controlled call center for further social engineering. The MD5 hash of this Letscall sample is e84d00df86ab5edfc8c26ae89ca0508.
Strike Liberator_5acdd854	This strike sends a polymorphic malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The binary has the checksum removed in the PE file format. The MD5 hash of this Liberator sample is 5acdd8541c6085cd0dc03670bb4cf157.

<b>Name</b>	<b>Description</b>
Strike Liberator_5c0693ed	This strike sends a malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The MD5 hash of this Liberator sample is 5c0693ed5953c01ccf046b8a9461efa3.
Strike Liberator_62b9e5b4	This strike sends a malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The MD5 hash of this Liberator sample is 62b9e5b4b36511838fc8960202a88d45.
Strike Liberator_876b71d3	This strike sends a malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The MD5 hash of this Liberator sample is 876b71d32631eb0980cf48e839566204.
Strike Liberator_a177262e	This strike sends a polymorphic malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Liberator sample is a177262efae98183e97bd29357c9aad2.
Strike Liberator_cc720105	This strike sends a polymorphic malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The binary has random bytes appended at the end of the file. The MD5 hash of this Liberator sample is cc7201057f28437d8c1d32deb8bcf4b7.
Strike Liberator_d60e2151	This strike sends a polymorphic malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Liberator sample is d60e2151cc438b1c6378d23aedd7f3b1.

<b>Name</b>	<b>Description</b>
Strike Liberator_dd20876b	This strike sends a malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The MD5 hash of this Liberator sample is dd20876bf25544aa55e0c3725103c666.
Strike Liberator_ee1b1be4	This strike sends a polymorphic malware sample known as Liberator. Liberator is malware distributed by the group known as disBalancer as a tool that offers users the ability to perform DDoS attacks against Russian propaganda websites in an effort to help Ukraine. However unknown to users, these files once downloaded infect the system with malware like info-stealers designed to dump credentials and cryptocurrency-related information. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Liberator sample is ee1b1be464867edc5e847b3f219ab85b.
Strike Lightrail_0a739dbd	This strike sends a malware sample known as Lightrail. Lightrail is a tunneler that has been associated with the Minibike and Minibus backdoor malware and the UNC1549 threat actor. It uses the Azure cloud infrastructure to communicate with command and control servers. The MD5 hash of this Lightrail sample is 0a739dbdbcf9a5d8389511732371ecb4.
Strike Lightrail_36e2d9ce	This strike sends a malware sample known as Lightrail. Lightrail is a tunneler that has been associated with the Minibike and Minibus backdoor malware and the UNC1549 threat actor. It uses the Azure cloud infrastructure to communicate with command and control servers. The MD5 hash of this Lightrail sample is 36e2d9ce19ed045a9840313439d6f18d.
Strike Lightrail_a5fdf55c	This strike sends a malware sample known as Lightrail. Lightrail is a tunneler that has been associated with the Minibike and Minibus backdoor malware and the UNC1549 threat actor. It uses the Azure cloud infrastructure to communicate with command and control servers. The MD5 hash of this Lightrail sample is a5fdf55c1c50be471946de937f1e46dd.
Strike Lightrail_aaef98be	This strike sends a malware sample known as Lightrail. Lightrail is a tunneler that has been associated with the Minibike and Minibus backdoor malware and the UNC1549 threat actor. It uses the Azure cloud infrastructure to communicate with command and control servers. The MD5 hash of this Lightrail sample is aaef98be8e58be6b96566268c163b6aa.
Strike Lightrail_c3830b13	This strike sends a malware sample known as Lightrail. Lightrail is a tunneler that has been associated with the Minibike and Minibus backdoor malware and the UNC1549 threat actor. It uses the Azure cloud infrastructure to communicate with command and control servers. The MD5 hash of this Lightrail sample is c3830b1381d95aa6f97a58fd8ff3524e.
Strike Lightrail_c51bc86b	This strike sends a malware sample known as Lightrail. Lightrail is a tunneler that has been associated with the Minibike and Minibus backdoor malware and the UNC1549 threat actor. It uses the Azure cloud infrastructure to communicate with command and control servers. The MD5 hash of this Lightrail sample is c51bc86beb9e16d1c905160e96d9fa29.

<b>Name</b>	<b>Description</b>
Strike Linux.Gomir_e562cf30	This strike sends a malware sample known as Linux.Gomir. Linux.Gomir is a Linux backdoor developed by the North Korean group Springtail. Similar to the Windows GoBear backdoor, it communicates with a C2 server to receive encrypted commands to execute. The MD5 hash of this Linux.Gomir sample is e562cf30d17d47347c7e6ffd249fc190.
Strike Lontail_1176381d	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 1176381da7dea356f3377a59a6f0e799.
Strike Lontail_126bc1c3	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 126bc1c30fba27f8bf67dce4892b1e8c.
Strike Lontail_16217533	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 16217533756678968169932c05280d94.
Strike Lontail_2e803d28	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 2e803d28809be2a0216f25126efde37b.
Strike Lontail_31f2369d	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 31f2369d2e38c78f5b3f2035dba07c08.

<b>Name</b>	<b>Description</b>
Strike Lontail_3dd829fb	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 3dd829fb27353622eff34be1eabb8f18.
Strike Lontail_46804472	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 46804472541ed61cc904cd14be18fe1d.
Strike Lontail_4abcf21b	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 4abcf21b63781a53bbc1aa17bd8d2cbc.
Strike Lontail_4dd6250e	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 4dd6250eb2d368f500949952eb013964.
Strike Lontail_57c916da	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 57c916da83cc634af22bde0ad44d0db3.
Strike Lontail_85427a8a	This strike sends a malware sample known as Lontail. Lontail is a sophisticated passive backdoor installed on Windows servers that enables attackers to execute commands remotely through HTTP requests. It targets high-profile organizations in the Middle East, including government, military, telecommunications, and financial institutions. Lontail includes custom loaders and memory-resident shellcode payloads and leverages undocumented features of the HTTP.sys driver for payload extraction. The MD5 hash of this Lontail sample is 85427a8a47c4162b48d8dfb37440665d.

<b>Name</b>	<b>Description</b>
Strike Lontail_929b12bc	This strike sends a malware sample known as Lontail. Strike LitterDrifter_1536ec56	This strike sends a malware sample known as LitterDrifter. LitterDrifter, associated with Gamaredon, is a USB-propagating worm, written in VBS, that autonomously spreads via USB drives and communicates with a dynamic command-and-control infrastructure. Evolving from a prior Gamaredon USB Powershell worm, LitterDrifter ensures persistent control across diverse global targets. Orchestrated by "trash.dll," it effectively spreads and establishes a resilient command and control channel. The spreader module targets USB removable media, while the C2 module manages communication with the attacker's servers and executes payloads. The MD5 hash of this LitterDrifter sample is 1536ec56d69cc7e9aebb8fb0d3277c4.

<b>Name</b>	<b>Description</b>

Orchestrated by "trash.dll," it effectively spreads and establishes a resilient command and control channel. The spreader module targets USB removable media, while the C2 module manages communication with the attacker's servers and executes payloads. The MD5 hash of this LitterDrifter sample is 88aba3f2d526b0ba3db9bc3dfee7db39.</p>
Strike LitterDrifter_96db6240	<p>This strike sends a malware sample known as LitterDrifter. LitterDrifter, associated with Gamaredon, is a USB-propagating worm, written in VBS, that autonomously spreads via USB drives and communicates with a dynamic command-and-control infrastructure. Evolving from a prior Gamaredon USB Powershell worm, LitterDrifter ensures persistent control across diverse global targets. Orchestrated by "trash.dll," it effectively spreads and establishes a resilient command and control channel. The spreader module targets USB removable media, while the C2 module manages communication with the attacker's servers and executes payloads. The MD5 hash of this LitterDrifter sample is 96db6240acb1a3fca8add7c4f9472aa5.</p>
Strike LitterDrifter_9d9851d6	<p>This strike sends a malware sample known as LitterDrifter. The spreader module targets USB removable media, while the C2 module manages communication with the attacker's servers and executes payloads. The MD5 hash of this LitterDrifter sample is cdae1c55ec154cd6cef4954519564c01.
Strike LockBit Black_7e37f198	This strike sends a malware sample known as LockBit Black. The LockBit Black malware variant performs anti-forensic functions like killing multiple tasks, clearing logs and deleting services. It obtains initial access to the victim's network via SMB brute forcing, and uses PSEXEC to execute files and spread laterally across the network. The MD5 hash of this LockBit Black sample is 7e37f198c71a81af5384c480520ee36e.
Strike LockBit_04436f49	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 04436f490b3491218e3793a568484624.
Strike LockBit_06bd47b8	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 06bd47b8ec7e6277dc6c8842d00f7243.

<b>Name</b>	<b>Description</b>
Strike LockBit_0859a78b	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 0859a78bb06a77e7c6758276eafbefd9.
Strike LockBit_089e3b6a	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 089e3b6a539d4c7099cc5fdf559e01e.
Strike LockBit_0d03306e	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 0d03306ed6dd40407e8ae0fa3ffc181f.
Strike LockBit_0e3501b3	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 0e3501b3b6626c98793588b8eca7122e.
Strike LockBit_0f28c0c3	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 0f28c0c3a2d7206816f15111ae7a3141.
Strike LockBit_11d6a53e	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 11d6a53e5ca41ce15b7f09b1c68dcfb1.
Strike LockBit_12351122	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 123511227718f17b3dec5431d5ae87f3.
Strike LockBit_18aff9c4	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 18aff9c4264f6d7e5b0dec5bf944f276.
Strike LockBit_1dbb4f12	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 1dbb4f122e2ccaf5ef2003a827367c34.
Strike LockBit_1f4f6abf	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 1f4f6abfcfd4c347ba951a04c8d86982.

<b>Name</b>	<b>Description</b>
Strike LockBit_1fbef2a9	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 1fbef2a9007eb0e32fb586e0fca3f0e7.
Strike LockBit_207718c9	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 207718c939673a5f674ce51f402fc06.
Strike LockBit_2599bd20	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 2599bd20a5c84309e1c1a80b0041f685.
Strike LockBit_265d02e0	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 265d02e0a563bbdbdb2883add41ff4bb.
Strike LockBit_28afbe8d	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 28afbe8d30dd2950702275bbb611d4cb.
Strike LockBit_306b16a3	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 306b16a367f9d534a976e3ecb6ed5549.
Strike LockBit_37ec80fb	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 37ec80fb2302d5893cb6984cb1a43e2.
Strike LockBit_3826fca4	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 3826fca41ae4c2d799bb6948e2fed18f.
Strike LockBit_3fa216f0	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 3fa216f058ffdlda8f15ba47d5ff07e1.
Strike LockBit_43b1b8cf	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 43b1b8cf880ce5c904b9da61f6565f90.

<b>Name</b>	<b>Description</b>
Strike LockBit_49250b4a	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 49250b4aa060299f0c8f67349c942d1c.
Strike LockBit_5143e664	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 5143e664ed8a94496716597f7989829c.
Strike LockBit_53459a35	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 53459a35192496687d6e0137c044b342.
Strike LockBit_5761ee98	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 5761ee98b1c2fea31b5408516a8929ea.
Strike LockBit_5cc28691	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The MD5 hash of this LockBit sample is 5cc28691fdAA505b8f453e3500e3d690.
Strike LockBit_5f504bb2	This strike sends a malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. Strike LockBit_fd902870	This strike sends a polymorphic malware sample known as LockBit. LockBit is a ransomware that once executed will encrypt the system files until a ransom payment has been made to the attacker. LockBit can scan and spread itself to all targets it finds on a network. The binary has the checksum removed in the PE file format. The MD5 hash of this LockBit sample is fd902870de737723e6da1e0ba10f1385.

<b>Name</b>	<b>Description</b>
Strike Locky_0158743f	This strike sends a polymorphic malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Locky sample is 0158743f2c7571a83669159121daed44.
Strike Locky_28b5e374	This strike sends a polymorphic malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The binary has been packed using upx packer, with the default options. The MD5 hash of this Locky sample is 28b5e37490d59e2d5dff1c1a429263bf.
Strike Locky_37321e84	This strike sends a malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The MD5 hash of this Locky sample is 37321e84039a822ec547de8a9aad48a9.
Strike Locky_8048aa32	This strike sends a malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The MD5 hash of this Locky sample is 8048aa3289909b0f544bf7819a150a48.
Strike Locky_8ea1078a	This strike sends a polymorphic malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Locky sample is 8ea1078ae6f7500c9c1f245d69a8ce30.
Strike Locky_b73d624c	This strike sends a malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The MD5 hash of this Locky sample is b73d624c91955ec6780053f5c6c1e552.

<b>Name</b>	<b>Description</b>
Strike Locky_cb93d5c8	This strike sends a polymorphic malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The binary file has one more imports added in the import table. The MD5 hash of this Locky sample is cb93d5c8daa92eb0280f3ff3535b8d93.
Strike Locky_f4b19b8a	This strike sends a polymorphic malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Locky sample is f4b19b8a9fa2c1a3ac71e0d95acce031.
Strike Locky_fd28fdf1	This strike sends a polymorphic malware sample known as Locky. Locky is a ransomware for Windows systems which appeared at the beginning of 2016. The malicious code for this particular malware relies on JavaScript attachments to download itself. Like other ransomware, it encrypts local files as well as network shares and renames them to [unique_id][identifier].locky. The victim is requested to pay a ransom to get the files decrypted. The binary has random bytes appended at the end of the file. The MD5 hash of this Locky sample is fd28fdf16988f3400f266cc945b7fa79.
Strike LodaRAT_03f37674	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is 03f376743e551dacf7b9eddd8d96acea.
Strike LodaRAT_24bcd132	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is 24bcd1321b581ea0d7a00b9655a0cab2.
Strike LodaRAT_77cce071	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is 77cce071ed220fc2e85207850909d2df.
Strike LodaRAT_81e166e0	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is 81e166e0fe24ae2bc6c1332c3a3a7637.

<b>Name</b>	<b>Description</b>
Strike LodaRAT_8678d96c	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is 8678d96c170a982e363b1ccb4fada460.
Strike LodaRAT_9b240a9c	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is 9b240a9cfad431137cf86ed64bb4bdd0.
Strike LodaRAT_c2814562	This strike sends a malware sample known as LodaRAT. LodaRAT malware is a remote access tool that is written in AutoIT. It has the ability to gather information, exfiltrate data, deliver additional malware and capture screen data. This version steals cookies and passwords from Microsoft Edge and Brave. The MD5 hash of this LodaRAT sample is c281456208e2df0324fbf202e2f2c7b0.
Strike LokiBot_0160f5c8	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this LokiBot sample is 0160f5c8e9e1e2676d8d1f253ce8f8a8.
Strike LokiBot_01f2e3a9	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this LokiBot sample is 01f2e3a946d22c470784c71b442a2901.
Strike LokiBot_044a9395	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 044a9395038b80df64f21b475f2371f4.
Strike LokiBot_046776d8	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 046776d819a6a7d85b5d32fdb819cdeb.

<b>Name</b>	<b>Description</b>
Strike LokiBot_08ed7ada	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 08ed7ada50256212d5ff62819036ec92.
Strike LokiBot_0a698e88	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 0a698e8808618abeb1fbe9930d6d9fbc.
Strike LokiBot_0f454af3	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 0f454af34a3a6e3a26db1bc14e0c1ee3.
Strike LokiBot_0f58976f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 0f58976f87aea65297d838dd4cf2ecaf.
Strike LokiBot_0f61a60e	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 0f61a60ed23ae6ca13456293649e9125.
Strike LokiBot_11f9218f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 11f9218fbba0aa63ed8d2adcaabae67b.
Strike LokiBot_123f0bb7	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 123f0bb70e58dae81a3398cbe049c132.
Strike LokiBot_141c2a99	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 141c2a99ec6c365eefbcfe39e8dd84be3.

<b>Name</b>	<b>Description</b>
Strike LokiBot_14adebed	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this LokiBot sample is 14adebeddeb0619d03cd9509a64988c5.
Strike LokiBot_1679bcd8	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 1679bcd86e53758a0e9a8e66783002cd.
Strike LokiBot_16b925b3	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 16b925b3b891d0ba91552419b6c9a343.
Strike LokiBot_186e231b	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 186e231b1e4d0ff6626403f2c1f58906.
Strike LokiBot_1a3e6d36	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. Strike LokiBot_41aa2de6	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 41aa2de67067959254211d5970c35c63.
Strike LokiBot_42a27b7b	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 42a27b7b122f8e048980c0e7bf04b5c9.
Strike LokiBot_4389ba6f	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this LokiBot sample is 4389ba6f50000c82a7118a2d1015eadf.

<b>Name</b>	<b>Description</b>
Strike LokiBot_43b38e77	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 43b38e775099053f93f72ac9ab5bfc25.
Strike LokiBot_44fc10c3	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 44fc10c3b6cc2f42d2dacd19f9219915.
Strike LokiBot_45189936	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 45189936f6062b0e81a7dc44e3c1c6e7.
Strike LokiBot_47026faf	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 47026fafcb973ba3387e8c97f6871bb1.
Strike LokiBot_495fff18	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 495fff18bc8c631e44c00b273d0742d2.
Strike LokiBot_4973f991	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 4973f991a4f80bb49052af30e8922a17.
Strike LokiBot_4b043d0f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 4b043d0fccca4bea612f21dd3a4d7fd9.
Strike LokiBot_4d198d9c	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 4d198d9c0564a594ce46be7bce19edd6.

<b>Name</b>	<b>Description</b>
Strike LokiBot_4e52a06f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 4e52a06feec62c667f65ab9ffa4e1867.
Strike LokiBot_4edfba05	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random bytes appended at the end of the file. The MD5 hash of this LokiBot sample is 4edfba05c275b53b5a4e569ea760160c.
Strike LokiBot_502187ce	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 502187ce6d5d1f537c244b90435e9ca9.
Strike LokiBot_53b771d0	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 53b771d049bacdd030fe2424b9f7a7ef.
Strike LokiBot_572ee199	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 572ee199d9d6793f1b6f5a8696bb6532.
Strike LokiBot_574ea378	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 574ea37878e74bbcf646402baf723ee4.
Strike LokiBot_5885b5c9	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 5885b5c94d4e34a250d8e325a0727578.

<b>Name</b>	<b>Description</b>
Strike LokiBot_589813a9	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 589813a949474184438f1b7117457913.
Strike LokiBot_59b388de	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 59b388dee247bcecd66795063b0c02d7.
Strike LokiBot_5c5ad7f3	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 5c5ad7f35533f46e30133dba9186d4b1.
Strike LokiBot_5cc22a11	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this LokiBot sample is 5cc22a110c449112b320edf81f3b3330.
Strike LokiBot_5d6e02f7	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random bytes appended at the end of the file. The MD5 hash of this LokiBot sample is 5d6e02f77ca51f9a8d22da843ee87791.
Strike LokiBot_5dde0410	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 5dde041006ed3df18d4820a8b5208c09.
Strike LokiBot_5e0f32cb	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 5e0f32cb907fa23b7d4dc8c684e9720b.

<b>Name</b>	<b>Description</b>
Strike LokiBot_630f9c03	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 630f9c038b9d219998a29dda39680060.
Strike LokiBot_634d500f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 634d500f4ee3781a34e23394e57126dd.
Strike LokiBot_63e3bfaa	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 63e3bfaaa31cc2014010270ecfbc72be.
Strike LokiBot_64af1511	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 64af151191f5d60b7ace7a8cb31e7948.
Strike LokiBot_67f5daf1	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has the checksum removed in the PE file format. The MD5 hash of this LokiBot sample is 67f5daf17df5a86d4a89d9318402b84d.
Strike LokiBot_6882fe2e	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 6882fe2e90093a2bfd5d96371330e809.
Strike LokiBot_68c7222e	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 68c7222eb38c3fe88087cca91120bbe0.

<b>Name</b>	<b>Description</b>
Strike LokiBot_6bffac8e	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 6bffac8eeb297dd82fecf271f408ee81.
Strike LokiBot_6c2cd24b	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 6c2cd24b96a7cf4f1a2d4e4ba2b05453.
Strike LokiBot_6c8a1688	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 6c8a16888e371f15f0b018fb0ddaae2e.
Strike LokiBot_6f06a830	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 6f06a830e7610d4f2e9a1a5c2a4b542b.
Strike LokiBot_6f0a7ddc	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 6f0a7ddcbcf4446f2d2d230bff72a356.
Strike LokiBot_754ba410	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 754ba4100095de1dfb830d226af267eb.
Strike LokiBot_757d1361	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 757d13617a9b81777d56e85544fc1855.
Strike LokiBot_75aa607a	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 75aa607a9f8bf2af141de19a41b0bd94.

The MD5 hash of this LokiBot sample is 91f28ad2f9c1abf319254e802ff35ecf.
Strike LokiBot_928bd458	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 928bd4584eac8e3b8393510bb010cd20.
Strike LokiBot_92ccd05c	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 92ccd05c0b161385f503bd62c2f87995.
Strike LokiBot_92d1f7e5	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 92d1f7e5f1d35e4c3744798b583da7e8.
Strike LokiBot_933cb353	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 933cb35362f832513bd168c62ef1eb1f.
Strike LokiBot_944824b4	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this LokiBot sample is 944824b422c4603b89cc48a8a68420f6.
Strike LokiBot_95105b9f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 95105b9f79ad64a5187f3859a6e74347.

<b>Name</b>	<b>Description</b>
Strike LokiBot_97351713	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random bytes appended at the end of the file. The MD5 hash of this LokiBot sample is 97351713c1c618911aedc95981242a15.
Strike LokiBot_985dcd1f	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random bytes appended at the end of the file. The MD5 hash of this LokiBot sample is 985dcd1f24eba6bb96148752cc35bd28.
Strike LokiBot_9a1f1689	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9a1f1689b94d59c040af83f496ba5bbb.
Strike LokiBot_9a4c1fb2	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random bytes appended at the end of the file. The MD5 hash of this LokiBot sample is 9a4c1fb2d9f082a73e5bddc76573d1b3.
Strike LokiBot_9a53b56a	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9a53b56adece33768f427031a3e068d.
Strike LokiBot_9c3d5fda	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9c3d5fda30d4b32841708d7d7f99c62a.
Strike LokiBot_9cfa5f2f	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9cfa5f2f4aacce5f0f676f2e3b32663f.

<b>Name</b>	<b>Description</b>
Strike LokiBot_9d420f07	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9d420f07ba12c973e525b788c36341a3.
Strike LokiBot_9e4f03f3	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9e4f03f3d598a06898632f10b4eaec6a.
Strike LokiBot_9ec2a2e6	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is 9ec2a2e68f07d83c5904dde328c2f594.
Strike LokiBot_a0294d29	This strike sends a polymorphic malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this LokiBot sample is a0294d29cced97c582a53fd7e42922ee.
Strike LokiBot_a4e9151e	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is a4e9151e7fcc3e22e4be8030681c6781.
Strike LokiBot_a85424f2	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is a85424f2fb6f690b5f336928355673d1.
Strike LokiBot_a862611c	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is a862611c1be0659cbde96a3d3f79ba61.

The MD5 hash of this LokiBot sample is eb9603a9904e78f85911398887281718.
Strike LokiBot_eca2cb25	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is eca2cb25c919294dcaec338b4ba882d5.
Strike LokiBot_f176e605	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is f176e6052a3f5832a24ab1d55eda274e.
Strike LokiBot_f22fa361	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is f22fa36134c5405dad05e172bdef8edf.
Strike LokiBot_f3821f00	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is f3821f00986bcfae38622179fc49f5c.
Strike LokiBot_f520c950	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is f520c950b540931fb502ad1fcc6e5ec.
Strike LokiBot_f696499b	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is f696499b3888e3cedefce687917c127d.
Strike LokiBot_f977b8f3	This strike sends a malware sample known as LokiBot. Lokibot is an information-stealing malware designed to siphon off sensitive information stored on an infected device. It is modular in nature, supporting the ability to steal sensitive information from a number of popular applications. It is commonly pushed via malicious documents delivered via spam emails. The MD5 hash of this LokiBot sample is f977b8f3919dc992d6ffe3fd0505815a.

Strike LunarSpider_21cde10c	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 21cde10c7da48bab622e75d6004d61de.

<b>Name</b>	<b>Description</b>
Strike LunarSpider_2a743bcc	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 2a743bcc9cee1900a0457127abeade60.
Strike LunarSpider_2c3d09cd	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 2c3d09cd1d8aea8cc7049296782c8def.
Strike LunarSpider_330a6bae	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 330a6bae00ad4be4a0df732520905395.
Strike LunarSpider_33f6c6b3	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. The MD5 hash of this LunarSpider sample is 33f6c6b3727a233819111e3b3aae96ec.
Strike LunarSpider_3f21939c	This strike sends a malware sample known as LunarSpider. Lunar Spider is a malware of the banking trojan family that is used to steal financial information and facilitate further compromise. It is delivered primarily via malvertising and email campaigns, which lead victims to a fake CAPTCHA webpage that tricks them into downloading a malicious installer. When executed, the installer loads the IcedID payload and establishes persistence on the infected system. Its key capabilities include credential theft, collection of banking information, system reconnaissance, and enabling follow-on access for additional malware deployment. Once executed the malware duplicates itself and begins enabling persistence by creating a registry key. The malware communicates to the C2 server via the MQTT protocol and includes functionality to detect debugging and monitoring tools in order to evade detection. This file is the RAR archive used to distribute MQSTTang. The MD5 hash of this MQsTTang RAR sample is 3017fd573639f7cc0f82b941becc18ca.

Name	Description
Strike MQsTTang RAR_b26099e4	This strike sends a malware sample known as MQsTTang RAR. MQsTTang is malware backdoor that has been attributed to the Mustang Panda APT group. This group has focused primarily on political organizations in Europe and Asia. The Mustang Panda group uses phishing emails to distribute the malware and Github to host the payloads. Once executed the malware duplicates itself and begins enabling persistence by creating a registry key. The malware communicates to the C2 server via the MQTT protocol and includes functionality to detect debugging and monitoring tools in order to evade detection. This file is the RAR archive used to distribute MQSTTang. The MD5 hash of this MQsTTang RAR sample is b26099e4d1af79e5d4c8cec7888e50e4.

Strike Mandrake_1b579842	This strike sends a malware sample known as Mandrake. Mandrake is a sophisticated malware that operates in multiple stages, starting with a dropper that downloads the payload from a command-and-control (C2) server. It collects detailed device information, including installed apps and external IP, and requests permissions to run in the background. In its final stage, Mandrake steals user credentials by loading URLs, initiating remote screen-sharing sessions, and recording the device's screen. It bypasses Android 13 security features using a session-based installer, to evade detection and infiltrate official app marketplaces. The MD5 hash of this Mandrake sample is 1b579842077e0ec75346685ffd689d6e.
Strike Mandrake_202b5c05	This strike sends a malware sample known as Mandrake. Mandrake is a sophisticated malware that operates in multiple stages, starting with a dropper that downloads the payload from a command-and-control (C2) server. It collects detailed device information, including installed apps and external IP, and requests permissions to run in the background. In its final stage, Mandrake steals user credentials by loading URLs, initiating remote screen-sharing sessions, and recording the device's screen. It bypasses Android 13 security features using a session-based installer, to evade detection and infiltrate official app marketplaces. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is b9078b6db33deb83201c8d2ccb3ced4e.
Strike Maze_b93616a1	This strike sends a malware sample known as Maze. Maze, also known as ChaCha, is ransomware not only known for encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is b93616a1ea4f4a131cc0507e6c789f94.
Strike Maze_bd9838d8	This strike sends a malware sample known as Maze. Maze malware also known as ChaCha ransomware is known for not only encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is bd9838d84fd77205011e8b0c2bd711e0.

<b>Name</b>	<b>Description</b>
Strike Maze_c043c153	This strike sends a malware sample known as Maze. Maze malware also known as ChaCha ransomware is known for not only encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is c043c153237b334df2f2934f7640e802.
Strike Maze_d6e2396d	This strike sends a malware sample known as Maze. Maze, also known as ChaCha, is ransomware not only known for encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is d6e2396df72ada10e2bbf0f48cb70462.
Strike Maze_f190f9be	This strike sends a malware sample known as Maze. Maze, also known as ChaCha, is ransomware not only known for encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is f190f9be2a9e5fca00029676722f3e78.
Strike Maze_f83cef2b	This strike sends a malware sample known as Maze. Maze, also known as ChaCha, is ransomware not only known for encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is f83cef2bf33a4d43e58b771e81af3ecc.
Strike Maze_fba4ccb7	This strike sends a malware sample known as Maze. Maze malware also known as ChaCha ransomware is known for not only encrypting files on the targeted system but for releasing stolen victim information to the public if the ransom is not paid. The ransomware has been delivered via several methods including exploits kits, remote desktop connections and phishing emails. This malware also utilizes many anti reversing and analysis features that make examining it much more difficult. The MD5 hash of this Maze sample is fba4ccb7167176990d5a8d24e9505f71.
Strike Meduza Stealer_45f0b444	This strike sends a malware sample known as Meduza Stealer. Meduza Stealer is a browser data stealer malware. It steals login credentials, browsing history, bookmarks, crypto wallets, password manager data, and 2FA extensions. The MD5 hash of this Meduza Stealer sample is 45f0b444f8de5bf28ffc312212935284.
Strike Mimic_01ff843b	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 01ff843b385a9e4d58e4a892fda02fd5.

<b>Name</b>	<b>Description</b>
Strike Mimic_102bd157	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 102bd157676e752d4e9311b5d17f9d5c.
Strike Mimic_1de4fcc8	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 1de4fcc80167b96285656de16f91c7d1.
Strike Mimic_5120980c	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 5120980c01763759fbc8785899809e6a.
Strike Mimic_6a690a6b	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 6a690a6bf79312af5bebc814e99ea84a.
Strike Mimic_8fb35a35	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 8fb35a353978f59bd81e1e605855965e.
Strike Mimic_9e9c2fc8	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is 9e9c2fc872e905817c5501d07ef946b1.
Strike Mimic_a16b5846	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is a16b58464d8874f358687c49e5d06806.
Strike Mimic_a626eaec	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is a626eaec2acc8605825b63e2ca1be83f.
Strike Mimic_ac34ba84	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is ac34ba84a5054cd701efad5dd14645c9.

<b>Name</b>	<b>Description</b>
Strike Mimic_b92a2606	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is b92a26068ba3653d8ec491f9702843e7.
Strike Mimic_bc78159e	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is bc78159e7368ca429fcba29e97fc4da6.
Strike Mimic_db21ed7d	This strike sends a malware sample known as Mimic. Mimic is a ransomware that abuses the APIs of the Everything tool to query files to be encrypted. It has the ability to delete shadow copies, disable Windows Defender, terminate applications and services and perform a variety of other functions. The MD5 hash of this Mimic sample is db21ed7d19149a615d7432aca9c8f6ca.
Strike Minibike_01cbadd	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 01cbadd7a269521bf7b80f4a9a1982f.
Strike Minibike_054c6723	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 054c67236a86d9ab5ec80e16b884f733.
Strike Minibike_2c4cdc0e	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 2c4cdc0e78ef57b44f11f7ec2f6164cd.
Strike Minibike_3b658afa	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 3b658afa91ce3327dbfa1cf665529a6d.
Strike Minibike_409c2ac7	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 409c2ac789015e76f9886f1203a73bc0.
Strike Minibike_664cfda4	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 664cfda4ada6f8b7bb25a5f50cccf984.

<b>Name</b>	<b>Description</b>
Strike Minibike_68f6810f	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 68f6810f248d032bbb65b391cdb1d5e0.
Strike Minibike_691d0143	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 691d0143c0642ff783909f983ccb8ffd.
Strike Minibike_710d1a8b	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 710d1a8b2fc17c381a7f20da5d2d70fc.
Strike Minibike_75d2c686	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 75d2c686d410ec1f880a6fd7a9800055.
Strike Minibike_909a235a	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is 909a235ac0349041b38d84e9aab3f3a1.
Strike Minibike_adef679c	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is adef679c6aa6860aa89b775dceb6958b.
Strike Minibike_bfd024e6	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is bfd024e64867e6ca44738dd03d4f87b5.
Strike Minibike_c12ff86d	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is c12ff86d32bd10c6c764b71728a51bce.
Strike Minibike_cf32d73c	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is cf32d73c501d5924b3c98383f53fda51.

<b>Name</b>	<b>Description</b>
Strike Minibike_d94ffe66	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is d94ffe668751935b19eaeb93fed1cdbe.
Strike Minibike_e3dc8810	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is e3dc8810da71812b860fc59aeadcc350.
Strike Minibike_e9ed595b	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is e9ed595b24a7eeb34ac52f57eec6e2b.
Strike Minibike_eadbaabe	This strike sends a malware sample known as Minibike. Minibike is a backdoor that performs directory and file enumeration, exfiltration, upload, and command execution. The malware uses the Azure cloud infrastructure for command and control communication. The MD5 hash of this Minibike sample is eadbaabe3b8133426bcf09f7102088d4.
Strike Minibus_05fcace6	This strike sends a malware sample known as Minibus. Minibus similar to the closely related Minibike malware is a backdoor that has a command interface and advanced reconnaissance features. It includes features like process enumeration and performs command and control communication utilizing a combination of Azure cloud infrastructure and .com domains. The MD5 hash of this Minibus sample is 05fcace605b525f1bece1813bb18a56c.
Strike Minibus_4ed5d74a	This strike sends a malware sample known as Minibus. Minibus similar to the closely related Minibike malware is a backdoor that has a command interface and advanced reconnaissance features. It includes features like process enumeration and performs command and control communication utilizing a combination of Azure cloud infrastructure and .com domains. The MD5 hash of this Minibus sample is 4ed5d74a746461d3faa9f96995a1eec8.
Strike Minibus_816af741	This strike sends a malware sample known as Minibus. Minibus similar to the closely related Minibike malware is a backdoor that has a command interface and advanced reconnaissance features. It includes features like process enumeration and performs command and control communication utilizing a combination of Azure cloud infrastructure and .com domains. The MD5 hash of this Minibus sample is 816af741c3d6be1397d306841d12e206.
Strike Minibus_c5dc2c75	This strike sends a malware sample known as Minibus. Minibus similar to the closely related Minibike malware is a backdoor that has a command interface and advanced reconnaissance features. It includes features like process enumeration and performs command and control communication utilizing a combination of Azure cloud infrastructure and .com domains. The MD5 hash of this Minibus sample is c5dc2c75459dc99a42400f6d8b455250.

<b>Name</b>	<b>Description</b>
Strike Minibus_f58e0dfb	This strike sends a malware sample known as Minibus. Minibus similar to the closely related Minibike malware is a backdoor that has a command interface and advanced reconnaissance features. It includes features like process enumeration and performs command and control communication utilizing a combination of Azure cloud infrastructure and .com domains. The MD5 hash of this Minibus sample is f58e0dfb8f915fa5ce1b7ca50c46b51b.
Strike Mirai TBOT_013183e9	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is 013183e99a5ca41e36da2bf5a1d4ad5e.
Strike Mirai TBOT_0f98a0c5	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is 0f98a0c5a171e4b76504c1364744e21d.
Strike Mirai TBOT_1ce7682e	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is 1ce7682e9f661823bf5227f32a5d994f.
Strike Mirai TBOT_2dbd24f9	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is 2dbd24f9bec506e7f588bcb5939066d1.
Strike Mirai TBOT_397143ff	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is 397143ff0e9473c0d9325b54e47db40d.
Strike Mirai TBOT_401d2428	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is 401d24286653075ef5fe54534c2db798.

It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is ebf1a637e7c45e96da5c9382562d850d.

<b>Name</b>	<b>Description</b>
Strike Mirai TBOT_f3dd2282	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is f3dd22821a86cd9f91c01bb30286cc85.
Strike Mirai TBOT_f88fd951	This strike sends a malware sample known as Mirai TBOT. Mirai.TBOT is a sophisticated Mirai botnet distinguished by its extensive use of over 100 bot groups, each employing unique infection methods. It possesses the capability to exploit zero-day vulnerabilities and utilizes OpenNIC custom C2 domains. The botnet operates on a massive scale and is primarily employed for DDoS attacks. The MD5 hash of this Mirai TBOT sample is f88fd951081f09617d5703ccefc5d356.
Strike Mispadu MSI_1a03283c	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 1a03283cca237aed77a57229b69fd4c8.
Strike Mispadu MSI_2ddc9977	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 2ddc997762f32dd0ad3ca4771d39dbd7.
Strike Mispadu MSI_40453db5	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 40453db553c3656c9083179361cf4765.
Strike Mispadu MSI_540118ed	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 540118ed71408b7bc31049ffd807086f.

<b>Name</b>	<b>Description</b>
Strike Mispadu MSI_6a449567	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 6a449567f353dce7cfef5bc10c334655.
Strike Mispadu MSI_6bfcfddf	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 6bfcfdd1c04f07adfea18227857e5cf.
Strike Mispadu MSI_7acf4aed	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 7acf4aed2fb50d6de5b0f57302070b88.
Strike Mispadu MSI_8027bb46	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is 8027bb46ec1892abe98bb0d18902d93a.
Strike Mispadu MSI_c1353d21	This strike sends a malware sample known as Mispadu MSI. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the MSI. The MD5 hash of this Mispadu MSI sample is c1353d2194f2ae2ecf5f82434137c426.

<b>Name</b>	<b>Description</b>
Strike Mispadu PDF_238e4731	This strike sends a malware sample known as Mispadu PDF. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the initial pdf. The MD5 hash of this Mispadu PDF sample is 238e4731b4d05011ccec45ccc28c6c7b.
Strike Mispadu PDF_3b307fac	This strike sends a malware sample known as Mispadu PDF. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the initial pdf. The MD5 hash of this Mispadu PDF sample is 3b307facf2b5e411f05159fbedabc3bf.
Strike Mispadu VBS_15465965	This strike sends a malware sample known as Mispadu VBS. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the VBScript. The MD5 hash of this Mispadu VBS sample is 1546596599992042b708d99c5bc1e7d1.
Strike Mispadu VBS_52a21157	This strike sends a malware sample known as Mispadu VBS. Mispadu also known as Ursu is a banking trojan that uses phishing emails in order to exfiltrate sensitive credentials. First the email contains a pdf that lures the victim to initiate a download of a zip file that contains an MSI installer or HTA script. The execution of these eventually lead to the download and execution of a couple VBScripts and finally an AutoIT script that loads a dll into memory. The main payload extracts browser and email client credentials. This sample is the VBScript. The MD5 hash of this Mispadu VBS sample is 52a21157625540fb8b36e8e255da5f17.
Strike Mispadu VBS_8c1008f3	This strike sends a malware sample known as Mispadu VBS. MuddyWater utilizes spear phishing emails with password-protected archives and executables to spread its malicious payloads. This executable contains an embedded PowerShell script that automatically connects to MuddyWater's C2, eliminating the need for manual execution by attackers. The response from the C2 is also a PowerShell script that runs every 10 seconds and waits for commands from the attacker using the C2. The MD5 hash of this MuddyC2Go sample is b867ec1cef6b1618a21853fb8cafd6e1.</p>
Strike MuddyC2Go_d3a2dee3	<p>This strike sends a malware sample known as MuddyC2Go. MuddyC2Go is a Command and Control (C2) framework utilized by the MuddyWater Advanced Persistent Threat (APT). This framework's web component is coded in Go, distinguishing it from its predecessor PhonyC2. MuddyWater utilizes spear phishing emails with password-protected archives and executables to spread its malicious payloads. This executable contains an embedded PowerShell script that automatically connects to MuddyWater's C2, eliminating the need for manual execution by attackers. The response from the C2 is also a PowerShell script that runs every 10 seconds and waits for commands from the attacker using the C2. <b>Name</b>	<b>Description</b>
Strike Nefilim_053ec539	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 053ec539c138afb99054bd362bb3ed71.
Strike Nefilim_0790a7e0	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 0790a7e0a842e1de70de194054fa11b3.
Strike Nefilim_26c35850	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 26c35850483c877ee23f476b38d58deb.
Strike Nefilim_3beb3d46	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 3beb3d466bcc0977ec2dd66d72ab6bb3.
Strike Nefilim_5ff20e2b	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 5ff20e2b723edb2d0fb27df4fc2c4468.
Strike Nefilim_659c4b68	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 659c4b68f2027905def1af9249feeb3.

Strike Nefilim_7354e71d	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 7354e71d9c28e0c150cea3377e5f70d9.
Strike Nefilim_80cfda61	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 80cfda61942eb4e71f286297a1158f48.
Strike Nefilim_8f90539c	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is 8f90539c405672016c0dec7ac3574eea.
Strike Nefilim_ce3cd1da	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is ce3cd1dab67814f5f153bccdaf502f4c.
Strike Nefilim_dc88265c	This strike sends a malware sample known as Nefilim. Nefilim ransomware shares much of its code with the popular RaaS known as Nemty, however, Nefilim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Nefilim sample is dc88265c361d73540a31c19583271fb0.

<b>Name</b>	<b>Description</b>
Strike Neflim_ddc50d4a	This strike sends a malware sample known as Neflim. Neflim ransomware shares much of its code with the popular RaaS known as Nemty, however, Neflim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Neflim sample is ddc50d4ae0674d854a845b3eb32508c3.
Strike Neflim_dfd4dbfd	This strike sends a malware sample known as Neflim. Neflim ransomware shares much of its code with the popular RaaS known as Nemty, however, Neflim instructs victims to contact the attackers via email rather than through a payment portal. Victims are mainly infected through vulnerable RDP services. Once the system has been infected, the malware establishes persistence and begins to exfiltrate credentials where possible. It will then deliver the ransomware payloads to the intended targets. The MD5 hash of this Neflim sample is dfd4dbfd7cbd6179fc371e5f887f189c.
Strike Nemty_0b33471b	This strike sends a malware sample known as Nemty. Nemty is a Ransomware-as-a-Service. Once obtained a user is granted access to a web portal where they are able to create custom versions of the ransomware. It has been spotted being delivered via email spam (malspam) campaigns, botnets, exploit kits, pay-pal dummy sites, and by brute-forcing RDP endpoints. The MD5 hash of this Nemty sample is 0b33471bbd9fb9f08983eff34ee4ddc9.
Strike Nemty_0e0b7b23	This strike sends a malware sample known as Nemty. Nemty is a Ransomware-as-a-Service. Once obtained a user is granted access to a web portal where they are able to create custom versions of the ransomware. It has been spotted being delivered via email spam (malspam) campaigns, botnets, exploit kits, pay-pal dummy sites, and by brute-forcing RDP endpoints. The MD5 hash of this Nemty sample is 0e0b7b238a06a2a37a4de06a5ab5e615.
Strike Nemty_0f3deda4	This strike sends a malware sample known as Nemty. Nemty is a Ransomware-as-a-Service. Once obtained a user is granted access to a web portal where they are able to create custom versions of the ransomware. It has been spotted being delivered via email spam (malspam) campaigns, botnets, exploit kits, pay-pal dummy sites, and by brute-forcing RDP endpoints. The MD5 hash of this Nemty sample is 0f3deda483df5e5f8043ea20297d243b.
Strike Nemty_348c3597	This strike sends a malware sample known as Nemty. Nemty is a Ransomware-as-a-Service. Once obtained a user is granted access to a web portal where they are able to create custom versions of the ransomware. It has been spotted being delivered via email spam (malspam) campaigns, botnets, exploit kits, pay-pal dummy sites, and by brute-forcing RDP endpoints. The MD5 hash of this Nemty sample is 348c3597c7d31c72ea723d5f7082ff87.
Strike Nemty_37aab6b	This strike sends a malware sample known as Nemty. Nemty is a Ransomware-as-a-Service. Once obtained a user is granted access to a web portal where they are able to create custom versions of the ransomware. It has been spotted being delivered via email spam (malspam) campaigns, botnets, exploit kits, pay-pal dummy sites, and by brute-forcing RDP endpoints. The MD5 hash of this Nemty sample is 37aab6b18c9c1b8150dae4f1d31e97d.

It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 239163e6019670e326087aa59adb5007.
Strike Netwalker_25c0fde0	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 25c0fde038e01fe84fd3df69c99e60a1.
Strike Netwalker_2f720c55	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 2f720c55dc1969da5299a45e031816ae.
Strike Netwalker_3cf36a7	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 3cf36a72db703e25aecd51eb74f0feb.
Strike Netwalker_4e59fba2	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 4e59fba21c5e9ec603f28a92d9efd8d0.
Strike Netwalker_59b00f60	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 59b00f607a7550af9a2332c730892845.
Strike Netwalker_5ce75526	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 5ce75526a25c81d0178d8092251013f0.
Strike Netwalker_5f55ac3d	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 5f55ac3dd18950583dadfffc1970745c5.
Strike Netwalker_608ac26e	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 608ac26ea80c189ed8e0f62dd4fd8ada.

<b>Name</b>	<b>Description</b>
Strike Netwalker_63eb7712	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 63eb7712d7c9d495e8a6be937bdb1960.
Strike Netwalker_645c720f	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 645c720ff0eb7d946ec3b4a6f609b7bc.
Strike Netwalker_6528c101	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 6528c1013ddb23f6eeeca08d02f3d7834.
Strike Netwalker_747dc998	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 747dc998c4cf60c6d40a77de18a9aa62.
Strike Netwalker_8fbc17d6	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 8fbc17d634009cb1ce261b5b3b2f2ecb.
Strike Netwalker_9172586c	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 9172586c2f870ab76eb0852d1f4dfaef.
Strike Netwalker_93f91bfc	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is 93f91bfcc1bf0c858fc7f3bd4536eba6.
Strike Netwalker_b49ea177	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is b49ea17739f484b2ccccf79f245186f3.
Strike Netwalker_bc758596	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is bc75859695f6c2c5ceda7e3be68e5d5a.

<b>Name</b>	<b>Description</b>
Strike Netwalker_cb78a77e	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is cb78a77e9ab26e4cf759e7d7b34bdbdc.
Strike Netwalker_cc113e42	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is cc113e42c52c6e4e7beca74829b89a68.
Strike Netwalker_d09cfda2	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is d09cfda29f178f57dbce6895cfb68372.
Strike Netwalker_dabbc5e5	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is dabbc5e50b9275cb2996c50fd81e64b4.
Strike Netwalker_f957f19c	This strike sends a malware sample known as Netwalker. Netwalker, also known as Mailto is Ransomware that encrypts Windows files on the compromised enterprise networks with the mailto extension. It uses the network of the victim to encrypt all Windows devices. The MD5 hash of this Netwalker sample is f957f19cd9d71abe3cb980ebe7f75d72.
Strike Nevada_b673d92b	This strike sends a malware sample known as Nevada. Nevada is ransomware written in Rust and is identified by the way in which it adds the .NEVADA extension to its encrypted files. This has the ability to delete itself, load hidden drives, encrypt shared folders, and run itself in safe mode. The MD5 hash of this Nevada sample is b673d92b77489d12779dc1fb5e8f6fdd.
Strike NineRAT_12e39941	This strike sends a malware sample known as NineRAT. NineRAT is a Remote Access Trojan (RAT) identified in the Lazarus Group's Operation Blacksmith campaign. It targets global enterprises, particularly those susceptible to n-day vulnerabilities like CVE-2021-44228, Lazarus focuses on industries such as manufacturing and security. NineRAT uses Telegram as a Command and Control (C2) channel, leveraging a legitimate service to avoid detection. The malware comprises a dropper, an instrumentor, and the RAT itself, demonstrating persistence through BAT scripts. The malware interacts with Telegram's API implemented using Dlang-based libraries for tasks such as authentication testing and file transfers. The MD5 hash of this NineRAT sample is 12e399411185e386c863954eaa6f6595.

<b>Name</b>	<b>Description</b>

Strike Nood RAT_0a35e06f	This strike sends a malware sample known as Nood RAT. Nood RAT is a backdoor malware which is a Linux-compatible variant of Gh0st RAT. It enables threat actors to execute remote commands, manage files, and establish Socks proxies and port forwarding. It facilitates malicious activities such as downloading files, stealing internal files, executing commands, and serving as a proxy during lateral movement. The malware incorporates encryption to evade detection and operates based on commands received from the C&C server. The MD5 hash of this Nood RAT sample is 0a35e06f53c17ab1c8e18e7e0c0821d8.
Strike Nood RAT_35743db3	This strike sends a malware sample known as Nood RAT. Nood RAT is a backdoor malware which is a Linux-compatible variant of Gh0st RAT. It enables threat actors to execute remote commands, manage files, and establish Socks proxies and port forwarding. It facilitates malicious activities such as downloading files, stealing internal files, executing commands, and serving as a proxy during lateral movement. The malware incorporates encryption to evade detection and operates based on commands received from the C&C server. The MD5 hash of this Nood RAT sample is 35743db3dc333245ef5b69100721ced9.
Strike Nood RAT_4f3afdcf	This strike sends a malware sample known as Nood RAT. Nood RAT is a backdoor malware which is a Linux-compatible variant of Gh0st RAT. Strike Noon_e6de7580	This strike sends a malware sample known as Noon. Noon malware can execute other malware binaries. Once deployed it will connect to remote servers and push sensitive information to the attackers. This malware also maintains persistence on the victim machines. The MD5 hash of this Noon sample is e6de7580d7646c8b3f2cfb317734512a.
Strike Ntopsy_4a7ed329	This strike sends a malware sample known as Ntopsy. Ntopsy is a malware categorized as a Network Provider DLL module, strategically designed for the theft of user credentials. This malicious tool is adept at establishing backdoor capabilities, enabling command and control (C2), and exfiltrating sensitive information. To execute credential theft, the threat actor deploys a custom DLL module functioning as a Network Provider. Through the manipulation of the authentication process, Ntopsy gains access to user credentials whenever authentication attempts are made. The MD5 hash of this Ntopsy sample is 4a7ed329d2fc81b2561e520edaa5dc2b.
Strike Ntopsy_626adb5f	This strike sends a malware sample known as Ntopsy. Ntopsy is a malware categorized as a Network Provider DLL module, strategically designed for the theft of user credentials. This malicious tool is adept at establishing backdoor capabilities, enabling command and control (C2), and exfiltrating sensitive information. To execute credential theft, the threat actor deploys a custom DLL module functioning as a Network Provider. Through the manipulation of the authentication process, Ntopsy gains access to user credentials whenever authentication attempts are made. The MD5 hash of this Ntopsy sample is 626adb5fa6ee8a718e1dc7d5397e56ca.

To execute credential theft, the threat actor deploys a custom DLL module functioning as a Network Provider. Through the manipulation of the authentication process, Ntopsy gains access to user credentials whenever authentication attempts are made. The MD5 hash of this Ntopsy sample is c49d5658f785b2cc9608755d5ace2add.
Strike Ntopsy_dfe57386	This strike sends a malware sample known as Ntopsy. Ntopsy is a malware categorized as a Network Provider DLL module, strategically designed for the theft of user credentials. This malicious tool is adept at establishing backdoor capabilities, enabling command and control (C2), and exfiltrating sensitive information. To execute credential theft, the threat actor deploys a custom DLL module functioning as a Network Provider. Through the manipulation of the authentication process, Ntopsy gains access to user credentials whenever authentication attempts are made. The MD5 hash of this Ntopsy sample is dfe573867aff9267fc8d7926c5a8454e.
Strike Ntopsy_fd37b309	This strike sends a malware sample known as Ntopsy. Ntopsy is a malware categorized as a Network Provider DLL module, strategically designed for the theft of user credentials. This malicious tool is adept at establishing backdoor capabilities, enabling command and control (C2), and exfiltrating sensitive information. To execute credential theft, the threat actor deploys a custom DLL module functioning as a Network Provider. Through the manipulation of the authentication process, Ntopsy gains access to user credentials whenever authentication attempts are made. The MD5 hash of this Ntopsy sample is fd37b309870f9fb200232b1051431831.
Strike ONNX Store_0250a5ba	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 0250a5ba26791e7ffddb4b294d486479.
Strike ONNX Store_10d6e16a	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 10d6e16a05965be5bc0059131dc5ae7c.

<b>Name</b>	<b>Description</b>
Strike ONNX Store_15ef89d1	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 15ef89d1a2aa023ab664e1adcd75cbfd.
Strike ONNX Store_1932d823	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 1932d8238769b203693d1bbb56e541d2.
Strike ONNX Store_2a0576dc	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 2a0576dc8628b3f27190755d291750e4.
Strike ONNX Store_3f042b12	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 3f042b126e54b3a57485bf034d31fb39.
Strike ONNX Store_6193c137	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 6193c137f3b5b0da106b86f74670cf6f.
Strike ONNX Store_69804443	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 6980444399f1de17eec169e844d0b30e.
Strike ONNX Store_83dac377	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is 83dac37771e8592e006f671666ebf590.
Strike ONNX Store_d125e7ed	This strike sends a malware sample known as ONNX Store. ONNX Store is a PhaaS or Phishing-as-a-Platform malware. The attack resembles an original Microsoft 365 login page that will tricks users into entering their authentication credentials. This new PhaaS ONNX has the ability to control their operations via Telegram bots and support is provided by a support channel. The MD5 hash of this ONNX Store sample is d125e7ed32bc2ce320489f5b5cd3ffdc.

Name	Description
Strike OneClik_0689b3ce	This strike sends a malware sample known as OneClik. This strike sends a malware sample known as OneClik RunnerBeacon. OneClik is a ClickOnce-based loader that delivers RunnerBeacon, a Golang backdoor used in red team campaigns targeting energy infrastructure. It abuses ClickOnce manifests hosted on Azure to launch dfsvc.exe, which is hijacked using AppDomainManager injection to load a .NET loader. RunnerBeacon executes in memory, uses RC4-encrypted MessagePack for C2 over AWS services like CloudFront and API Gateway, and performs shell commands, file operations, port scanning, and tunneling, while evading detection through anti-analysis checks. The MD5 hash of this OneClik sample is 0689b3ce6ace42d324a70c8dc3bf1b85.
Strike OneClik_129399b8	This strike sends a malware sample known as OneClik. This strike sends a malware sample known as OneClik RunnerBeacon. OneClik is a ClickOnce-based loader that delivers RunnerBeacon, a Golang backdoor used in red team campaigns targeting energy infrastructure. It abuses ClickOnce manifests hosted on Azure to launch dfsvc.exe, which is hijacked using AppDomainManager injection to load a .NET loader. RunnerBeacon executes in memory, uses RC4-encrypted MessagePack for C2 over AWS services like CloudFront and API Gateway, and performs shell commands, file operations, port scanning, and tunneling, while evading detection through anti-analysis checks. The MD5 hash of this OneClik sample is 129399b838d6526751faf16ecea92942.
Strike OneClik_22850f5d	This strike sends a malware sample known as OneClik. This strike sends a malware sample known as OneClik RunnerBeacon. OneClik is a ClickOnce-based loader that delivers RunnerBeacon, a Golang backdoor used in red team campaigns targeting energy infrastructure. It abuses ClickOnce manifests hosted on Azure to launch dfsvc.exe, which is hijacked using AppDomainManager injection to load a .NET loader. RunnerBeacon executes in memory, uses RC4-encrypted MessagePack for C2 over AWS services like CloudFront and API Gateway, and performs shell commands, file operations, port scanning, and tunneling, while evading detection through anti-analysis checks. The MD5 hash of this OneClik sample is 22850f5d9467812c648996db617af3d7.
Strike OneClik_2afcc359	This strike sends a malware sample known as OneClik. This strike sends a malware sample known as OneClik RunnerBeacon. OneClik is a ClickOnce-based loader that delivers RunnerBeacon, a Golang backdoor used in red team campaigns targeting energy infrastructure. It abuses ClickOnce manifests hosted on Azure to launch dfsvc.exe, which is hijacked using AppDomainManager injection to load a .NET loader. RunnerBeacon executes in memory, uses RC4-encrypted MessagePack for C2 over AWS services like CloudFront and API Gateway, and performs shell commands, file operations, port scanning, and tunneling, while evading detection through anti-analysis checks. Strike Onyx Sleet Proxy_19a05a55	This strike sends a malware sample known as Onyx Sleet Proxy. Onyx Sleet Proxy Tool, this proxy tool loader is malware that has been associated with the Onyx Sleet North Korean cyber attacks that follow successful exploitation of a TeamCity Service. The malware is a payload responsible for setting up a persistent connection between the compromised host and a remote C2 server. The MD5 hash of this Onyx Sleet Proxy sample is 19a05a559b0c478f3049cd414300a340.

Name	Description
Strike Operation Digital Eye_00a928b6	This strike sends a malware sample known as Operation Digital Eye. Operation Digital Eye is a cyberespionage attack campaign that took place in the summer months of 2024. The exact threat actors associated with the attack are unknown but it is currently being linked to several Chinese APT groups. Initial access was obtained via SQL injection vulnerabilities, and to establish the attackers used a PHP webshell. The malware used in the campaign allowed for credential exfiltration via dumping the LSASS memory and SAM database. They then moved laterally across the network with RDP and pass-the-hash techniques utilizing a custom Mimikatz executable. Finally the attackers used a custom digitally signed version of Visual Studio Code run with winsw to allow the binary to run as a service to create a tunnel for the attackers to communicate with. This malware is one of the binaries used in this attack campaign. The MD5 hash of this Operation Digital Eye sample is 00a928b681e545c0ae859c56f2dfd160.

The malware used in the campaign allowed for credential exfiltration via dumping the LSASS memory and SAM database. They then moved laterally across the network with RDP and pass-the-hash techniques utilizing a custom Mimikatz executable. Finally the attackers used a custom digitally signed version of Visual Studio Code run with winsw to allow the binary to run as a service to create a tunnel for the attackers to communicate with. This malware is one of the binaries used in this attack campaign. The MD5 hash of this Operation Digital Eye sample is 987a5fb6e281db083e26619b74057be0.</p>
Strike Operation Digital Eye_a2cf1e86	<p>This strike sends a malware sample known as Operation Digital Eye. Operation Digital Eye is a cyberespionage attack campaign that took place in the summer months of 2024. The exact threat actors associated with the attack are unknown but it is currently being linked to several Chinese APT groups. Initial access was obtained via SQL injection vulnerabilities, and to establish the attackers used a PHP webshell. The malware used in the campaign allowed for credential exfiltration via dumping the LSASS memory and SAM database. They then moved laterally across the network with RDP and pass-the-hash techniques utilizing a custom Mimikatz executable. Finally the attackers used a custom digitally signed version of Visual Studio Code run with winsw to allow the binary to run as a service to create a tunnel for the attackers to communicate with. This malware is one of the binaries used in this attack campaign. The MD5 hash of this Operation Digital Eye sample is a2cf1e86c993d23a51022fc7784a84eb.</p>

<b>Name</b>	<b>Description</b>
Strike PhantomNet_0fbc2bf2	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is 0fbc2bf2f66fc72c521a9b8561bab1da.
Strike PhantomNet_1498f1df	This strike sends a malware sample known as PhantomNet. PhantomNet is a malware of the backdoor type that provides a persistent presence on the targeted network. It is delivered through spear-phishing emails that direct users to malicious webpages designed to mimic legitimate ones, where an exploitation framework attempts to compromise visitors' browsers. The first-stage payload, Voxel, persistent on the system and maintains communication with a remote server controlled by the attacker. Its key capabilities include exfiltrating data, downloading and executing secondary payloads, and performing man-in-the-middle attacks. The MD5 hash of this PhantomNet sample is f21b63ddd7d2a773eb21a065015cdd01.
Strike Phoenix Cryptolocker_d86f451b	This strike sends a malware sample known as Phoenix Cryptolocker. Phoenix Cryptolocker is a ransomware that made headlines when it was detected in an attack against CNA Financial. The malware is able to infiltrate by appearing to be a legitimate utility and coming signed with a digital certificate. After infection and file encryption, the malware deletes all traces of itself leaving behind only the ransom note with instructions for the victim. The MD5 hash of this Phoenix Cryptolocker sample is d86f451bbff804e59a549f9fb33d6e3f.
Strike PixPirate_5948461c	This strike sends a polymorphic malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.turnip.index' is the package name of the malware sample. Constant strings in the code have been encrypted. The MD5 hash of this malware sample is 5948461cacbeb2543f52ac0a08161884.
Strike PixPirate_7d55da5e	This strike sends a polymorphic malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.turnip.index' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 7d55da5e52fbad590a0b472dabf57455.
Strike PixPirate_91b14bf2	This strike sends a polymorphic malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.simplicity.transformer' is the package name of the malware sample. Constant strings in the code have been encrypted. The MD5 hash of this malware sample is 91b14bf2b8c4a588fdf7f37e6c79b3fd.

<b>Name</b>	<b>Description</b>
Strike PixPirate_921c1955	This strike sends a polymorphic malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.simplicity.transformer' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 921c1955f79bc3c69db8c61147226de2.
Strike PixPirate_93a2b43f	This strike sends a malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.simplicity.transformer' is the package name of the malware sample. The MD5 hash of this malware sample is 93a2b43f862013f8c50393443ec6497a.
Strike PixPirate_c382d8e5	This strike sends a malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.turnip.index' is the package name of the malware sample. The MD5 hash of this malware sample is c382d8e5f2aaa033521a9310d23461c7.
Strike PixPirate_e12030f6	This strike sends a polymorphic malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.simplicity.transformer' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is e12030f67003a7009d51bd0e86f6f6c7.
Strike PixPirate_e334ad17	This strike sends a polymorphic malware sample known as PixPirate. PixPirate is an Android banking Trojan designed to carry out Automatic Transfer System (ATS) attacks, primarily targeting Brazilian banks using the Pix Instant Payment platform. It intercepts and deletes SMS messages, prevents uninstallation, and conducts malvertising campaigns. Using Accessibility Services, PixPirate steals banking passwords, tailoring its approach to each targeted bank's application layout. 'com.turnip.index' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is e334ad176c31e74c66dca3e1099da574.

<b>Name</b>	<b>Description</b>
Strike PteroLNK_17292f18	<p>This strike sends a malware sample known as PteroLNK. This strike sends a malware sample known as PteroLNK. PteroLNK is a VBScript-based loader used in cyberespionage campaigns attributed to the Russian-linked Gamaredon threat group. It is delivered through obfuscated scripts that deploy additional components, including a downloader and an LNK dropper. The downloader retrieves command and control infrastructure via Dead Drop Resolvers hosted on services like Telegraph and Teletype, while the LNK dropper creates malicious shortcuts across local and network drives to trigger payload execution. The malware achieves persistence through scheduled tasks, uses obfuscation and environment checks to evade detection, and communicates with its C2 using Cloudflare tunnels and machine-specific User-Agent headers. The MD5 hash of this PteroLNK sample is 17292f18012dbb863e9945fc434e6e48.</p>
Strike PteroLNK_405e482f	<p>This strike sends a malware sample known as PteroLNK. This strike sends a malware sample known as PteroLNK. The MD5 hash of this PyXie RAT sample is 5d2fd364769d12d26c83922e5e31e48e.
Strike PyXie RAT_837dda01	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is 837dda0135b0aa7628874b451c66b50f.
Strike PyXie RAT_9d3e1289	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is 9d3e12893fae7eb6c33682b5bbea6d93.
Strike PyXie RAT_a07761d3	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is a07761d3be0749c5ba7da3d8222f1d86.

<b>Name</b>	<b>Description</b>
Strike PyXie RAT_a7da1675	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is a7da167512ae0077122e349e1cf54085.
Strike PyXie RAT_aa03fbdd	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is aa03fbbd932b6f57d26c53cf7a01ef1b.
Strike PyXie RAT_aa64323c	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is aa64323c466ac0ae62ec6532bac30936.
Strike PyXie RAT_cf1ad0f6	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is cf1ad0f6c0f7dfe7b5940008ed27bc28.
Strike PyXie RAT_d76837f8	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is d76837f88a8d62351e2d551be2fe9893.
Strike PyXie RAT_f198217b	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is f198217bafc00828a2f5bc7f816c8e1d.
Strike PyXie RAT_fa8a1311	This strike sends a malware sample known as PyXie RAT. PyXie is a Python Remote Access Trojan. It has been seen in the wild since 2018, and is typically seen in conjunction with Cobalt Strike beacons. PyXie has been used to deliver ransomware attacks to the healthcare and education industries. The MD5 hash of this PyXie RAT sample is fa8a1311b6488e40de471cc183ce50eb.
Strike PylangGhost_02476bc3	This strike sends a malware sample known as PylangGhost. This strike sends a malware sample known as PylangGhost. PylangGhost is a Python-based remote access trojan (RAT) and a variant of the GolangGhost malware, linked to the North Korean-aligned threat actor Famous Chollima. It is distributed through phishing campaigns that impersonate job interview processes, tricking victims into executing a malicious ClickFix utility. Once launched on Windows systems, the malware establishes persistence via registry modifications and connects to a C2 server using RC4-encrypted HTTP communication. It enables attackers to execute remote shell commands, transfer files, and steal data, including credentials and browser extension information from over 80 wallet and password managers such as MetaMask and 1 Password. The MD5 hash of this PylangGhost sample is 02476bc333be305bd0f5791d389755cd.

<b>Name</b>	<b>Description</b>

Strike Qakbot_a3d6462c	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is a3d6462cdc162149e22502c694a7427c.

<b>Name</b>	<b>Description</b>
Strike Qakbot_a683a2f7	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is a683a2f746b192a4a2dd8e8fa683c714.
Strike Qakbot_a6a519b1	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is a6a519b1a8f2fc8372378513fbe3096f.
Strike Qakbot_a896b96a	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is a896b96a31d0ece9e401e1d77b7d6567.
Strike Qakbot_aaf9db74	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is aaf9db74093b270f8742864361ba3a45.
Strike Qakbot_aea860a2	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is aea860a2c9b5de2e6a9619affef59ab6.
Strike Qakbot_b0ffde08	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is b0ffde08f15d2543caf52fc8863efbca.
Strike Qakbot_b2f82fff	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is b2f82fffaf5edbbc741cc7423c54a204.
Strike Qakbot_b4675efb	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is b4675efb7af833494f30356b6d8e6578.
Strike Qakbot_b6f8b13c	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is b6f8b13c020450d5218ed523754b1b56.

<b>Name</b>	<b>Description</b>
Strike Qakbot_b6fe7585	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is b6fe75856f1a56f07ce15fd332c41e6e.
Strike Qakbot_b78d07e0	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is b78d07e05cd8716afc4c929b8b810033.
Strike Qakbot_ba811d0b	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is ba811d0b025160b8c7766be010784dca.
Strike Qakbot_bb30456f	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is bb30456f5d7fc93307e9e82061fe0f8b.
Strike Qakbot_bd56adc8	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is bd56adc8c75c6973351981b24f1be32d.
Strike Qakbot_bf043150	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is bf043150b6bd4a1dadffda1b1a18d8eb.
Strike Qakbot_c1a91d62	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c1a91d62c48fb71cbebda4011e6ae38.
Strike Qakbot_c2854d54	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c2854d54350aeeaa8ff69da1435832ed.
Strike Qakbot_c31c0436	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c31c0436a53ccc0d10da3f42a3605451.

<b>Name</b>	<b>Description</b>
Strike Qakbot_c378ead9	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c378ead9fe62c17f0124b12246d9057b.
Strike Qakbot_c5353783	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c5353783f4e722c9cdc065107a47e62f.
Strike Qakbot_c579791b	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c579791b7d102d18967aa4bf05f28281.
Strike Qakbot_c611fb97	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c611fb978592e9b1357244627049350d.
Strike Qakbot_c6404685	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c640468581a747f755c21a044bd30f77.
Strike Qakbot_c7d27858	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is c7d27858519a1edad84d9560693b5b36.
Strike Qakbot_cd76cab9	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is cd76cab9e70999010d4549f660024bfe.
Strike Qakbot_cf2bc340	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is cf2bc34058f6e9684f0851a5fb0b59c7.
Strike Qakbot_cfd78095	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is cfd7809538b65db8f8d3fdbd645b93e03.

<b>Name</b>	<b>Description</b>
Strike Qakbot_d1ac9de4	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is d1ac9de4eee4cf5ca78ef82cac24190a.
Strike Qakbot_d2715637	This strike sends a polymorphic malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Qakbot sample is d2715637f4f9a631de611b64fa57ca82.
Strike Qakbot_d647b7bb	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is d647b7bb5d864949249f51d1a7927b47.
Strike Qakbot_d7d6b087	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is d7d6b087e5fb0450a0fb8c747850489.
Strike Qakbot_d8053079	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. Qbot primarily targets sensitive information like banking credentials but can also steal FTP credentials and spread across a network using SMB. The MD5 hash of this Qakbot sample is d80530792140cbc13f6d21021e6c195.
Strike Qakbot_d867d6d9	This strike sends a malware sample known as Qakbot. Qakbot, aka Qbot, has been around for since at least 2008. <b>Name</b>	<b>Description</b>
Strike Qilin_0f73b467	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is 0f73b467ff03f9224c024f4eb3aecedb.
Strike Qilin_1c0cb55d	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. It is usually delivered via spear-phishing emails or waterhole attacks, and is often seen in combination with the PlugX and Quasar RATs. Once executed, Qilin creates a backdoor into the infected system, allowing for further exploitation. Its key capabilities include launching additional payloads, achieving persistence, and performing reconnaissance on the infected system. The MD5 hash of this Qilin sample is 1c0cb55d3a8d544ab0bd7d81d2985089.
Strike Qilin_227f14f4	This strike sends a malware sample known as Qilin. Qilin is a malware that is used in conjunction with other malicious software to carry out targeted attacks. Strike QuirkyLoader_10e8d5ac	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. It uses a unique method of infection by embedding the malware into a .png file which is then delivered via phishing emails. Once the user opens the email and downloads the .png file, the malware is executed and starts deploying the payload. Its key capabilities include evasion of detection systems, downloading and executing additional payloads, and establishing persistent access to the infected system. The MD5 hash of this QuirkyLoader sample is 10e8d5ac2618249893621ed0a41352cc.
Strike QuirkyLoader_1b636f0a	This strike sends a malware sample known as QuirkyLoader. QuirkyLoader is a malware loader that delivers and deploys ransomware or other types of malware onto the victim computer. Strike Quishing_f733bc05	This strike sends a malware sample known as Quishing. Quishing or QR Code Phishing is a type of attack in which the attacker embeds the malicious URL inside a QR code. This sample is a pdf that contains a malicious QR code that uses social engineering to lure the victim to clicking malicious URLs. The MD5 hash of this Quishing sample is f733bc057c7026ef4ce5c6c2dd897194.

<b>Name</b>	<b>Description</b>
Strike Quishing_fa70f294	This strike sends a malware sample known as Quishing. Quishing or QR Code Phishing is a type of attack in which the attacker embeds the malicious URL inside a QR code. This sample is a pdf that contains a malicious QR code that uses social engineering to lure the victim to clicking malicious URLs. The MD5 hash of this Quishing sample is fa70f2949303fe442f3af01fda8ee624.
Strike QuiteRAT_0a2f5b41	This strike sends a polymorphic malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The binary has random bytes appended at the end of the file. The MD5 hash of this QuiteRAT sample is 0a2f5b41bfad0e649fde2a6a30f6a264.
Strike QuiteRAT_365a5012	This strike sends a polymorphic malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The binary has the timestamp field updated in the PE file header. The MD5 hash of this QuiteRAT sample is 365a50124e97acf2c758d7271bd2a046.
Strike QuiteRAT_3d5747d4	This strike sends a polymorphic malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The binary has been packed using upx packer, with the default options. The MD5 hash of this QuiteRAT sample is 3d5747d4d5f363c986afc291c42d62cf.
Strike QuiteRAT_c027d641	This strike sends a malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The MD5 hash of this QuiteRAT sample is c027d641c4c1e9d9ad048cda2af85db6.
Strike QuiteRAT_e969de0f	This strike sends a polymorphic malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this QuiteRAT sample is e969de0f656aed04259e4dc2a22bf55c.
Strike QuiteRAT_ec455ea2	This strike sends a polymorphic malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this QuiteRAT sample is ec455ea262331e229dacf88e5c36621b.
Strike QuiteRAT_f4e35caa	This strike sends a polymorphic malware sample known as QuiteRAT. QuiteRAT is composed of Qt libraries. It is believed to belong to the MagicRAT family and although made up of Qt does not have a GUI. QuiteRAT has been detected in a campaign utilizing CVE-2022-47966 to deploy the RAT. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this QuiteRAT sample is f4e35caab7658979002190faa27d009e.

<b>Name</b>	<b>Description</b>
Strike REvil_18786bfa	This strike sends a malware sample known as REvil. In July of 2021 a supply chain ransomware attack leveraging an SQL injection vulnerability in Kaseya VSA software was carried out against multiple MSPs and their customers. The ransomware being used in this attack, REvil also known as Sodinokibi, was pushed via an automated malicious update to their customers. The MD5 hash of this REvil sample is 18786bfac1be0ddf23ff94c029ca4d63.
Strike REvil_1a0545bb	This strike sends a polymorphic malware sample known as REvil. REvil malware also known as Sodinokibi operates as a ransomware-as-a-service (RaaS), that has recently been seen targeting law firms of A-list celebrities. The attackers not only pose the threat of losing all encrypted data but of also leaking stolen client data to the public. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this REvil sample is 1a0545bbcac7a44a1406cdac135288ca.
Strike REvil_2019e63a	This strike sends a polymorphic malware sample known as REvil. REvil malware also known as Sodinokibi operates as a ransomware-as-a-service (RaaS), that has recently been seen targeting law firms of A-list celebrities. The attackers not only pose the threat of losing all encrypted data but of also leaking stolen client data to the public. The binary has been packed using upx packer, with the default options. The MD5 hash of this REvil sample is 2019e63a90b551b369bf42ede3827002.
Strike REvil_2075566e	This strike sends a malware sample known as REvil. REvil malware also known as Sodinokibi is a ransomware that has recently been seen targeting law firms of A-list celebrities. The attackers not only pose the threat of losing all encrypted data but of also leaking stolen client data to the public. The MD5 hash of this REvil sample is 2075566e7855679d66705741dabe82b4.
Strike REvil_2c7ae560	This strike sends a polymorphic malware sample known as REvil. REvil malware also known as Sodinokibi is a ransomware that has recently been seen targeting law firms of A-list celebrities. The attackers not only pose the threat of losing all encrypted data but of also leaking stolen client data to the public. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this REvil sample is 2c7ae560e8df6f5c6d698edc2c860e83.
Strike REvil_31c17b36	This strike sends a polymorphic malware sample known as REvil. REvil malware also known as Sodinokibi is a ransomware that has recently been seen targeting law firms of A-list celebrities. The attackers not only pose the threat of losing all encrypted data but of also leaking stolen client data to the public. The binary has been packed using upx packer, with the default options. The MD5 hash of this REvil sample is 31c17b36a1392448458c41447c040639.
Strike REvil_3777f3e0	This strike sends a malware sample known as REvil. REvil malware also known as Sodinokibi operates as a ransomware-as-a-service (RaaS), that has recently been seen targeting law firms of A-list celebrities. The attackers not only pose the threat of losing all encrypted data but of also leaking stolen client data to the public. The MD5 hash of this REvil sample is 3777f3e092f2208c6670c01816562a7d.

Strike Ramnit_f457f41a	This strike sends a malware sample known as Ramnit. Ramnit is a banking trojan that has been around since 2010 and has recently been resuming activity. After infection, it scans files that have interesting keywords, such as "wallet", "passwords", or the names of the targeted banks. Ramnit uses malvertising and malware-laden spam for distribution, though it also employed popular exploit kits, such as Angler. The MD5 hash of this Ramnit sample is f457f41a6bd5a0a1e4608c8a097d6a43.
Strike Ramnit_f8224fd6	This strike sends a malware sample known as Ramnit. Ramnit is a banking trojan that has been around since 2010 and has recently been resuming activity. After infection, it scans files that have interesting keywords, such as "wallet", "passwords", or the names of the targeted banks. Ramnit uses malvertising and malware-laden spam for distribution, though it also employed popular exploit kits, such as Angler. The MD5 hash of this Ramnit sample is f8224fd6a29b1ca1258840c26cddaab3.
Strike Ramnit_f874de55	This strike sends a malware sample known as Ramnit. Ramnit is a banking trojan that has been around since 2010 and has recently been resuming activity. After infection, it scans files that have interesting keywords, such as "wallet", "passwords", or the names of the targeted banks. Ramnit uses malvertising and malware-laden spam for distribution, though it also employed popular exploit kits, such as Angler. The MD5 hash of this Ramnit sample is f874de5541c3e154c13c0c9a5fe9797d.
Strike Ramnit_fc3a1beb	This strike sends a malware sample known as Ramnit. Ramnit is a banking trojan that has been around since 2010 and has recently been resuming activity. After infection, it scans files that have interesting keywords, such as "wallet", "passwords", or the names of the targeted banks. Ramnit uses malvertising and malware-laden spam for distribution, though it also employed popular exploit kits, such as Angler. The MD5 hash of this Ramnit sample is fc3a1beb19c6cd9bce76ea8120589519.
Strike Ramnit_feb53bd5	This strike sends a malware sample known as Ramnit. Ramnit is a banking trojan that has been around since 2010 and has recently been resuming activity. After infection, it scans files that have interesting keywords, such as wallet, passwords or the names of the targeted banks. Ramnit uses malvertising and malware-laden spam for distribution, though it also employed popular exploit kits, such as Angler. The MD5 hash of this Ramnit sample is feb53bd59761634c646bc71f060b22b0.
Strike Ramnit_ff850214	This strike sends a malware sample known as Ramnit. Ramnit is a banking trojan that has been around since 2010 and has recently been resuming activity. After infection, it scans files that have interesting keywords, such as "wallet", "passwords", or the names of the targeted banks. Ramnit uses malvertising and malware-laden spam for distribution, though it also employed popular exploit kits, such as Angler. The MD5 hash of this Ramnit sample is ff8502146514a7a68a0cf0e62c72feb.

<b>Name</b>	<b>Description</b>
Strike RapperBot_1318afe2	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 1318afe218cf3a86f71aa6936df33ee7.
Strike RapperBot_1bdfcca7	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 1bdfcca7b35ad31a41fba5d6dc88b276.
Strike RapperBot_2e974038	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 2e9740382e75ebb7c8f4a0cdf2c36500.
Strike RapperBot_30ce66fa	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 30ce66fa45abddf278dbb3eccf87ddad.
Strike RapperBot_46da0686	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 46da0686e0ad65ee44f4cac5f6558ec9.

<b>Name</b>	<b>Description</b>
Strike RapperBot_5630ee34	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 5630ee34393ce22d317c3a11a91b5bb2.
Strike RapperBot_5a2fe024	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 5a2fe024029c7b8894885ded5f08e42e.
Strike RapperBot_5ab947f7	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 5ab947f7cae22fa65398c591e1aed268.
Strike RapperBot_5d7d2618	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 5d7d2618e09ea3c84f5a484553e0ea65.
Strike RapperBot_5e10e46c	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 5e10e46cccd75627df169976de506029d.

<b>Name</b>	<b>Description</b>
Strike RapperBot_64e0ddc2	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 64e0ddc2aa51350b355434ffd1a4d6b6.
Strike RapperBot_669a8e06	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 669a8e0683154f594a110d129d96a068.
Strike RapperBot_6faeac8f	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 6faeac8f2269c3d86606b34de90607fd.
Strike RapperBot_72c70d37	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 72c70d37a714ecf026cdea998c36a069.
Strike RapperBot_75181839	This strike sends a malware sample known as RapperBot. RapperBot is an IoT botnet malware that heavily borrows from Mirai source code. However, unlike Mirai, RapperBot brute forces vulnerable SSH servers. Upon successfully breaking into the SSH server, the credentials are sent back to the command-and-control server, and then the malware adds its public key to the authorized keys file in an attempt to maintain persistence on the machine. This primes the malware for future DDoS attacks on the target when the attackers are ready. The MD5 hash of this RapperBot sample is 75181839d4eca01c095f5976cfe06f71.

This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 53ad5cd4141a2ac1b9ac77e5b0f28eef.
Strike Razy_5d25dc38	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 5d25dc38a80f4a2bf96e40fc912c683a.
Strike Razy_5d412f49	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 5d412f493bf3599382b93dae9d321197.

<b>Name</b>	<b>Description</b>
Strike Razy_614a7da1	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 614a7da1251aea20e234b2024fd082f6.
Strike Razy_6e668a86	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 6e668a860579dbd302a187a98076b93a.
Strike Razy_77b5096d	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 77b5096d8ae7e182bf8a36d2349a64e0.
Strike Razy_77d8eca1	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 77d8eca1b5391ceb71c3317a5e6b6118.
Strike Razy_7b0ebe83	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 7b0ebe8345df9f422d2401fcc8e17832.
Strike Razy_7bdfb61d	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 7bdfb61dfb48061bb799543090f8bb54.
Strike Razy_7ee9e970	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 7ee9e9701b2c5d1b0345eea51fe0f564.
Strike Razy_8115eaff	This strike sends a polymorphic malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Razy sample is 8115eafffd3dc5616b473a855a1462a7.
Strike Razy_844d99c7	This strike sends a polymorphic malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The binary has random bytes appended at the end of the file. The MD5 hash of this Razy sample is 844d99c7d6902f04c4f2c834cc2d356b.
Strike Razy_89731bbf	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 89731bbf0ff24e5ab793221aa5fa793d.

<b>Name</b>	<b>Description</b>
Strike Razy_8d261a3f	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 8d261a3fbccb88a55798ceb0d95c558.
Strike Razy_8e765624	This strike sends a polymorphic malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Razy sample is 8e765624f020df424a152dab988a9723.
Strike Razy_967d450c	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 967d450cda75fadcb84009f55723311d0.
Strike Razy_9b6a7a52	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 9b6a7a5208bbb45777920653c8b23855.
Strike Razy_9bfd7e8	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 9bfd7e8a74bf91ea9d1a30d3f00e7aa.
Strike Razy_9ef22e9c	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is 9ef22e9c85adf31eff472e50319aa8bd.
Strike Razy_af9a9a77	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is af9a9a779a445b6ce83ff48adb53611d.
Strike Razy_b1d1bedb	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is b1d1bedb59a544bfa5beba3067560a1b.
Strike Razy_b42a8425	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is b42a842553913cbac45effdc053e9696.
Strike Razy_b99915c7	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is b99915c7b410a6460dd0f1e0281ee0be.

<b>Name</b>	<b>Description</b>
Strike Razy_b9a11c5d	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is b9a11c5d2dc977651fc892b50a18cc2d.
Strike Razy_b9bde5f9	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is b9bde5f9ae8e82d14e7e2edab02885a6.
Strike Razy_bb99864d	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is bb99864d4aef505915898a5b42db891b.
Strike Razy_bc68cf1c	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is bc68cf1cb8bc229686ef89a93b6a12fa.
Strike Razy_c9f10d7c	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is c9f10d7c9f46eacb6dce566f889fa8b1.
Strike Razy_cae50e27	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is cae50e27b70d5bab0e7b7ee5ddbaae89.
Strike Razy_d1438e27	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is d1438e27f636d45aa5ad7fd64ca3a340.
Strike Razy_dd965327	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is dd965327fe9900628f84aabaf4ee34e.
Strike Razy_e609a6c2	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is e609a6c2c348dc5e0ca3b7b4d62b6883.
Strike Razy_e8040f28	This strike sends a malware sample known as Razy. Razy is often used as a generic detection name for a Windows Trojan. This cluster of samples contains encrypted code in the resources section that could be injected to a legitimate process. The MD5 hash of this Razy sample is e8040f28bb69b4253d3b26b058a9f8ce.

<b>Name</b>	<b>Description</b>
Strike RemcosRAT_085d3471	This strike sends a malware sample known as RemcosRAT. RemcosRAT is a malware that infiltrates systems through webhards in South Korea. It initially disguised as a legitimate remote administration tool, has transformed into a potent weapon for unauthorized remote control and data exfiltration. Threat actors lure users with seemingly harmless content, like adult games, containing a malicious VBS file. Upon execution, the VBS file connects to a remote service, initiating RemcosRAT download. Once installed, the malware compromises the user's system, granting remote access. It can tap into cameras and microphones, posing a serious privacy threat. The MD5 hash of this RemcosRAT sample is 085d3471e880c5f53fd98df14ccc23e7.
Strike RemcosRAT_0adde8b5	This strike sends a malware sample known as RemcosRAT. RemcosRAT is a malware that infiltrates systems through webhards in South Korea. Strike Remcos_d5bf288b	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is d5bf288bbdf4afba177785a1511f1856.
Strike Remcos_d83dc6e6	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is d83dc6e6c5760a053e59307f5a69f6d8.
Strike Remcos_de67536a	This strike sends a polymorphic malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Remcos sample is de67536a7c57c981c32c16529560eb6b.

<b>Name</b>	<b>Description</b>
Strike Remcos_e3eb514a	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is e3eb514abb6b01dac51031b00c9426b8.
Strike Remcos_e6423276	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is e6423276771b55ea6c6fe28880a9a31d.
Strike Remcos_e6c802e9	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is e6c802e9f43228c9a1046c6060334d95.
Strike Remcos_e8ded79a	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is e8ded79af9b2b51bce510aeced4bef18.
Strike Remcos_e9564e92	This strike sends a polymorphic malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The binary has been packed using upx packer, with the default options. The MD5 hash of this Remcos sample is e9564e9206c1d3172dec7f0100e4ea5f.
Strike Remcos_ea590f4a	This strike sends a polymorphic malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Remcos sample is ea590f4aece0afd09719e690201e73c2.
Strike Remcos_ecee832e	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is eccee832e996ffefdbb4cf87cee4ed906.
Strike Remcos_ed06f450	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is ed06f450120f6c02cb4e0518223686b7.
Strike Remcos_eeb78134	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is eeb78134f1bedb33f26d26059d5de140.

Strike Remcos_f64bc692	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is f64bc6923c8051b1cb7e9126c4725bf1.
Strike Remcos_f678dcff	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is f678dcff5c1bd21ee75c90faaa852bbd.
Strike Remcos_fba106ad	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is fba106ad4a1e85d868858350f0aa8574.
Strike Remcos_fbcad086	This strike sends a malware sample known as Remcos. Remcos is a RAT that logs keystrokes, and performs other interactions with the host like capturing screenshots. It is typically delivered via documents with macros in phishing emails. The MD5 hash of this Remcos sample is fbcd086e0b20b839ce4f29362624146.
Strike RevengeRAT_057203a5	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has the debug flag removed in the PE file format. The MD5 hash of this RevengeRAT sample is 057203a509074d89e126e35f42312d4b.
Strike RevengeRAT_0f01bb00	This strike sends a malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The MD5 hash of this RevengeRAT sample is 0f01bb00e77961cc09654252c4e36d2d.
Strike RevengeRAT_258cc018	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has been packed using upx packer, with the default options. The MD5 hash of this RevengeRAT sample is 258cc01818963e63732b831e3f3dad48.
Strike RevengeRAT_2e733b70	This strike sends a malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The MD5 hash of this RevengeRAT sample is 2e733b705772af545754a2440ba389ce.
Strike RevengeRAT_3a55316d	This strike sends a malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The MD5 hash of this RevengeRAT sample is 3a55316dc3fd3a6a2c0cee0a5a6f1dbe.

<b>Name</b>	<b>Description</b>
Strike RevengeRAT_43284076	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this RevengeRAT sample is 432840760b2cf2fe3ef45abcfcef07bc.
Strike RevengeRAT_44d87bf5	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has random bytes appended at the end of the file. The MD5 hash of this RevengeRAT sample is 44d87bf5878aa4257c5c2c6af15bb8db.
Strike RevengeRAT_4ba21ad1	This strike sends a malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The MD5 hash of this RevengeRAT sample is 4ba21ad15a2c38126ba154f8078d2131.
Strike RevengeRAT_4e5e0003	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this RevengeRAT sample is 4e5e00034ec3a51d8d731ace8e04dd2e.
Strike RevengeRAT_510b5279	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has the timestamp field updated in the PE file header. The MD5 hash of this RevengeRAT sample is 510b52794a54b51b72198cc7a0eb89d6.
Strike RevengeRAT_5a665a69	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has the timestamp field updated in the PE file header. The MD5 hash of this RevengeRAT sample is 5a665a69e8f3180ac2c04ec271c87271.
Strike RevengeRAT_6068ec4e	This strike sends a malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The MD5 hash of this RevengeRAT sample is 6068ec4eb917651127c8dcc9d090b7e8.
Strike RevengeRAT_61384796	This strike sends a polymorphic malware sample known as RevengeRAT. This sample is a Remote Access Tool that allows for the attacker to perform a variety of malicious covert functions on the target system. Some of these capabilities include but are not limited to, spying on the user, and ex-filtrating data. The binary has been packed using upx packer, with the default options. The MD5 hash of this RevengeRAT sample is 61384796b20744038ffee8c26dde1c4e.

The MD5 hash of this RoamingMouse sample is 14369bdc5db99e074e7c46c534fd4ff4.

<b>Name</b>	<b>Description</b>
Strike RoamingMouse_1450f053	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 1450f0538fd02131b8c1965a7dfa562c.
Strike RoamingMouse_306504ab	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 306504ab7aa2eaee1a5a6bb29c698e70.
Strike RoamingMouse_316e987d	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 316e987dc5ea77113e288db3fb3e9f6.
Strike RoamingMouse_36bccf5b	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 36bccf5b8a86dd273edd936e2c56e942.
Strike RoamingMouse_3de5e596	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 3de5e5969683d69dfd970ec6b64f7421.

<b>Name</b>	<b>Description</b>
Strike RoamingMouse_41ac3590	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 41ac35900ca114695acb03d9639fd946.
Strike RoamingMouse_4ae5a008	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 4ae5a0088ae29edc09eb4c37c404622c.
Strike RoamingMouse_4ecc6467	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 4ecc6467a725d7bef6264ef5ca307a07.
Strike RoamingMouse_51face5b	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 51face5b20d783d384c479d1e975b0d1.
Strike RoamingMouse_63b84843	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 63b84843bf2832538b750313f66f97f4.

<b>Name</b>	<b>Description</b>
Strike RoamingMouse_63ea221b	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 63ea221bdb8e1d125e2eb199b053f56e.
Strike RoamingMouse_6bb0a90d	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 6bb0a90d607bd94bae417b45a3ea078.
Strike RoamingMouse_713627d0	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 713627d04dc027cbeeab77c3b128e5a9.
Strike RoamingMouse_7be8712c	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 7be8712c3f5646f2be68ed778a27e83b.
Strike RoamingMouse_7f90e779	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 7f90e7798f13bd496c9c4ffe9b33bbd5.

<b>Name</b>	<b>Description</b>
Strike RoamingMouse_96fa615e	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is 96fa615e523d689bff1449de9a4c5d28.
Strike RoamingMouse_d462fb86	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is d462fb86f928005214c7368d726d8472.
Strike RoamingMouse_d5ea3247	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is d5ea3247d0452965cad84fa1fc9f1e1a.
Strike RoamingMouse_e1c4fbe1	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is e1c4fbe183620334932ae8dffabfd7d.
Strike RoamingMouse_e6396a5f	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. The MD5 hash of this RoamingMouse sample is e6396a5fe95fccabe5bf4ea30bc14d92.

<b>Name</b>	<b>Description</b>
Strike RoamingMouse_e795ac19	This strike sends a malware sample known as RoamingMouse. RoamingMouse is a macro enabled dropper that drops various malicious components. These variants were seen in Excel files and are triggered via mouse click events. In the case of the Earth Kasha 2025 campaign the malicious components roamingmouse drops are legitimate signed applications and dlls from JustSystems Inc, as well as a malicious ANELLDR loader and encrypted ANEL payload. Once the user clicks the macro and execution of roamingmouse begins, the legitimate dropped .exe is launched from explorer.exe and then side loads the malicious dll in the same directory. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 9589482ad6c81182968a9fcba0f7ceed.
Strike SDK_963e8b9f	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 963e8b9f4400e7ad7f73cdd14b5f1b87.
Strike SDK_9967784e	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is 9967784e01447928148ac24d7e4c8f3d.
Strike SDK_a4027650	This strike sends a malware sample known as SDK. The malware described is a Software Development Kit (SDK) that is used to sell bandwidth. It does this by embedding itself in popular apps and then running in the background to sell the user's bandwidth without their knowledge. Once installed, it uses the device's Internet connection to run various tasks, including DDoS attacks, serving pirated content, or even Bitcoin mining. Its key capabilities include running in the background without the user's knowledge, selling bandwidth, and performing various tasks for the attacker. The MD5 hash of this SDK sample is a40276505836397427fc37e979a1f353.

Besides being heavily obfuscated, much of its C2 communication is encrypted. The MD5 hash of this SambaSpy sample is e4811f317e4df202229847834512a453.
Strike Scar_01abda83	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 01abda83c026ff0fe5dedd293b9c12cb.
Strike Scar_0274c84c	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 0274c84cd3e88e0f60f8843f56b3a632.
Strike Scar_09b3dde0	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 09b3dde0483c4d3d61b29c4c9622fea6.
Strike Scar_0c6c38f7	This strike sends a polymorphic malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Scar sample is 0c6c38f795d373fc8f5fc07f908903c4.
Strike Scar_0f32fa41	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 0f32fa41e160bdb3ad0ce83daad79f75.
Strike Scar_1951faf5	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 1951faf55309f61702bcda986e5229bf.
Strike Scar_1ecbcd7c	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 1ecbcd7cb132b302d1987d6354639341.
Strike Scar_2008fa22	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 2008fa2210a7123f228d83616b5b206b.
Strike Scar_2033f6b7	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 2033f6b72b573bae14191c702d12bfab.
Strike Scar_20a3ed89	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 20a3ed89cdf16707930a21217f912b97.

<b>Name</b>	<b>Description</b>
Strike Scar_220ef7f4	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 220ef7f41f700600d04c3a8b64964900.
Strike Scar_27161106	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 271611065a218801f7869636ec844402.
Strike Scar_30a527e1	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 30a527e1edc2815eafc93d038c755f3d.
Strike Scar_3171bbe3	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 3171bbe396ea5bec0d85042f7e891677.
Strike Scar_33454c7f	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 33454c7f55343c4200bbf4f7b7fc767e.
Strike Scar_35ab4641	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 35ab4641aa1904672a8b211ffcc45d4e.
Strike Scar_36a91fe4	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 36a91fe472d4ddff1c296a3e798deed.
Strike Scar_3786118b	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 3786118bba547421d900ad3c1136fabc.
Strike Scar_4139d679	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 4139d6792f8a47e5d9e0fe1b434cadb5.
Strike Scar_4d3e4ff9	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 4d3e4ff9f638ab8e9b6a23c372c107b6.
Strike Scar_50e9db8d	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 50e9db8d9efe0597e7b8d9cbaa6d79c7.
Strike Scar_50ef4e47	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 50ef4e475ee9ccf98e596a606d9d32e4.

<b>Name</b>	<b>Description</b>
Strike Scar_55932750	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 5593275031b345882d5e64aa7c9bb728.
Strike Scar_628f4334	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 628f4334ccffc5726199ac0cdf0d31d1.
Strike Scar_6664c718	This strike sends a polymorphic malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Scar sample is 6664c718d5bb1dc98f97a91013a9f017.
Strike Scar_67bbf0d5	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 67bbf0d5bb33948dcfde61bf415fdb8c.
Strike Scar_6b1d7e40	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 6b1d7e4042b9a77daa058ae57dd4702a.
Strike Scar_7e089601	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 7e089601c83340ebdbaaef2a9d4ebb45.
Strike Scar_8628f5f1	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 8628f5f1d6593915cf23b60c46377cc1.
Strike Scar_874499a9	This strike sends a polymorphic malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The binary has been packed using upx packer, with the default options. The MD5 hash of this Scar sample is 874499a974acb34d4827b6e1a91143d6.
Strike Scar_8c15f415	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 8c15f415f158443db22461bb7b4dc62e.
Strike Scar_91eb29c6	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 91eb29c6e9c065a0259b936101739b90.
Strike Scar_9adb6b64	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is 9adb6b64a3edeba039c4f45bee5bef.

<b>Name</b>	<b>Description</b>

Strike Scar_e9bd79bb	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is e9bd79bb61fc7ac4f4ff2dea03751bc1.
Strike Scar_ebaed22b	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is ebaed22b81e90153fc2ad70098604ae2.
Strike Scar_f740c3dd	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is f740c3dd1532b687d451dcc4f63ecfd3.
Strike Scar_f8396a17	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is f8396a17869a29e9f125e8459327d954.
Strike Scar_f90256f5	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is f90256f556b2743291103bbaa4f66302.
Strike Scar_ff9bd65f	This strike sends a malware sample known as Scar. Scar is a worm and will download files while also trying to spread to other machines by copying itself to removable media. The MD5 hash of this Scar sample is ff9bd65f29492a559e2f630afbe9accd.
Strike Sekhmet_1343bd0e	This strike sends a malware sample known as Sekhmet. The Sekhmet ransomware was used in an attack against gas handling company SilPac in June 2020. This ransomware has been commonly spread via spam email. Once it encrypts the files on the targeted system it leaves behind a RECOVER-FILES.txt file that includes a ransom note with instructions on how to pay via TOR. The MD5 hash of this Sekhmet sample is 1343bd0e55191ff224f2a5d4b30cdf3b.
Strike Sekhmet_b7ad5f7e	This strike sends a malware sample known as Sekhmet. The Sekhmet ransomware was used in an attack against gas handling company SilPac in June 2020. This ransomware has been commonly spread via spam email. Once it encrypts the files on the targeted system it leaves behind a RECOVER-FILES.txt file that includes a ransom note with instructions on how to pay via TOR. The MD5 hash of this Sekhmet sample is b7ad5f7ec71dc812b4771950671b192a.
Strike Shikitega_04ad59ff	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 04ad59ff2b2b8461a6d990af16bc5ca7.

<b>Name</b>	<b>Description</b>
Strike Shikitega_0f1f2d4a	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 0f1f2d4a6fc26df7cf5d5a8c65ac8578.
Strike Shikitega_2f56a330	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 2f56a330fb253a1520e00668c6f94e47.
Strike Shikitega_557bdc56	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 557bdc5602b301d5584a34b27328b019.
Strike Shikitega_6b13e69c	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 6b13e69cc37757b1f2dbc2a1c8f806f1.
Strike Shikitega_6e684589	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 6e6845896222ee7d48e76ea2bf11b97d.
Strike Shikitega_7a34ca9c	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 7a34ca9c59cde0af620ffa30783348a9.
Strike Shikitega_7b229d73	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 7b229d73b7c5c55fda0e1f57ceaaf118.

<b>Name</b>	<b>Description</b>
Strike Shikitega_932df67e	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is 932df67ea6b8900a30249e311195a58f.
Strike Shikitega_b035f858	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is b035f85870bb17380b25189bd97b8e65.
Strike Shikitega_d1cd3293	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is d1cd3293ac4b312e0b3218e80376bd88.
Strike Shikitega_da193f6b	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is da193f6bf387f9884d88ace9c04278a0.
Strike Shikitega_fd3bc823	This strike sends a malware sample known as Shikitega. Shikitega is malware that targets devices that running the Linux OS. It is delivered in a multistage infection chain where each module responds to a part of the payload and then proceeds to download and execute the next module. When run a cryptominer is executed and the attacker can is potentially granted full access to the machine. The MD5 hash of this Shikitega sample is fd3bc823d9e6b1aa0622c36ebd5e69f2.
Strike Shiz_05656b0d	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 05656b0dd1f2c011d7b9e4f4de4f77a2.
Strike Shiz_07dbe784	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 07dbe7842a4dabd8c39f0af2bf1881d5.
Strike Shiz_09024d6e	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has the checksum removed in the PE file format. The MD5 hash of this Shiz sample is 09024d6e756bc7200ba179a6aeb9f41d.

<b>Name</b>	<b>Description</b>
Strike Shiz_228ee144	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 228ee1443e6f972d2cb502a4a030aac5.
Strike Shiz_22e33d40	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 22e33d40c6a620d29ceeb324ef5b5f40.
Strike Shiz_277b47f8	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 277b47f81244411d20903be4d78dd5d9.
Strike Shiz_28329ecd	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 28329ecd0afc07c18ab89730c81e7790.
Strike Shiz_2ede41ce	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 2ede41ce1e9f83d50cc15b2e56f74ddc.
Strike Shiz_36cda7c7	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 36cda7c70419a9c2d08cb110dd58b099.
Strike Shiz_3e302468	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 3e30246888275ebb416d4165f71b1fe8.
Strike Shiz_3f751fb4	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 3f751fb44ca9c7117fd90a07b2d32ee9.
Strike Shiz_47de3e4f	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Shiz sample is 47de3e4f669440589fe34532ad9114b2.
Strike Shiz_485acf5b	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random bytes appended at the end of the file. The MD5 hash of this Shiz sample is 485acf5b5c53e4b6f61c4add87c6373f.

<b>Name</b>	<b>Description</b>
Strike Shiz_49d9cd89	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. Strike Shiz_4bf9fddc	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 4bf9fddcd198b5cf5520bffd78be0c3c.
Strike Shiz_4cc39df1	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 4cc39df1f7950b7883fd861af127afd4.
Strike Shiz_4cc67d26	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 4cc67d2675a6f56f5c225c3eb05514b3.
Strike Shiz_4f199253	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Shiz sample is 4f199253542d306639e414eececcfbfa.
Strike Shiz_54a0c5c0	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 54a0c5c04b7cb0eba0d7614b41569b1b.
Strike Shiz_59a089a2	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has the checksum removed in the PE file format. The MD5 hash of this Shiz sample is 59a089a2c1cab2bd3f9c733cdc4f96cd.
Strike Shiz_59e0ece2	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 59e0ece2c571c1b1869c1e51888087c7.
Strike Shiz_5bc37cdd	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random bytes appended at the end of the file. The MD5 hash of this Shiz sample is 5bc37cddf1f3be9ad2f6d194a7206879.

<b>Name</b>	<b>Description</b>
Strike Shiz_62c6255f	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 62c6255f31f5d39b369f54f5f95d2edc.
Strike Shiz_6d394aee	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 6d394aeefa7d26f6d519a80138424f09.
Strike Shiz_6d3cbc15	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 6d3cbc15a8831097e04672b19add433f.
Strike Shiz_71115b7a	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 71115b7a8bd924854ee7a48c4b81ec5f.
Strike Shiz_81d65ce1	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 81d65ce15ce7fa9bfb9126d5644520b2.
Strike Shiz_8d53c30c	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 8d53c30c043c6b1a0cd34efa938caaf0.
Strike Shiz_9512be16	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is 9512be161d22bff3834ba5fecdc4eb6.
Strike Shiz_a15fbb32	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Shiz sample is a15fbb32ccf830baf1c4adbc32c871b6.
Strike Shiz_a1bee642	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is a1bee64292749498f62b3b0569fc66d4.
Strike Shiz_a451eb6c	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is a451eb6c5c0310114363df86a61b091b.

<b>Name</b>	<b>Description</b>
Strike Shiz_a47a581f	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is a47a581f94f93bef024f2f9c099ac15e.
Strike Shiz_a4c74c50	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is a4c74c5072de775c8bf23db0fea9e3f6.
Strike Shiz_b521ef3d	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is b521ef3da1cbd0f2883ac45bff7d2f7e.
Strike Shiz_ba522cea	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is ba522ceacf187c3aeee16f32af3031aa4.
Strike Shiz_c7e856bb	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is c7e856bba1e2e1abcecc9757f49c69fd.
Strike Shiz_d072d816	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is d072d816a7fd9b22d226fe4e27289e5a.
Strike Shiz_d1f42be9	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Shiz sample is d1f42be9b1870a1b52cf2dc07ff508e9.
Strike Shiz_d4a279b2	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Shiz sample is d4a279b2c8c86d8434c24de05f041252.
Strike Shiz_d662f757	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is d662f75719f02414a66a17b16a2c721d.

<b>Name</b>	<b>Description</b>
Strike Shiz_e136f6c7	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is e136f6c7b1f2cf7e6454e8dda99ae133.
Strike Shiz_e7e1bd55	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is e7e1bd5531ca3ad87a051bac9d1a80d3.
Strike Shiz_e811ff63	This strike sends a polymorphic malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Shiz sample is e811ff638e5c82869e40fc2a697de1b6.
Strike Shiz_eae062b8	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is eae062b8d75e0d3e442ed62a44a94b73.
Strike Shiz_eb6557c1	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is eb6557c1446859b1c4397535f8d68cb5.
Strike Shiz_eefadc74	This strike sends a malware sample known as Shiz. Shiz is a remote access trojan that allows an attacker to access an infected machine to harvest sensitive information like application passwords and browser cookies. The MD5 hash of this Shiz sample is eefadc749a3d7eb5ffde51f741241115.
Strike Shlayer_04e7bae9	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is 04e7bae95f86118fd5e347ee43537b06.
Strike Shlayer_1c859729	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is 1c859729bde4b392eaa1694c19ba5f9c.
Strike Shlayer_4d86ae25	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is 4d86ae25913374cfcb80a8d798b9016e.

<b>Name</b>	<b>Description</b>
Strike Shlayer_594aa050	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is 594aa050742406db04a8e07b5d247cdd.
Strike Shlayer_6ac3ae1c	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is 6ac3ae1ccb9038388e492a64ef08e5ec.
Strike Shlayer_9c88732f	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is 9c88732f4a04c10ec4853f871de6b5eb.
Strike Shlayer_b2b51960	This strike sends a malware sample known as Shlayer. Shlayer is a Trojan family of malware that targets the Mac OS platform. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Its main purpose is to infect a system and retrieve additional malware most typically adware. Like most adware, it displays unwanted advertising on the system. Most recently Shlayer has been delivered with Apple notarized applications. The MD5 hash of this Shlayer sample is fefcf50214786bbbd33ee67abd7f1f3.

<b>Name</b>	<b>Description</b>
Strike Sidewinder_0aea0695	This strike sends a malware sample known as Sidewinder. Sidewinder APT is a malware group that uses a variety of lures, decoy documents, and applications to infiltrate their targets. It uses a .NET-based malware called SharpStage and a document stealer called BlatSting. Upon execution, SharpStage downloads additional payloads and BlatSting steals documents. Key capabilities of the malware include downloading and executing additional payloads, stealing documents, and evading detection by using legitimate Windows features and obfuscated code. The MD5 hash of this Sidewinder sample is 0aea06959cdd43e43f8b9d4625267398.
Strike Sidewinder_243bfa39	This strike sends a malware sample known as Sidewinder. Sidewinder APT is a malware group that uses a variety of lures, decoy documents, and applications to infiltrate their targets. It uses a .NET-based malware called SharpStage and a document stealer called BlatSting. Upon execution, SharpStage downloads additional payloads and BlatSting steals documents. Key capabilities of the malware include downloading and executing additional payloads, stealing documents, and evading detection by using legitimate Windows features and obfuscated code. The MD5 hash of this Sidewinder sample is 243bfa3990d9b263e6ac1265735f79be.
Strike Sidewinder_6dbc9a6f	This strike sends a malware sample known as Sidewinder. Sidewinder APT is a malware group that uses a variety of lures, decoy documents, and applications to infiltrate their targets. It uses a .NET-based malware called SharpStage and a document stealer called BlatSting. Upon execution, SharpStage downloads additional payloads and BlatSting steals documents. Key capabilities of the malware include downloading and executing additional payloads, stealing documents, and evading detection by using legitimate Windows features and obfuscated code. The MD5 hash of this Sidewinder sample is 6dbc9a6f81f99e7c32529ab9835cbcfc0.
Strike Sidewinder_81dfbdb2	This strike sends a malware sample known as Sidewinder. Sidewinder APT is a malware group that uses a variety of lures, decoy documents, and applications to infiltrate their targets. It uses a .NET-based malware called SharpStage and a document stealer called BlatSting. Upon execution, SharpStage downloads additional payloads and BlatSting steals documents. Key capabilities of the malware include downloading and executing additional payloads, stealing documents, and evading detection by using legitimate Windows features and obfuscated code. The MD5 hash of this Sidewinder sample is 81dfbdb2056db1b33440e8d3d57511d5.
Strike Sidewinder_88109f66	This strike sends a malware sample known as Sidewinder. Sidewinder APT is a malware group that uses a variety of lures, decoy documents, and applications to infiltrate their targets. It uses a .NET-based malware called SharpStage and a document stealer called BlatSting. Upon execution, SharpStage downloads additional payloads and BlatSting steals documents. Key capabilities of the malware include downloading and executing additional payloads, stealing documents, and evading detection by using legitimate Windows features and obfuscated code. The MD5 hash of this Sidewinder sample is 88109f669191ff1809c662a6691dcfc7.

<b>Name</b>	<b>Description</b>

Strike SlowStepper_2ba80036	This strike sends a malware sample known as SlowStepper. SlowStepper is a backdoor malware. This malware is associated with the PlushDaemon Chinese APT group that hijacks legitimate applications and redirects victims to attacker controlled servers. This sample is tied to a trojanized version of the IPany VPN software. The MD5 hash of this SlowStepper sample is 2ba80036b9554d9722e199e9d0065831.
Strike SlowStepper_e2bc2361	This strike sends a malware sample known as SlowStepper. SlowStepper is a backdoor malware. This malware is associated with the PlushDaemon Chinese APT group that hijacks legitimate applications and redirects victims to attacker controlled servers. This sample is tied to a trojanized version of the IPany VPN software. The MD5 hash of this SlowStepper sample is e2bc2361ead7c80eba86a5d1c492865d.
Strike SlowStepper_ecb6b71b	This strike sends a malware sample known as SlowStepper. SlowStepper is a backdoor malware. This malware is associated with the PlushDaemon Chinese APT group that hijacks legitimate applications and redirects victims to attacker controlled servers. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this SlowStepper sample is ecb6b71bf815f5509629ee028887b3dd.
Strike SnappyBee_334c9477	This strike sends a malware sample known as SnappyBee. SnappyBee is a modular backdoor malware. Recently it has been associated with Earth E strikes aka Salt Typhoon campaigns. The malware is typically launched as a follow on backdoor via DLL sideloading techniques. The MD5 hash of this SnappyBee sample is 334c9477f71802c57349a997b8bf6d61.
Strike SnappyBee_43f3f328	This strike sends a malware sample known as SnappyBee. SnappyBee is a modular backdoor malware. Recently it has been associated with Earth E strikes aka Salt Typhoon campaigns. The malware is typically launched as a follow on backdoor via DLL sideloading techniques. The MD5 hash of this SnappyBee sample is 43f3f328248da7bda95407968604ff0b.
Strike SnappyBee_45d79973	This strike sends a malware sample known as SnappyBee. SnappyBee is a modular backdoor malware. Recently it has been associated with Earth E strikes aka Salt Typhoon campaigns. The malware is typically launched as a follow on backdoor via DLL sideloading techniques. The MD5 hash of this SnappyBee sample is 45d7997340065904ae092ac427c54f41.
Strike SnappyBee_505b55c2	This strike sends a malware sample known as SnappyBee. SnappyBee is a modular backdoor malware. Recently it has been associated with Earth E strikes aka Salt Typhoon campaigns. The malware is typically launched as a follow on backdoor via DLL sideloading techniques. The MD5 hash of this SnappyBee sample is 505b55c2b68e32acb5ad13588e1491a5.

<b>Name</b>	<b>Description</b>
Strike SnappyBee_8bd8506f	This strike sends a malware sample known as SnappyBee. SnappyBee is a modular backdoor malware. Recently it has been associated with Earth E strikes aka Salt Typhoon campaigns. The malware is typically launched as a follow on backdoor via DLL sideloading techniques. The MD5 hash of this SnappyBee sample is 8bd8506f6b1a80eea68e877fa81e267c.
Strike SnappyBee_b706f480	This strike sends a malware sample known as SnappyBee. SnappyBee is a modular backdoor malware. Recently it has been associated with Earth E strikes aka Salt Typhoon campaigns. The malware is typically launched as a follow on backdoor via DLL sideloading techniques. The MD5 hash of this SnappyBee sample is b706f4806dc88611873caddeb3ad1ff97.
Strike SnipBot_0cd8736a	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is 0cd8736a915e8e32ddeda21ed462670b.
Strike SnipBot_36d4903f	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is 36d4903ffafa75c00460292881b5dad7.
Strike SnipBot_43cc1f2f	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. Strike SnipBot_524dda24	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is 524dda2410cc7ee8cc326ca42cebd7dd.
Strike SnipBot_6fa6dd33	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is 6fa6dd331844ee5cfe20c74353c1e442.

<b>Name</b>	<b>Description</b>
Strike SnipBot_7f2e4a44	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is 7f2e4a44445b977ef8917cc0fb79035b.
Strike SnipBot_c0e49940	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is c0e499402acb6c302228b4a7923d5db6.
Strike SnipBot_d69cf309	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is d69cf309cb0e5d91237c6454e0e0dc45.
Strike SnipBot_fa400cb7	This strike sends a malware sample known as SnipBot. SnipBot is malware that is being associated with the RomCom malware family. The malware is usually composed of several stages. It begins with some sort of phishing attempt, typically a pdf document that initiates the infection process and delivers a signed executable. This malware has RAT functionality, and gives attackers the ability to execute commands and download modules onto a victim's system. The MD5 hash of this SnipBot sample is fa400cb70d13cb329d05877b8fe73ed5.
Strike Sodinokibi_177a571d	This strike sends a malware sample known as Sodinokibi. Sodinokibi ransomware takes advantage of a Oracle WebLogic vulnerability to gain access to target system. Once inside, it attempts to elevate privileges in order to access all files and resources on the system without any restriction. It will then wipe out all files in the backup folder. The MD5 hash of this Sodinokibi sample is 177a571d7c6a6e4592c60a78b574fe0e.
Strike Sodinokibi_858c29ef	This strike sends a polymorphic malware sample known as Sodinokibi. Sodinokibi ransomware takes advantage of a Oracle WebLogic vulnerability to gain access to target system. Once inside, it attempts to elevate privileges in order to access all files and resources on the system without any restriction. It will then wipe out all files in the backup folder. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Sodinokibi sample is 858c29efee084e86616b21fdc4d2a3de.

<b>Name</b>	<b>Description</b>
Strike Sodinokibi_bf935904	This strike sends a malware sample known as Sodinokibi. Sodinokibi ransomware takes advantage of a Oracle WebLogic vulnerability to gain access to target system. Once inside, it attempts to elevate privileges in order to access all files and resources on the system without any restriction. It will then wipe out all files in the backup folder. The MD5 hash of this Sodinokibi sample is bf9359046c4f5c24de0a9de28bbabd14.
Strike Sodinokibi_e713658b	This strike sends a malware sample known as Sodinokibi. Sodinokibi ransomware takes advantage of a Oracle WebLogic vulnerability to gain access to target system. Once inside, it attempts to elevate privileges in order to access all files and resources on the system without any restriction. It will then wipe out all files in the backup folder. The MD5 hash of this Sodinokibi sample is e713658b666ff04c9863ebecb458f174.
Strike Sodinokibi_fb68a023	This strike sends a malware sample known as Sodinokibi. Sodinokibi ransomware takes advantage of a Oracle WebLogic vulnerability to gain access to target system. Once inside, it attempts to elevate privileges in order to access all files and resources on the system without any restriction. It will then wipe out all files in the backup folder. The MD5 hash of this Sodinokibi sample is fb68a02333431394a9a0cdbff3717b24.
Strike SolarPhantom_0700af85	This strike sends a malware sample known as SolarPhantom. SolarPhantom is an advanced malware linked to the SolarMarker threat actor, primarily in .NET with a Delphi-coded hVNC backdoor. It targets diverse industries through compromised WordPress sites and manipulates browser processes. Its hVNC functionality captures webcam footage and simulates mouse events on a hidden virtual desktop. The malware employs evasion techniques, disabling browser metrics and hardware acceleration. During execution, it communicates with the C2 server, sending host computer details and a randomly generated HWID. SolarPhantom showcases adaptability, modifying its PowerShell script and employing varying delivery methods and payloads. The MD5 hash of this SolarPhantom sample is 0700af859d2379420774145592f8862e.
Strike SolarPhantom_1a5e7b4c	This strike sends a malware sample known as SolarPhantom. SolarPhantom is an advanced malware linked to the SolarMarker threat actor, primarily in .NET with a Delphi-coded hVNC backdoor. It targets diverse industries through compromised WordPress sites and manipulates browser processes. Its hVNC functionality captures webcam footage and simulates mouse events on a hidden virtual desktop. The malware employs evasion techniques, disabling browser metrics and hardware acceleration. During execution, it communicates with the C2 server, sending host computer details and a randomly generated HWID. SolarPhantom showcases adaptability, modifying its PowerShell script and employing varying delivery methods and payloads. The MD5 hash of this SolarPhantom sample is 1a5e7b4cbe34ee385225da8715562f5d.

<b>Name</b>	<b>Description</b>
Strike SolarPhantom_1adbaaa3	This strike sends a malware sample known as SolarPhantom. SolarPhantom is an advanced malware linked to the SolarMarker threat actor, primarily in .NET with a Delphi-coded hVNC backdoor. It targets diverse industries through compromised WordPress sites and manipulates browser processes. Its hVNC functionality captures webcam footage and simulates mouse events on a hidden virtual desktop. The malware employs evasion techniques, disabling browser metrics and hardware acceleration. During execution, it communicates with the C2 server, sending host computer details and a randomly generated HWID. SolarPhantom showcases adaptability, modifying its PowerShell script and employing varying delivery methods and payloads. The MD5 hash of this SolarPhantom sample is 1adbaaa352a8366c03faaa44fc5d4687.
Strike SolarPhantom_23807082	This strike sends a malware sample known as SolarPhantom. SolarPhantom is an advanced malware linked to the SolarMarker threat actor, primarily in .NET with a Delphi-coded hVNC backdoor. It targets diverse industries through compromised WordPress sites and manipulates browser processes. Its hVNC functionality captures webcam footage and simulates mouse events on a hidden virtual desktop. The malware employs evasion techniques, disabling browser metrics and hardware acceleration. During execution, it communicates with the C2 server, sending host computer details and a randomly generated HWID. SolarPhantom showcases adaptability, modifying its PowerShell script and employing varying delivery methods and payloads. The MD5 hash of this SolarPhantom sample is 23807082358d736404cf935fe7c65b5.
Strike SolarPhantom_38cbe65f	This strike sends a malware sample known as SolarPhantom. SolarPhantom is an advanced malware linked to the SolarMarker threat actor, primarily in .NET with a Delphi-coded hVNC backdoor. It targets diverse industries through compromised WordPress sites and manipulates browser processes. Its hVNC functionality captures webcam footage and simulates mouse events on a hidden virtual desktop. The malware employs evasion techniques, disabling browser metrics and hardware acceleration. During execution, it communicates with the C2 server, sending host computer details and a randomly generated HWID. SolarPhantom showcases adaptability, modifying its PowerShell script and employing varying delivery methods and payloads. The MD5 hash of this SolarPhantom sample is 38cbe65f8d2221a6c1b32abd4c96206d.
Strike SolarPhantom_50b9e707	This strike sends a malware sample known as SolarPhantom. SolarPhantom is an advanced malware linked to the SolarMarker threat actor, primarily in .NET with a Delphi-coded hVNC backdoor. It targets diverse industries through compromised WordPress sites and manipulates browser processes. Its hVNC functionality captures webcam footage and simulates mouse events on a hidden virtual desktop. The malware employs evasion techniques, disabling browser metrics and hardware acceleration. During execution, it communicates with the C2 server, sending host computer details and a randomly generated HWID. SolarPhantom showcases adaptability, modifying its PowerShell script and employing varying delivery methods and payloads. The MD5 hash of this SolarPhantom sample is 50b9e707bd2c1adff933a688ee862463.

Name	Description
Strike SpyBanker_5b1203a0	<p>This strike sends a malware sample known as SpyBanker. The malware disguises itself as official banking apps, employing a common social engineering tactic to impersonate legitimate banks and financial institution that targets customers of major financial institutions. The campaigns involve sharing malicious APK files through platforms like WhatsApp, prompting users to enter sensitive information. The installed fraudulent app impersonates a legitimate Indian bank's Know Your Customer (KYC) application, tricking users into submitting sensitive information, which is then sent to a command and control (C2) server and the attacker's designated phone number. 'com.sk.axisbank' is the package name of the malware sample. The MD5 hash of this malware sample is 5b1203a0def70d1f5aff2bf67d7c9537.</p>
Strike SpyBanker_63689e7c	<p>This strike sends a polymorphic malware sample known as SpyBanker. The malware disguises itself as official banking apps, employing a common social engineering tactic to impersonate legitimate banks and financial institution that targets customers of major financial institutions. The campaigns involve sharing malicious APK files through platforms like WhatsApp, prompting users to enter sensitive information. The installed fraudulent app impersonates a legitimate Indian bank's Know Your Customer (KYC) application, tricking users into submitting sensitive information, which is then sent to a command and control (C2) server and the attacker's designated phone number. 'com.sk.axisbank' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 63689e7c7e32815fb1d8133d2c5525fa.</p>

<b>Name</b>	<b>Description</b>
Strike SpyLoan_3461f57f	<p>This strike sends a polymorphic malware sample known as SpyLoan. The malware masquerades as Android loan apps, presenting itself as a financial service while actively collecting personal and financial data. The apps, distributed through social media, SMS, and scam websites, employ coercive practices, harassing users even when loans are not granted. The operators, primarily from various countries, coerce victims into providing extensive permissions during installation, thereby granting access to sensitive information. The apps demand personal details, including contact information, proof of income, and banking information, along with collecting additional device data. The harvested information is then actively exfiltrated to a command-and-control server using encryption techniques. 'com.app.lo.go' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 3461f57f0fa50a5f8c5d6b1208181351.</p>

Strike SuperBear_26893a46	This strike sends a malware sample known as SuperBear. SuperBear is a RAT malware. This RAT exfiltrates system data and communicates with C2 servers to run remote commands like downloading and executing dlls. The MD5 hash of this SuperBear sample is 26893a46de61332fd08820d5dc56cd19.
Strike SuperBear_e49aaa9a	This strike sends a malware sample known as SuperBear. SuperBear is a RAT malware. This RAT exfiltrates system data and communicates with C2 servers to run remote commands like downloading and executing dlls. The MD5 hash of this SuperBear sample is e49aaa9a5933c48feca39f3080a7b94d.

<b>Name</b>	<b>Description</b>
Strike Swisyn_0bbf4eeb	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 0bbf4eeb3156b94827c8aecff920cf4e.
Strike Swisyn_25a9aeb7	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 25a9aeb787c07a0e6a664bf3d40bf5da.
Strike Swisyn_5dbec059	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 5dbec059892d83ce640453b4696187eb.
Strike Swisyn_6949648f	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 6949648f8c2740ed5ea0ab9fe95b0326.
Strike Swisyn_7954f536	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 7954f536503d9016dadaf9ae06f5a5ef.
Strike Swisyn_8e804a33	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 8e804a339c9161bc85356fc84016b7b5.
Strike Swisyn_980749e4	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is 980749e4a0ed0362d66b12a26471e807.
Strike Swisyn_b19d3c9a	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is b19d3c9a48265ce37b1d246dd7ef76a7.
Strike Swisyn_d6a8e57a	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is d6a8e57addc7e4c4075435d7b5318364.
Strike Swisyn_edf4bc30	This strike sends a malware sample known as Swisyn. Swisyn is a loader that installs malicious software on the system, including remote access tool functionality, allowing the controller to perform any malicious action. The MD5 hash of this Swisyn sample is edf4bc30b9c905890317079156c84fbb.

<b>Name</b>	<b>Description</b>
Strike SysJoker_2eaf0c5	<p>This strike sends a malware sample known as SysJoker. SysJoker RAT is a cross-platform malware which targets Windows, Linux and macOS operating systems. This variant of the malware is written in Rust and since it is cross-platform it allows the malware authors to gain advantage of wide infection on all major platforms. SysJoker can execute commands remotely as well as download and execute new malware on victim machines. SysJoker contacts a URL on OneDrive to retrieve the C2 server address. Using OneDrive allows the attackers to easily change the C2 address, which enables them to stay ahead of different reputation-based services. The major functionality remains the same in all three platforms due to its shared code. The MD5 hash of this SysJoker sample is 2eaf0c5c2bf567631e08c999edb17cd.</p>

Strike TA402_0de40d66	This strike sends a malware sample known as TA402. This sample belongs to TA402 malware campaign that targets Middle Eastern and North African Government Entities, employing the IronWind downloader. They utilize weaponized XLL and RAR files to evade detection. The campaign involves phishing emails that pose as economic affairs messages. These emails lead to the download of a malicious Microsoft PowerPoint Add-in (PPAM) file containing IronWind and additional components. The malware utilizes a C2 domain and executes a multi-stage infection process that involves shellcode and .NET loaders. The MD5 hash of this TA402 sample is 0de40d666d23ecfd3d6b12f0ce567631.
Strike TA402_0e24fa3b	This strike sends a malware sample known as TA402. This sample belongs to TA402 malware campaign that targets Middle Eastern and North African Government Entities, employing the IronWind downloader. They utilize weaponized XLL and RAR files to evade detection. The campaign involves phishing emails that pose as economic affairs messages. These emails lead to the download of a malicious Microsoft PowerPoint Add-in (PPAM) file containing IronWind and additional components. The malware utilizes a C2 domain and executes a multi-stage infection process that involves shellcode and .NET loaders. The MD5 hash of this TA402 sample is 0e24fa3bb4de4977e68fa4438c025d9d.
Strike TA402_66572a74	This strike sends a malware sample known as TA402. This sample belongs to TA402 malware campaign that targets Middle Eastern and North African Government Entities, employing the IronWind downloader. They utilize weaponized XLL and RAR files to evade detection. The campaign involves phishing emails that pose as economic affairs messages. These emails lead to the download of a malicious Microsoft PowerPoint Add-in (PPAM) file containing IronWind and additional components. The malware utilizes a C2 domain and executes a multi-stage infection process that involves shellcode and .NET loaders. The MD5 hash of this TA402 sample is 66572a740d26abf3ea131704957ff7a6.
Strike TA402_70f3b724	This strike sends a malware sample known as TA402. Strike TeslaCrypt_170e75ff	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has a new section added in the PE file format with random contents. The MD5 hash of this TeslaCrypt sample is 170e75ffff7010ecec4d6b282149d0ba.
Strike TeslaCrypt_1a0731a3	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 1a0731a3fde61b4f8d190fe11a6022ab.
Strike TeslaCrypt_1a1f3710	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 1a1f3710088a7a5c062ad9c43b0628f8.
Strike TeslaCrypt_20238f80	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 20238f801e16af46fc3eaf64cb6e6126.
Strike TeslaCrypt_25a8164a	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 25a8164a44d68e0989967bec65e2818d.
Strike TeslaCrypt_2850b227	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has a new section added in the PE file format with random contents. The MD5 hash of this TeslaCrypt sample is 2850b22756a0e1cf164d0801bc0430ff.
Strike TeslaCrypt_29d80860	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random bytes appended at the end of the file. The MD5 hash of this TeslaCrypt sample is 29d80860c96bacff05812456d7621754.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_2d4d0fa0	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 2d4d0fa03435636ea85e603be1055031.
Strike TeslaCrypt_36b9c9f9	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 36b9c9f9f3e9b07ec4f9d5c273e3b9de.
Strike TeslaCrypt_38602df4	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 38602df4390dbda254d40126d7d992b2.
Strike TeslaCrypt_3cb16522	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has the checksum removed in the PE file format. The MD5 hash of this TeslaCrypt sample is 3cb16522d05fbded5f94226d7d4f6ed8.
Strike TeslaCrypt_3d1d2104	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 3d1d21040e9d68cbf02e146ad0ad67eb.
Strike TeslaCrypt_412f4761	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 412f4761dcf9e20ad8a05a16663fbc7e.
Strike TeslaCrypt_4345e8d9	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this TeslaCrypt sample is 4345e8d98cb826d3f493ad03ebdf2f46.
Strike TeslaCrypt_4573ead0	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has the timestamp field updated in the PE file header. The MD5 hash of this TeslaCrypt sample is 4573ead04797a7287b4c320e46042cc3.
Strike TeslaCrypt_48e0d4d3	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 48e0d4d3fba9365813688afdf9bfbd1f.
Strike TeslaCrypt_4ae42e33	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 4ae42e33f8104a47ae1b19542607f753.
Strike TeslaCrypt_4bc07d04	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 4bc07d04b3a595d727461619e72b8af2.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_4bdd826e	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 4bdd826e9cd92d7cd6a44d36d8793301.
Strike TeslaCrypt_4d69c441	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 4d69c441231bad3e39da8230388920e5.
Strike TeslaCrypt_509f3621	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 509f3621ccd1590cbc7b7f87de9649f2.
Strike TeslaCrypt_5104dda9	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 5104dda9b6b6558fcfd70c784f56cacd.
Strike TeslaCrypt_54dff53b	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 54dff53b7630c027c95c7285dd8d001e.
Strike TeslaCrypt_557e0286	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 557e0286e6a1ddf962180d0aef426f56.
Strike TeslaCrypt_55b87f03	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has been packed using upx packer, with the default options. The MD5 hash of this TeslaCrypt sample is 55b87f0397e4600386250f2047c773c4.
Strike TeslaCrypt_57b0420e	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 57b0420ebd965ccc489ab60cde9320a0.
Strike TeslaCrypt_584e49db	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 584e49dbe037b315b67b79a7f9a404eb.
Strike TeslaCrypt_5869bba8	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 5869bba88bcd0a572bdf48bf79a96084.
Strike TeslaCrypt_5c6911fb	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this TeslaCrypt sample is 5c6911fb1f0dca9df6cabd7c83d9814f.
Strike TeslaCrypt_6127d0d5	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 6127d0d566524543ede893d4713d4ea5.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_6215feec	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 6215feecc1e772a83859ced35318ed2b.
Strike TeslaCrypt_6266203e	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 6266203ec37b67ad31e71d3216f3fe90.
Strike TeslaCrypt_63d2e5b7	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has a new section added in the PE file format with random contents. The MD5 hash of this TeslaCrypt sample is 63d2e5b72bcd3fd3b0f3b29ada81841a.
Strike TeslaCrypt_6626b29f	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 6626b29fab9e9465d265344871bc897e.
Strike TeslaCrypt_69d66bd8	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 69d66bd8dc40d804d2896855b381d1c7.
Strike TeslaCrypt_6af11c2d	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 6af11c2d6e86170a456fcabe79d7cdfe.
Strike TeslaCrypt_751ec5f3	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 751ec5f39b6fe277cad8374f11331f15.
Strike TeslaCrypt_76f35d2e	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random bytes appended at the end of the file. The MD5 hash of this TeslaCrypt sample is 76f35d2e565f0d04ccafb16742520272.
Strike TeslaCrypt_796aa3c8	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 796aa3c80d4b3be5333cbc910071612a.
Strike TeslaCrypt_7b079fdf	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 7b079fdfae4d32274dc53ba03fc7cb51.
Strike TeslaCrypt_818fe0f4	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has been packed using upx packer, with the default options. The MD5 hash of this TeslaCrypt sample is 818fe0f40198d785ce706bd80319cfe1.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_8489707b	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 8489707b1115144a60e83e85d79eb0d0.
Strike TeslaCrypt_854bca4d	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 854bca4dcd3f09e07df658db8c2daed0.
Strike TeslaCrypt_8915b658	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 8915b658510bbaa95c236ae4a82cced4.
Strike TeslaCrypt_8a5d6838	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 8a5d68384093d008fded0bbcfcf29fc42.
Strike TeslaCrypt_944c417c	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this TeslaCrypt sample is 944c417c908647ea786aa836dcf87289.
Strike TeslaCrypt_975117b1	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 975117b1c5fd0363e160b381280a33fe.
Strike TeslaCrypt_991ff593	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is 991ff593a3b9b297ef6e2563b47f2d82.
Strike TeslaCrypt_9b77979f	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this TeslaCrypt sample is 9b77979fed5ef112cc96f9554f903842.
Strike TeslaCrypt_9d13bae9	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has the timestamp field updated in the PE file header. The MD5 hash of this TeslaCrypt sample is 9d13bae96cf4e77b52e630586907ac16.
Strike TeslaCrypt_a0ad76a6	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is a0ad76a66a5e8cf5daea3158acff1c29.
Strike TeslaCrypt_a1606deb	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is a1606deb54f2d523cf7d2266179fdf70.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_a48b4000	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is a48b4000ec1866cb6e7a23b5bdbe37db.
Strike TeslaCrypt_a874ef39	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is a874ef3926e59eac0b158fd5e6a9a35f.
Strike TeslaCrypt_af3c3d0d	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is af3c3d0d579ee843d7957d1a1423f2fc.
Strike TeslaCrypt_b345e64a	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is b345e64a78fb601f096abf9e024ca89c.
Strike TeslaCrypt_b3b0743d	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is b3b0743dc39bf9963736e85f61002134.
Strike TeslaCrypt_b6d8812f	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is b6d8812fc7198cf125d15e280e7ce8fc.
Strike TeslaCrypt_c0fb9afc	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has the checksum removed in the PE file format. The MD5 hash of this TeslaCrypt sample is c0fb9afc7f80a40fc173f6ff0c42d227.
Strike TeslaCrypt_c24ddf1c	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is c24ddf1ca6c1f26653f29e0e24a83f2c.
Strike TeslaCrypt_c318cb9a	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is c318cb9a36f9c7ee5b15b589ed7b594f.
Strike TeslaCrypt_c32375be	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is c32375be2b606807f997c0d68dcc0b8a.
Strike TeslaCrypt_c4644580	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary file has one more imports added in the import table. The MD5 hash of this TeslaCrypt sample is c464458070c7909d7de471e5630592f0.
Strike TeslaCrypt_cb7d4940	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is cb7d494023414e8d71f14a39b9819e3c.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_cea7506c	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is cea7506c22e161b3703543ee421f70c8.
Strike TeslaCrypt_cf4612e2	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this TeslaCrypt sample is cf4612e28ccf1a1476429f463116d6cc.
Strike TeslaCrypt_d05d1a0c	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is d05d1a0c12ab22e18f491d6e14c22eb5.
Strike TeslaCrypt_d9807993	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is d9807993573f3877545868116b424bc7.
Strike TeslaCrypt_da37801e	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is da37801eb453924749147d77069cb557.
Strike TeslaCrypt_db8af569	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is db8af56918c0c3fa87d1c1a631ab423c.
Strike TeslaCrypt_dd587d20	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is dd587d20de9a14d86bdbc4ed94584038.
Strike TeslaCrypt_e126aa94	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is e126aa94d0d2ac98f9baa482bf48672a.
Strike TeslaCrypt_e12714cc	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is e12714cc500326d836bc2e13b195977a.
Strike TeslaCrypt_e747b47b	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is e747b47bf6413c1c9c8b390c1d6968f3.
Strike TeslaCrypt_e99bd4d8	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is e99bd4d8d715d93645c3850fc2c2e1d3.
Strike TeslaCrypt_eae946a1	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is eae946a10a840370d1d8ddb919b284f2.

<b>Name</b>	<b>Description</b>
Strike TeslaCrypt_f00ffef3	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has the checksum removed in the PE file format. The MD5 hash of this TeslaCrypt sample is f00ffef31cf1df10a9d06e6b931798b7.
Strike TeslaCrypt_f15f513d	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is f15f513d2a3784e9b56bd2f80dc6f088.
Strike TeslaCrypt_f27112dc	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is f27112dc5d2e62d0f6748b1478bd3578.
Strike TeslaCrypt_f5c24ce9	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is f5c24ce99fc9ffc9ff25cf8bdfe7c033.
Strike TeslaCrypt_f61b3c14	This strike sends a polymorphic malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this TeslaCrypt sample is f61b3c14d032796e892fda0214bb6ada.
Strike TeslaCrypt_f7edddc4	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is f7edddc47a40465556c2b75cccd972e1d.
Strike TeslaCrypt_f8c510f5	This strike sends a malware sample known as TeslaCrypt. This ransomware demands Bitcoin in order to decrypt files from the system. The MD5 hash of this TeslaCrypt sample is f8c510f569bb2daf365c01e002e9bf48.
Strike Thanos_03b76a51	This strike sends a malware sample known as Thanos. Thanos ransomware offers the user the option to customize and include a variety of functions and capabilities. The Thanos builder code was recently made available and many variants have started to surface with its framework at the core. This version of Thanos includes the ability to overwrite the MBR and display the same ransom message, as well as the ability to detect and evade analysis tools. The MD5 hash of this Thanos sample is 03b76a5130d0df8134a6bdea7fe97bcd.
Strike Thanos_18cec1f1	This strike sends a polymorphic malware sample known as Thanos. Thanos ransomware offers the user the option to customize and include a variety of functions and capabilities. The Thanos builder code was recently made available and many variants have started to surface with its framework at the core. This version of Thanos includes the ability to overwrite the MBR and display the same ransom message, as well as the ability to detect and evade analysis tools. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Thanos sample is 18cec1f15061129aff9fa49bc639dbbe.

<b>Name</b>	<b>Description</b>
Strike Thanos_1d45efc7	This strike sends a polymorphic malware sample known as Thanos. Thanos ransomware offers the user the option to customize and include a variety of functions and capabilities. The Thanos builder code was recently made available and many variants have started to surface with its framework at the core. This version of Thanos includes the ability to overwrite the MBR and display the same ransom message, as well as the ability to detect and evade analysis tools. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Thanos sample is 1d45efc7078b10c28a1d606053d066af.
Strike Thanos_be60e389	This strike sends a malware sample known as Thanos. Thanos ransomware offers the user the option to customize and include a variety of functions and capabilities. The Thanos builder code was recently made available and many variants have started to surface with its framework at the core. This version of Thanos includes the ability to overwrite the MBR and display the same ransom message, as well as the ability to detect and evade analysis tools. The MD5 hash of this Thanos sample is be60e389a0108b2871dff12dfbb542ac.
Strike Thanos_d6d95626	This strike sends a malware sample known as Thanos. Thanos ransomware offers the user the option to customize and include a variety of functions and capabilities. The Thanos builder code was recently made available and many variants have started to surface with its framework at the core. This version of Thanos includes the ability to overwrite the MBR and display the same ransom message, as well as the ability to detect and evade analysis tools. The MD5 hash of this Thanos sample is d6d956267a268c9dcf48445629d2803e.
Strike Thanos_e01e11dc	This strike sends a malware sample known as Thanos. Thanos ransomware offers the user the option to customize and include a variety of functions and capabilities. The Thanos builder code was recently made available and many variants have started to surface with its framework at the core. This version of Thanos includes the ability to overwrite the MBR and display the same ransom message, as well as the ability to detect and evade analysis tools. The MD5 hash of this Thanos sample is e01e11dca5e8b08fc8231b1cb6e2048c.
Strike TinyBanker_10b587c2	This strike sends a malware sample known as TinyBanker. The malware TinyBanker, also known as Zusy or Tinba, is a trojan that uses a javascript injected form to steal banking information. When executed, it injects itself into Windows processes like "explorer.exe" and "winver.exe. The MD5 hash of this TinyBanker sample is 10b587c21e9e11de2c9815423f035095.
Strike TinyBanker_2fc76498	This strike sends a malware sample known as TinyBanker. The malware TinyBanker, also known as Zusy or Tinba, is a trojan that uses a javascript injected form to steal banking information. When executed, it injects itself into Windows processes like "explorer.exe" and "winver.exe. The MD5 hash of this TinyBanker sample is 2fc764982d67accb3b0f94fb7e19ef94.
Strike TinyBanker_b20386f9	This strike sends a malware sample known as TinyBanker. The malware TinyBanker, also known as Zusy or Tinba, is a trojan that uses a javascript injected form to steal banking information. When executed, it injects itself into Windows processes like "explorer.exe" and "winver.exe. The MD5 hash of this TinyBanker sample is b20386f967f4214050b3c18f5d335f9c.

<b>Name</b>	<b>Description</b>
Strike TinyBanker_ebf2fb86	This strike sends a malware sample known as TinyBanker. The malware TinyBanker, also known as Zusy or Tinba, is a trojan that uses a javascript injected form to steal banking information. When executed, it injects itself into Windows processes like "explorer.exe" and "winver.exe. The MD5 hash of this TinyBanker sample is ebf2fb861086af8914d60d11d6451977.
Strike ToddyCat_0f7002aa	This strike sends a malware sample known as ToddyCat. This sample is a ToddyCat Loader. ToddyCat is an APT actor that was previously detected attacking high profile target's Microsoft Exchange Servers. Their attacks utilize numerous malware loaders which are invoked by several executables including rundll32.exe, and VLC.exe. ToddyCat's latest attacks use these loaders as well as other trojans to collect and exfiltrate sensitive information from the target. The MD5 hash of this ToddyCat sample is 0f7002aaca8c1e71959c3ee635a85f14.
Strike ToddyCat_90b14807	This strike sends a malware sample known as ToddyCat. This sample is a ToddyCat Loader. ToddyCat is an APT actor that was previously detected attacking high profile target's Microsoft Exchange Servers. Their attacks utilize numerous malware loaders which are invoked by several executables including rundll32.exe, and VLC.exe. ToddyCat's latest attacks use these loaders as well as other trojans to collect and exfiltrate sensitive information from the target. The MD5 hash of this ToddyCat sample is 90b14807734045f1e0a47c40df949ac4.
Strike ToddyCat_97d0a47b	This strike sends a malware sample known as ToddyCat. This sample is a ToddyCat Loader. ToddyCat is an APT actor that was previously detected attacking high profile target's Microsoft Exchange Servers. Their attacks utilize numerous malware loaders which are invoked by several executables including rundll32.exe, and VLC.exe. ToddyCat's latest attacks use these loaders as well as other trojans to collect and exfiltrate sensitive information from the target. The MD5 hash of this ToddyCat sample is 97d0a47b595a20a3944919863a8163d1.
Strike ToddyCat_bebbeba3	This strike sends a malware sample known as ToddyCat. This sample is a ToddyCat Loader. ToddyCat is an APT actor that was previously detected attacking high profile target's Microsoft Exchange Servers. Their attacks utilize numerous malware loaders which are invoked by several executables including rundll32.exe, and VLC.exe. ToddyCat's latest attacks use these loaders as well as other trojans to collect and exfiltrate sensitive information from the target. The MD5 hash of this ToddyCat sample is bebbeba37667453003d2372103c45bbf.
Strike ToddyCat_d3050b3c	This strike sends a malware sample known as ToddyCat. This sample is a ToddyCat Loader. ToddyCat is an APT actor that was previously detected attacking high profile target's Microsoft Exchange Servers. Their attacks utilize numerous malware loaders which are invoked by several executables including rundll32.exe, and VLC.exe. ToddyCat's latest attacks use these loaders as well as other trojans to collect and exfiltrate sensitive information from the target. The MD5 hash of this ToddyCat sample is d3050b3c7ee8a80d8d67006246266d.

<b>Name</b>	<b>Description</b>
Strike ToddyCat_d4d8131e	This strike sends a malware sample known as ToddyCat. This sample is a ToddyCat Loader. ToddyCat is an APT actor that was previously detected attacking high profile target's Microsoft Exchange Servers. Their attacks utilize numerous malware loaders which are invoked by several executables including rundll32.exe, and VLC.exe. ToddyCat's latest attacks use these loaders as well as other trojans to collect and exfiltrate sensitive information from the target. The MD5 hash of this ToddyCat sample is d4d8131ed03b71d58b1ba348f9606df7.
Strike Tofsee_03d12b8e	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 03d12b8e29cbd18b673cedb0f7f86d5c.
Strike Tofsee_12125ce0	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 12125ce015e5fba34c2c3bac921a9f86.
Strike Tofsee_1256c61a	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 1256c61ada24718d6b0cc42c36c0ab10.
Strike Tofsee_194cf82e	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 194cf82e76ce8a5b05cbae71a892867a.
Strike Tofsee_468df98d	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 468df98df8cb4d17f1bf59dabb5431ee.

<b>Name</b>	<b>Description</b>
Strike Tofsee_4880a2fe	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 4880a2fecf841b3240a81e4dc09e6fae.
Strike Tofsee_5753474b	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 5753474b849e19b4f01031db304a79c4.
Strike Tofsee_80ab43e7	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 80ab43e77b53fe54bb824639ac3f0a1c.
Strike Tofsee_8a9166da	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 8a9166dac7113acaf058280e65ff78d0.
Strike Tofsee_9aa860e5	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is 9aa860e53a8e63e3307140ece140db80.
Strike Tofsee_b130c37e	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is b130c37e492949683b222e530a435769.

<b>Name</b>	<b>Description</b>
Strike Tofsee_b6fba6a2	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is b6fba6a2d04ffaa0834c71357d563ed8.
Strike Tofsee_c1b67151	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. Strike Tofsee_dc4b262a	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is dc4b262a11999bdd8882a791ffd7bdca.
Strike Tofsee_e472ee3e	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is e472ee3e314ec90bffe73a273eab982.

<b>Name</b>	<b>Description</b>
Strike Tofsee_e9f4b1d3	This strike sends a malware sample known as Tofsee. Tofsee is multi-purpose malware that features a number of modules used to carry out various activities, such as sending spam messages, conducting click fraud, mining cryptocurrency and more. Infected systems become part of the Tofsee spam botnet and are used to send large volumes of spam messages in an effort to infect additional systems and increase the overall size of the botnet under the operator's control. The MD5 hash of this Tofsee sample is e9f4b1d3297a640bb0fb221cb0da1441.
Strike TookPS_8d1e20b5	This strike sends a malware sample known as TookPS. TookPS is a malware downloader. Once infected it begins outbound communication with the attacker C2 server. From here it retrieves commands that allow additional malware to be downloaded to establish a backdoor and allow for remote access. The MD5 hash of this TookPS sample is 8d1e20b5f2d89f62b4fb7f90bc8e29f6.
Strike TrickBot_010c5005	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 010c50055f097fa6bb7d839d3147a2ea.
Strike TrickBot_014be42c	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 014be42cda8eb56cfea80892e736e7c1.
Strike TrickBot_01df6398	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 01df63985a519b2d6447998cceada56b.
Strike TrickBot_04420a52	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 04420a52469fa8c3dece0126fdeb7e80.
Strike TrickBot_0455b17e	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this TrickBot sample is 0455b17ef0b235a3c4dcc9a66e5305e2.
Strike TrickBot_07c5e05b	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 07c5e05b52e1bcc7492266b46982f9e5.

Strike TrickBot_4c44ea21	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 4c44ea21b98a995fb9cb39f485a80fea.
Strike TrickBot_4ce52d89	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary file has one more imports added in the import table. The MD5 hash of this TrickBot sample is 4ce52d89efff02ddd3995af5d69b65f4.

<b>Name</b>	<b>Description</b>
Strike TrickBot_4d9829c8	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 4d9829c8ddc45429fa8f40a758e821bf.
Strike TrickBot_4f25a15b	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 4f25a15bb2f5815f5b7a240cd88813b2.
Strike TrickBot_541f0951	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 541f09510b21a4da53450c48ef0f32f4.
Strike TrickBot_583bb559	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 583bb559817a3e82e9dbc39df68b216a.
Strike TrickBot_5cc6f3d0	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 5cc6f3d095282971693e9a7c1ea3c1d3.
Strike TrickBot_5d3242c3	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 5d3242c30060c66a18c7760adf582841.
Strike TrickBot_5d9d5845	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this TrickBot sample is 5d9d5845db1526c160a1cc0791cf49c.
Strike TrickBot_60da2209	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 60da22098eef105bd2768d317d8b81bc.

<b>Name</b>	<b>Description</b>
Strike TrickBot_629a37a7	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 629a37a7a921ffd9c6a46f42936dd86a.
Strike TrickBot_66d07e5c	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 66d07e5c7d5acb931603325b7e064d47.
Strike TrickBot_6adb52f5	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 6adb52f5787df2e229c6f7efa79b2ab8.
Strike TrickBot_6b553df5	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 6b553df50e52d6a374ca16adb25d2a53.
Strike TrickBot_6bb2cfbd	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 6bb2cfbd10aa288558b3a5d413056ed9.
Strike TrickBot_6c16b771	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 6c16b7715556744d54996256b431668a.
Strike TrickBot_6d0ab756	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 6d0ab7565c6a4094c6ae372747095c09.
Strike TrickBot_6d6da629	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 6d6da6296555ff0bb1b022431a05f6a2.
Strike TrickBot_741a22e5	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 741a22e524f0c165272d7d5881027253.

<b>Name</b>	<b>Description</b>
Strike TrickBot_747e2dff	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 747e2dff11b08670fbdc1632cfb8d394.
Strike TrickBot_74f95a32	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 74f95a32db60decf17b89113ed9e15e7.
Strike TrickBot_76376460	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 763764609377b0f3dbfa81a3cf8d9eff.
Strike TrickBot_7734c98f	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 7734c98fc19d785fb9bb15f160d8edfa.
Strike TrickBot_7c3b350d	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 7c3b350d98f0826e01dcfdf95d123477.
Strike TrickBot_82130c33	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 82130c33ba1635a09ab4d109a3ec6d0a.
Strike TrickBot_84834e1f	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 84834e1fc670e9375f83839273c886df.
Strike TrickBot_86a61b17	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 86a61b172e65df7eb61a576aa284b18f.
Strike TrickBot_87f56ddd	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 87f56ddd321f7c16fc1702e4112e7313.

<b>Name</b>	<b>Description</b>
Strike TrickBot_880c2f22	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is 880c2f2214478fe32bcae2ba00715d77.

Strike TrickBot_e06fb6f6	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is e06fb6f69932083d67ec4702520b7210.
Strike TrickBot_e3af376f	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has the debug flag removed in the PE file format. The MD5 hash of this TrickBot sample is e3af376f2df425e0364f9f40bcfe1124.
Strike TrickBot_e4e07dbc	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is e4e07dbc061bbc8f4069eddf0896a23c.
Strike TrickBot_e6931c55	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is e6931c55d71c6678aa050d969c495576.
Strike TrickBot_ec58d221	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is ec58d22179604219c554c56e5551a33a.
Strike TrickBot_ecb155dc	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is ecb155dc156817dcdd3a9e1708f394ba.

<b>Name</b>	<b>Description</b>
Strike TrickBot_ed20b235	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has random bytes appended at the end of the file. The MD5 hash of this TrickBot sample is ed20b2358d873d1699b1af76d15816f2.
Strike TrickBot_ee5900ed	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is ee5900ed3a23bdfe1e47da24b856d1a6.
Strike TrickBot_f06ecf9c	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is f06ecf9c5dc862cd98a8e2ee6f63b286.
Strike TrickBot_f30cc7a6	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this TrickBot sample is f30cc7a6a5d8290c420c2dedf4eebdf7.
Strike TrickBot_f3591383	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this TrickBot sample is f35913834ff4b11ee7971561136d185.
Strike TrickBot_f59c6952	This strike sends a polymorphic malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The binary has the timestamp field updated in the PE file header. The MD5 hash of this TrickBot sample is f59c695229c7b02cf3440338c53dc20.
Strike TrickBot_f9e5b419	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is f9e5b4192366939cbd96afe2d9cfbd41.
Strike TrickBot_ff63ddb4	This strike sends a malware sample known as TrickBot. Trickbot is a banking trojan targeting sensitive information for select financial institutions. This malware is frequently distributed through malicious spam campaigns. Many of these campaigns rely on downloaders for distribution, such as VB Scripts. The MD5 hash of this TrickBot sample is ff63ddb40ec2e11d7bd734aa4b6f7191.

The MD5 hash of this VenomRAT sample is 96c96ed976df207337f1af1b21ffcfbb.
Strike VenomRAT_9fb172f0	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is 9fb172f0a616bf4786fab3ef452ccc0c.
Strike VenomRAT_a042db80	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is a042db8045036de713193f079fe61d6f.

<b>Name</b>	<b>Description</b>
Strike VenomRAT_a95b7d1e	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is a95b7d1ef3c4f8932fa97c287dd54c70.
Strike VenomRAT_bccaafl1e	This strike sends a polymorphic malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The binary has the timestamp field updated in the PE file header. The MD5 hash of this VenomRAT sample is bccaafl1e70e30b97e86b6c7e45c72a2f.
Strike VenomRAT_c43fffe8	This strike sends a polymorphic malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The binary has the timestamp field updated in the PE file header. The MD5 hash of this VenomRAT sample is c43fffe8372b5d06b2cc13ae7f711726.
Strike VenomRAT_c9a8aba8	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is c9a8aba8bff683df8818cf340e6c882.
Strike VenomRAT_e26ca3f0	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is e26ca3f0e251a42d708b468f79f810a9.
Strike VenomRAT_e34b6864	This strike sends a polymorphic malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this VenomRAT sample is e34b6864f95f5a3a9ed3be1cbd9e3ade.

<b>Name</b>	<b>Description</b>
Strike VenomRAT_e494fc16	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is e494fc161f1189138d1ab2a706b39303.
Strike VenomRAT_f5791878	This strike sends a malware sample known as VenomRAT. VenomRAT is a deceptive malware delivered through a disguised shortcut file named Survey.docx.lnk. The malware poses as a legitimate Word document and deploys deceptive tactics by leveraging a genuine text file. Once executed, VenomRAT engages in keylogging, PC information leaks, and obeys commands from threat actors. The MD5 hash of this VenomRAT sample is f57918785e7cd4f430555e6efb00ff0f.

Some key features of Vultur include its ability to remotely interact with infected devices using Android's Accessibility Services, along with features like app blocking, custom notifications, and evasion of lock screen security measures. The malware employs sophisticated anti-analysis tactics, such as AES encryption and Base64 encoding for C2 communication. 'com.medical.balance' is the package name of the malware sample. The MD5 hash of this malware sample is d80c998228046321e2a19e19968af3c6.
Strike Vultur_faea40b1	This strike sends a polymorphic malware sample known as Vultur. Vultur is an Android banking malware known for its screen recording and remote control functionalities. It spreads through a hybrid attack leveraging SMS and phone calls to trick victims into installing trojanized applications, masquerading as the Brunhilda dropper. Some key features of Vultur include its ability to remotely interact with infected devices using Android's Accessibility Services, along with features like app blocking, custom notifications, and evasion of lock screen security measures. The malware employs sophisticated anti-analysis tactics, such as AES encryption and Base64 encoding for C2 communication. 'com.medical.balance' is the package name of the malware sample. Constant strings in the code has been encrypted. The MD5 hash of this malware sample is faea40b1c43d87beabe2616736e8dd58.
Strike Weaver Ant_3f46a223	This strike sends a malware sample known as Weaver Ant. Weaver Ant is the name of a China-nexus threat group associated with an attack against a major Asian telecommunication company. This attack employed variants of the China Chopper web shell and this sample was detected in the attack. The MD5 hash of this Weaver Ant sample is 3f46a22398fffa3e43caff35034a6bae.
Strike Weaver Ant_49295998	This strike sends a malware sample known as Weaver Ant. Weaver Ant is the name of a China-nexus threat group associated with an attack against a major Asian telecommunication company. This attack employed variants of the China Chopper web shell and this sample was detected in the attack. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Weaver Ant sample is 49295998ca3dbba3179a083d15c5ac3f.
Strike Whiffy Recon_00923097	This strike sends a malware sample known as Whiffy Recon. Whiffy Recon is malware that has been detected being delivered via the Smoke Loader botnet. The malware looks for the WLANSVC service on a system and will exit if it does not exist. This malware scans for wifi access points using the Windows WLAN API, and sends POST requests to Google's Geolocation API. This provides the coordinates to the location of the access points which gets sent recorded and sent back to the attacker C2 server via an authorization UUID. The MD5 hash of this Whiffy Recon sample is 009230972491f5f5079e8e86e19d5458.

Name	Description
Strike Whiffy Recon_649b89c4	This strike sends a polymorphic malware sample known as Whiffy Recon. Whiffy Recon is malware that has been detected being delivered via the Smoke Loader botnet. The malware looks for the WLANSVC service on a system and will exit if it does not exist. This malware scans for wifi access points using the Windows WLAN API, and sends POST requests to Google's Geolocation API. This provides the coordinates to the location of the access points which gets sent recorded and sent back to the attacker C2 server via an authorization UUID. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Whiffy Recon sample is 649b89c4e9e8e7063966ee87350398b9.
Strike Whiffy Recon_801b4814	This strike sends a polymorphic malware sample known as Whiffy Recon. Whiffy Recon is malware that has been detected being delivered via the Smoke Loader botnet. The malware looks for the WLANSVC service on a system and will exit if it does not exist. This malware scans for wifi access points using the Windows WLAN API, and sends POST requests to Google's Geolocation API. This provides the coordinates to the location of the access points which gets sent recorded and sent back to the attacker C2 server via an authorization UUID. The binary has the debug flag removed in the PE file format. The MD5 hash of this Whiffy Recon sample is 801b4814ad8066e447d65fcfd641aa70.
Strike Whiffy Recon_bc2dfa0b	This strike sends a polymorphic malware sample known as Whiffy Recon. Whiffy Recon is malware that has been detected being delivered via the Smoke Loader botnet. The malware looks for the WLANSVC service on a system and will exit if it does not exist. This malware scans for wifi access points using the Windows WLAN API, and sends POST requests to Google's Geolocation API. This provides the coordinates to the location of the access points which gets sent recorded and sent back to the attacker C2 server via an authorization UUID. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Whiffy Recon sample is bc2dfa0b70de83c33e7d586144860f60.
Strike Whiffy Recon_d19b1629	This strike sends a polymorphic malware sample known as Whiffy Recon. Whiffy Recon is malware that has been detected being delivered via the Smoke Loader botnet. The malware looks for the WLANSVC service on a system and will exit if it does not exist. This malware scans for wifi access points using the Windows WLAN API, and sends POST requests to Google's Geolocation API. This provides the coordinates to the location of the access points which gets sent recorded and sent back to the attacker C2 server via an authorization UUID. The binary has been packed using upx packer, with the default options. The MD5 hash of this Whiffy Recon sample is d19b16297b2bd695850a4131cd08bca9.
Strike Whiffy Recon_e33265c3	This strike sends a polymorphic malware sample known as Whiffy Recon. Whiffy Recon is malware that has been detected being delivered via the Smoke Loader botnet. The malware looks for the WLANSVC service on a system and will exit if it does not exist. This malware scans for wifi access points using the Windows WLAN API, and sends POST requests to Google's Geolocation API. This provides the coordinates to the location of the access points which gets sent recorded and sent back to the attacker C2 server via an authorization UUID. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this Whiffy Recon sample is e33265c35509acd382779fca4103bdf2.

<b>Name</b>	<b>Description</b>
Strike WhisperGate DLL Loader_b3370eb3	This strike sends a malware sample known as WhisperGate DLL Loader. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the DLL Loader. The MD5 hash of this WhisperGate DLL Loader sample is b3370eb3c5ef6c536195b3bea0120929.
Strike WhisperGate DLL Loader_e61518ae	This strike sends a malware sample known as WhisperGate DLL Loader. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the DLL Loader. The MD5 hash of this WhisperGate DLL Loader sample is e61518ae9454a563b8f842286bbdb87b.
Strike WhisperGate Downloader_14c8482f	This strike sends a malware sample known as WhisperGate Downloader. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the Downloader. The MD5 hash of this WhisperGate Downloader sample is 14c8482f302b5e81e3fa1b18a509289d.
Strike WhisperGate Downloader_87037d61	This strike sends a polymorphic malware sample known as WhisperGate Downloader. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the Downloader. The binary has the timestamp field updated in the PE file header. The MD5 hash of this WhisperGate Downloader sample is 87037d614242a155e033dcf1a4e23edc.
Strike WhisperGate Downloader_ba93cdc0	This strike sends a polymorphic malware sample known as WhisperGate Downloader. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the Downloader. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this WhisperGate Downloader sample is ba93cdc021c860abd7015f933b4b795e.

<b>Name</b>	<b>Description</b>
Strike WhisperGate Downloader_bfb1c1c2c2	This strike sends a polymorphic malware sample known as WhisperGate Downloader. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the Downloader. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this WhisperGate Downloader sample is bfb1c2c2ed861fb7435533378304574.
Strike WhisperGate MBR Wiper_5d5c99a0	This strike sends a malware sample known as WhisperGate MBR Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the MBR Wiper. The MD5 hash of this WhisperGate MBR Wiper sample is 5d5c99a08a7d927346ca2dafa7973fc1.
Strike WhisperKill Wiper_22bd9ed6	This strike sends a polymorphic malware sample known as WhisperKill Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the final wiper. The binary has been packed using upx packer, with the default options. The MD5 hash of this WhisperKill Wiper sample is 22bd9ed61d794576b42ccc477dc53e00.
Strike WhisperKill Wiper_3907c7fb	This strike sends a malware sample known as WhisperKill Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the final wiper. The MD5 hash of this WhisperKill Wiper sample is 3907c7fdb4148395284d8e6e3c1dba5d.
Strike WhisperKill Wiper_4b0e0fce	This strike sends a polymorphic malware sample known as WhisperKill Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the final wiper. The binary has the checksum removed in the PE file format. The MD5 hash of this WhisperKill Wiper sample is 4b0e0fce7b043861ff2731a83a4b4df0.

<b>Name</b>	<b>Description</b>
Strike WhisperKill Wiper_724ee459	This strike sends a polymorphic malware sample known as WhisperKill Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the final wiper. The binary has random bytes appended at the end of the file. The MD5 hash of this WhisperKill Wiper sample is 724ee45952d709be7c79d7d1f1497ea2.
Strike WhisperKill Wiper_75a007bf	This strike sends a polymorphic malware sample known as WhisperKill Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the final wiper. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this WhisperKill Wiper sample is 75a007bf2b9b25e66bba3b10d3094511.
Strike WhisperKill Wiper_a6615ab8	This strike sends a polymorphic malware sample known as WhisperKill Wiper. In January 2022 the WhisperGate malware was detected in cyber attacks being conducted against the Ukrainian Government. WhisperGate is a multi-stage malware that masquerades as ransomware. It downloads a payload that wipes the MBR, then downloads a malicious file from a Discord server. This last file drops and executes a final wiper payload that enumerates the drives on the system and proceeds to wipe all files with specific extensions. This sample is the final wiper. The binary file has one more imports added in the import table. The MD5 hash of this WhisperKill Wiper sample is a6615ab8fb6f99fd82569cbfa5762a5f.
Strike WinorDLL64_13a44e55	This strike sends a malware sample known as WinorDLL64. The WinorDLL64 malware has recently been attributed to the Lazarus APT group. It is a recently discovered payload of the Wslink Downloader malware. The payload serves as a backdoor that acquires system information, can exfiltrate files and execute additional commands. The MD5 hash of this WinorDLL64 sample is 13a44e5599c225d88d20398b4bec842a.
Strike WyrmSpy_015f01ca	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is 015f01cacca56bb4c8b1978a29194491.

<b>Name</b>	<b>Description</b>
Strike WyrmSpy_0424b9dc	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is 0424b9dca148e291178acae85797b9e3.
Strike WyrmSpy_11c73a0c	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is 11c73a0c0239c1b4c8687f938bb62994.
Strike WyrmSpy_1f139e86	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is 1f139e861e413544b13744b9f28bc197.
Strike WyrmSpy_2750e220	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is 2750e220054bd64faabb10b50a2294bd.
Strike WyrmSpy_38fe6f99	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is 38fe6f997303b30244d41f3939b64448.

The MD5 hash of this WyrmSpy sample is cba226f05eae72c7c8680f6ee47fd66c.
Strike WyrmSpy_cc14fa95	This strike sends a malware sample known as WyrmSpy. WyrmSpy is an Android surveillanceware that has been attributed to the APT41 group. This malware has data collection and exfiltration capabilities. The app masquerades as a default Android OS system app used to display notifications to the user. It has also been detected posing as adult video content, a food delivery platform, and Adobe Flash. Once the app is installed it downloads additional modules to give it further capabilities. These capabilities include escalating privileges, communicating with C2 servers to upload log files, photos, and conduct surveillance on the device to allow for exfiltration of additional data like SMS text and audio. The MD5 hash of this WyrmSpy sample is cc14fa959b6409e9ac566fb4e6ed92d7.

<b>Name</b>	<b>Description</b>

The MD5 hash of this XZ Backdoor sample is cfb1afdfcfeca02f7677b1b401bc536e.
Strike XZ Backdoor_d26cefd9	This strike sends a malware sample known as XZ Backdoor. XZ is a Linux backdoor malware, that is found bundled in the open source compression library XZ Utils. The backdoor leverages a vulnerability, CVE-2024-3094, which utilizes a predefined encrypted private key to run commands on the victim machine as root, if the vulnerable XZ Utils library is installed on the target. The MD5 hash of this XZ Backdoor sample is d26cefd934b33b174a795760fc79e6b5.
Strike XZ Backdoor_d302c6cb	This strike sends a malware sample known as XZ Backdoor. XZ is a Linux backdoor malware, that is found bundled in the open source compression library XZ Utils. The backdoor leverages a vulnerability, CVE-2024-3094, which utilizes a predefined encrypted private key to run commands on the victim machine as root, if the vulnerable XZ Utils library is installed on the target. The MD5 hash of this XZ Backdoor sample is d302c6cb2fa1c03c710fa5285651530f.
Strike XZ Backdoor_d32d7710	This strike sends a malware sample known as XZ Backdoor. XZ is a Linux backdoor malware, that is found bundled in the open source compression library XZ Utils. The backdoor leverages a vulnerability, CVE-2024-3094, which utilizes a predefined encrypted private key to run commands on the victim machine as root, if the vulnerable XZ Utils library is installed on the target. The MD5 hash of this XZ Backdoor sample is d32d7710ddca687c5d3ead014a395fd9.
Strike XZ Backdoor_edfb3661	This strike sends a malware sample known as XZ Backdoor. XZ is a Linux backdoor malware, that is found bundled in the open source compression library XZ Utils. The backdoor leverages a vulnerability, CVE-2024-3094, which utilizes a predefined encrypted private key to run commands on the victim machine as root, if the vulnerable XZ Utils library is installed on the target. The MD5 hash of this XZ Backdoor sample is edfb3661736e46ab3954bebbf7dc4b5c.
Strike XZ Backdoor_f7ad4e3d	This strike sends a malware sample known as XZ Backdoor. XZ is a Linux backdoor malware, that is found bundled in the open source compression library XZ Utils. The backdoor leverages a vulnerability, CVE-2024-3094, which utilizes a predefined encrypted private key to run commands on the victim machine as root, if the vulnerable XZ Utils library is installed on the target. The MD5 hash of this XZ Backdoor sample is f7ad4e3d4fd38b84736ac4a365a5db41.
Strike Xamalicious_0ffda3a3	This strike sends a polymorphic malware sample known as Xamalicious. Xamalicious is a sophisticated android backdoor implemented using the Xamarin framework. It employs social engineering to gain accessibility privileges and communicates with a command-and-control server. The second-stage payload, injected dynamically as an assembly DLL, takes full control of the device, potentially engaging in fraudulent activities like ad-clicking and unauthorized financially motivated app installations. 'hello.uwer.hello.hello.google.is.the.best' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 0ffda3a31c5f1ff988a9db7d3195d718.

<b>Name</b>	<b>Description</b>
Strike Xamalicious_41812341	<p>This strike sends a polymorphic malware sample known as Xamalicious. Xamalicious is a sophisticated android backdoor implemented using the Xamarin framework. <b>Name</b>	<b>Description</b>
Strike XtremeRAT_a0ec57b9	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a0ec57b95063a067e73958fddd6d834f.
Strike XtremeRAT_a1885beb	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a1885bebb7c88ac9a4bab04e91c848a5.
Strike XtremeRAT_a1a7174a	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a1a7174a804d14fc7a8546dae894cd06.
Strike XtremeRAT_a344bf73	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a344bf734cde979206eeb19372a4acf7.
Strike XtremeRAT_a39ace5e	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a39ace5e1c16e0ffedbb28e4356606e5.
Strike XtremeRAT_a412baf4	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a412baf4f612a58b489a66ea9ce819e0.
Strike XtremeRAT_a4ae4668	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a4ae4668bf4a6b00ce599e24c3d4a9a1.
Strike XtremeRAT_a5b7bad5	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a5b7bad5f42cf20734060fc7172a68.
Strike XtremeRAT_a67a00f3	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a67a00f31fa63a762876a35e26548ae0.
Strike XtremeRAT_a6da1059	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a6da105983786fdcdfbeba004443cb77.
Strike XtremeRAT_a7830f1b	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a7830f1bfdd4bd60e377f899512117dc.
Strike XtremeRAT_a8502dfa	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a8502dfaaf19b633bdf35b0058c95ad.

<b>Name</b>	<b>Description</b>
Strike XtremeRAT_a9aae2d6	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a9aae2d62eb70e5d510072c64eae1d94.
Strike XtremeRAT_a9ec3559	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is a9ec355939ec0234cf7fe1125eae2f7.
Strike XtremeRAT_aa0da4a7	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is aa0da4a762f19d783b2d04392ea23dcf.
Strike XtremeRAT_aa47c1d4	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is aa47c1d468f84c150555a095d08edc88.
Strike XtremeRAT_ab115bd7	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is ab115bd7a7ca4c70c3acbba81ed682e.
Strike XtremeRAT_acf2acc7	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this XtremeRAT sample is acf2acc75f98bd9401c0e31dd438f4f5.
Strike XtremeRAT_ad7baa02	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is ad7baa026ee12f9ca6f0c0f969e9a75c.
Strike XtremeRAT_ae48c84f	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this XtremeRAT sample is ae48c84f07c30348b34aa3c8282589ea.
Strike XtremeRAT_ae5376c6	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is ae5376c64b035c200d4817eb5d01824f.
Strike XtremeRAT_aecd2075	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is aecd2075262f2e69c38eb9c4fc933c80.
Strike XtremeRAT_b5a35b18	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has random bytes appended at the end of the file. The MD5 hash of this XtremeRAT sample is b5a35b1816b34744d602aa0e624a01ac.

<b>Name</b>	<b>Description</b>
Strike XtremeRAT_b6d2a291	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has the timestamp field updated in the PE file header. The MD5 hash of this XtremeRAT sample is b6d2a291d159fc759ffa3631e2f273bf.
Strike XtremeRAT_b7eea26e	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is b7eea26e19f3c867b3e99b1f32be28be.
Strike XtremeRAT_bdbc9286	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is bdbc92863d0b4be83d64cd2003489cc3.
Strike XtremeRAT_bf2b1eb0	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is bf2b1eb048273d25c17913e4990bb4c5.
Strike XtremeRAT_c588e91e	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is c588e91e298577e17cbd22849cb469cf.
Strike XtremeRAT_c7ebcd0d	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has random bytes appended at the end of the file. The MD5 hash of this XtremeRAT sample is c7ebcd0d8c135620ed01f0d5e57deac8.
Strike XtremeRAT_c89afadf	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has random contents appended in one of the existing sections in the PE file format. The MD5 hash of this XtremeRAT sample is c89afadf76e64097f39455adca932039.
Strike XtremeRAT_cb02045b	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has been packed using upx packer, with the default options. The MD5 hash of this XtremeRAT sample is cb02045b65dd9463c7f06221b77ce1b0.
Strike XtremeRAT_cc0eff29	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is cc0eff29cf999229cb36fb04e9ea5313.
Strike XtremeRAT_cda4d528	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is cda4d52802587e20f29b10ceb14be889.

<b>Name</b>	<b>Description</b>
Strike XtremeRAT_cea8d367	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is cea8d367b150e2afdd38787f15978483.
Strike XtremeRAT_d151b530	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has the checksum removed in the PE file format. The MD5 hash of this XtremeRAT sample is d151b530a789e400bbc89c995cc9103e.
Strike XtremeRAT_d6a934bb	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is d6a934bbc082304cd87bf5091e7829c5.
Strike XtremeRAT_dae76d12	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is dae76d125cf0fbc22ff62143af1c859c.
Strike XtremeRAT_dc6ff189	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this XtremeRAT sample is dc6ff189e58cc7cee002946e3cc635bb.
Strike XtremeRAT_de66d12d	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is de66d12d576a1df764e09f4f51ba1388.
Strike XtremeRAT_e055f8fc	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is e055f8fc8140e42796b541e6e409c71d.
Strike XtremeRAT_e05bc247	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is e05bc247b86c6a2d73bf2519644f41b3.
Strike XtremeRAT_e85a2985	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is e85a2985ba0e39773f1c1a18fe1cab0a.
Strike XtremeRAT_eb27e402	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is eb27e4021af35e509f349581821c0ca4.
Strike XtremeRAT_efc6e7e0	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is efc6e7e02569fc9ac553b6bf19899eeef.

<b>Name</b>	<b>Description</b>
Strike XtremeRAT_ed098eba	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this XtremeRAT sample is ed098eba90e352468dc491acca89ac44.
Strike XtremeRAT_f1cc2d7f	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is f1cc2d7fd58ec1e309bfa09ec55d2fec.
Strike XtremeRAT_f2650149	This strike sends a polymorphic malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this XtremeRAT sample is f2650149885c0116fd8ff232037fdb2f.
Strike XtremeRAT_f2be7da2	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is f2be7da21606a104612fb61f759caa73.
Strike XtremeRAT_f90e0c79	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is f90e0c7971b848a0191aee9f78652f6b.
Strike XtremeRAT_ff40e16f	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is ff40e16f172f69f3ada6b94efd815666.
Strike XtremeRAT_ffa5a03a	This strike sends a malware sample known as XtremeRAT. XtremeRAT is a remote access trojan that allows the attacker to eavesdrop on users and modify the running system. The MD5 hash of this XtremeRAT sample is ffa5a03a9922f642827a9321301848c5.
Strike Zanubis_323d97c8	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 323d97c876f173628442ff4d1aaa8c98.
Strike Zanubis_45d07497	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 45d07497ac7fe550b8b394978652caa9.
Strike Zanubis_5c11e88d	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 5c11e88d1b68a84675af001fd4360068.

<b>Name</b>	<b>Description</b>
Strike Zanubis_660d4eeb	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 660d4eeb022ee1de93b157e2aa8fe1dc.
Strike Zanubis_6b0d14fb	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 6b0d14fb1ddd04ac26fb201651eb5070.
Strike Zanubis_7ae448b0	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 7ae448b067d652f800b0e36b1edea69f.
Strike Zanubis_81f91f20	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 81f91f201d861e4da765bae8e708c0d0.
Strike Zanubis_8820ab36	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 8820ab362b7bae6610363d6657c9f788.
Strike Zanubis_8949f492	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 8949f492001bb0ca9212f85953a6dcda.
Strike Zanubis_90221365	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is 90221365f08640ddcab86a9cd38173ce.
Strike Zanubis_b3f0223e	This strike sends a malware sample known as Zanubis. Zanubis is an Android banking malware that has evolved over the last few years. It employs various obfuscation techniques as well as deceptive tricks to obtain necessary permissions to run. The malware steals data, and sends credentials to a remote C2 server. The MD5 hash of this Zanubis sample is b3f0223e99b7b66a71c2e9b3a0574b12.

<b>Name</b>	<b>Description</b>
Strike Zardoor_07c47f9b	This strike sends a malware sample known as Zardoor. Zardoor is a sophisticated backdoor discovered in a stealthy espionage campaign targeting organizations in the Middle East. This campaign employs custom backdoors and modified reverse proxy tools to establish command and control (C2) and maintain long-term access within victim networks. The threat actor utilizes living-off-the-land binaries (LoLBins) and customized tools to evade detection and execute remote commands. The backdoor transmits encrypted data to attacker's C2, executes fileless PE payloads and updates C2 configuration dynamically. The MD5 hash of this Zardoor sample is 07c47f9b80c3861f219078902b860077.
Strike Zardoor_23f6b621	This strike sends a malware sample known as Zardoor. Zardoor is a sophisticated backdoor discovered in a stealthy espionage campaign targeting organizations in the Middle East. This campaign employs custom backdoors and modified reverse proxy tools to establish command and control (C2) and maintain long-term access within victim networks. The threat actor utilizes living-off-the-land binaries (LoLBins) and customized tools to evade detection and execute remote commands. The backdoor transmits encrypted data to attacker's C2, executes fileless PE payloads and updates C2 configuration dynamically. The MD5 hash of this Zardoor sample is 23f6b621c70024749217614680a2d2b2.
Strike Zardoor_27e96e13	This strike sends a malware sample known as Zardoor. Zardoor is a sophisticated backdoor discovered in a stealthy espionage campaign targeting organizations in the Middle East. This campaign employs custom backdoors and modified reverse proxy tools to establish command and control (C2) and maintain long-term access within victim networks. The threat actor utilizes living-off-the-land binaries (LoLBins) and customized tools to evade detection and execute remote commands. The backdoor transmits encrypted data to attacker's C2, executes fileless PE payloads and updates C2 configuration dynamically. The MD5 hash of this Zardoor sample is 27e96e13a0a538aad23540d52977012f.
Strike Zardoor_3a326ef3	This strike sends a malware sample known as Zardoor. Zardoor is a sophisticated backdoor discovered in a stealthy espionage campaign targeting organizations in the Middle East. This campaign employs custom backdoors and modified reverse proxy tools to establish command and control (C2) and maintain long-term access within victim networks. The threat actor utilizes living-off-the-land binaries (LoLBins) and customized tools to evade detection and execute remote commands. The backdoor transmits encrypted data to attacker's C2, executes fileless PE payloads and updates C2 configuration dynamically. The MD5 hash of this Zardoor sample is 3a326ef320df0d7f111f3a0b27caf238.
Strike Zardoor_72b0ca26	This strike sends a malware sample known as Zardoor. Zardoor is a sophisticated backdoor discovered in a stealthy espionage campaign targeting organizations in the Middle East. This campaign employs custom backdoors and modified reverse proxy tools to establish command and control (C2) and maintain long-term access within victim networks. The threat actor utilizes living-off-the-land binaries (LoLBins) and customized tools to evade detection and execute remote commands. The backdoor transmits encrypted data to attacker's C2, executes fileless PE payloads and updates C2 configuration dynamically. The MD5 hash of this Zardoor sample is 72b0ca267df69ce8c86440a81cd2f321.

<b>Name</b>	<b>Description</b>
Strike Zardoor_82fce2c2	This strike sends a malware sample known as Zardoor. Zardoor is a sophisticated backdoor discovered in a stealthy espionage campaign targeting organizations in the Middle East. This campaign employs custom backdoors and modified reverse proxy tools to establish command and control (C2) and maintain long-term access within victim networks. The threat actor utilizes living-off-the-land binaries (LoLBins) and customized tools to evade detection and execute remote commands. Strike Zbot_fe2e0db4	This strike sends a malware sample known as Zbot. Zbot also known as Zeus is a trojan often associated with stealing banking information by keystroke logging and form grabbing techniques. The MD5 hash of this Zbot sample is fe2e0db42c21c90dcdbbe0983ab89276.
Strike Zbot_fe56fc37	This strike sends a malware sample known as Zbot. Zbot also known as Zeus is a trojan often associated with stealing banking information by keystroke logging and form grabbing techniques. The MD5 hash of this Zbot sample is fe56fc379bd393a225923b588e3ce27b.
Strike Zegost_02293aea	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 02293aead10c7195514fbbaa749ee2dd.
Strike Zegost_0408ff2a	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 0408ff2a2f67c7492a269a9a7d71b980.
Strike Zegost_06e1716a	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 06e1716af034046c88874d7d338afbe9.
Strike Zegost_09e295bd	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 09e295bd6b7c1d6714e107f28e5414f5.
Strike Zegost_0a9281d4	This strike sends a polymorphic malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The binary has a random section name renamed according to the PE format specification. The MD5 hash of this Zegost sample is 0a9281d4c468831b6b946d43d2ebf16f.
Strike Zegost_10d7b4f7	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 10d7b4f78c61a60f124b65233b2dd6c2.
Strike Zegost_114a0086	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The MD5 hash of this Zegost sample is 114a00861438a53af3626629f072c496.

<b>Name</b>	<b>Description</b>
Strike Zegost_1c449492	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The MD5 hash of this Zegost sample is 1c4494926a2b2555a13753a528bca733.
Strike Zegost_1cf31a4e	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 1cf31a4eed8b843df39342fb99984f24.
Strike Zegost_1d15f5f9	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 1d15f5f9360c8f1e3f1f871401f6599f.
Strike Zegost_1e5b1708	This strike sends a polymorphic malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The binary has random strings (lorem ipsum) appended at the end of the file. The MD5 hash of this Zegost sample is 1e5b1708147129aba1f46ffeae389376.
Strike Zegost_21be8e77	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 21be8e778089b7bcd8b9ab9b26197a6.
Strike Zegost_2609f845	This strike sends a polymorphic malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The binary has the timestamp field updated in the PE file header. The MD5 hash of this Zegost sample is 2609f845507a4ae9a9d2a32016498630.
Strike Zegost_28ae85d8	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 28ae85d88fed2184bba78d1af16827da.
Strike Zegost_2a361689	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 2a361689bd76bb804dc4f9b2088c152f.
Strike Zegost_2e7bc9b2	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 2e7bc9b2ca377b14f5cb26fc719792db.

<b>Name</b>	<b>Description</b>
Strike Zegost_3ec0f08b	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 3ec0f08b9a5e8cd350d60ea98b66bc6b.
Strike Zegost_41c3eb41	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 41c3eb4117d78836fa43acbb3fd1a362.
Strike Zegost_461c6d64	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 461c6d648ad38eaf49feb08a5f7a34d8.
Strike Zegost_46762216	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The MD5 hash of this Zegost sample is 4676221611d727a8b2c54f6e78da92ee.
Strike Zegost_4b186588	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The MD5 hash of this Zegost sample is 4b186588668a181de87fd5520bf57219.
Strike Zegost_582433da	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The MD5 hash of this Zegost sample is 582433da271d3f4c78027bbebba4e4c.
Strike Zegost_5bbc6e17	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 5bbc6e178e98a48301ba1c78671c89e5.
Strike Zegost_5bde8a69	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, uses man-in-the-middle attacks to steal banking information. When executed, it injects itself into legitimate Windows processes such as "explorer.exe" and "winver.exe". When the user accesses a banking website, it displays a form to trick the user into submitting personal information. The MD5 hash of this Zegost sample is 5bde8a697c4ed4b020035278f48ebbca.
Strike Zegost_5c6ef7c4	This strike sends a malware sample known as Zegost. Zegost, also known as Zusy, steals banking information. It displays a form to trick the user into submitting personal information when visiting a banking website. The MD5 hash of this Zegost sample is 5c6ef7c40c341feec5ef105b2bea417c.

The MD5 hash of this malware sample is ddbf3a1d8c4e0b097190cdd118275a4f.
Strike caprарат_021d8f6a	This strike sends a polymorphic malware sample known as CapraRAT. CapraRat is a spyware used by the group Transparent Tribe (APT 36). It disguises itself as video browsing apps targeting mobile gamers, weapons enthusiasts, and TikTok fans. CapraRat requests extensive permissions, such as GPS access, network state management, and SMS capabilities. Compared to previous campaigns, it focuses on surveillance rather than backdoor functionalities. The malware employs social engineering by mimicking legitimate apps like YouTube, embedding spyware into apps with preloaded queries related to popular themes, making it a persistent threat. 'com.maeps.crygms.tktols' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 021d8f6a4cc719f7137d78aaf459490f.

This campaign used CVE-2017-11882, a vulnerability in Microsoft Office, to deliver QuasarRAT and dcRAT to Windows and AndroidRAT to mobile devices. This sample is dcRAT. The binary has a new section added in the PE file format with random contents. The MD5 hash of this dcRAT sample is f3c91609bffe4ac5814a5bf0324467bd.
Strike donot_13f3862b	This strike sends a polymorphic malware sample associated with the DoNot APT group. The group utilizes an open-source project from GitHub, augmenting it with malicious code for weaponization. This malware introduces enhanced functionalities, including the ability to record VoIP calls from messaging applications, capturing clipboard contents, downloading payloads dynamically, collecting browser history, and gathering other forms of Personally Identifiable Information (PII) data and ShareMe activity. The malware employs the Firebase Cloud Messaging (FCM) server as its initial Command and Control (C2) server, managing various functions, including obtaining new C2 server URLs, configuring databases, uninstalling the application, sending text messages, adding contacts, logging calls, and downloading APK files. 'com.syster.serviceapp' is the package name of the malware sample. Constant strings in the code of the malware have been encrypted. The MD5 hash of this malware sample is 13f3862bce2b20b7e2a8aa39b18eab3d.
Strike donot_14302b21	This strike sends a polymorphic malware sample associated with the DoNot APT group. The group utilizes an open-source project from GitHub, augmenting it with malicious code for weaponization. This malware introduces enhanced functionalities, including the ability to record VoIP calls from messaging applications, capturing clipboard contents, downloading payloads dynamically, collecting browser history, and gathering other forms of Personally Identifiable Information (PII) data and ShareMe activity. The malware employs the Firebase Cloud Messaging (FCM) server as its initial Command and Control (C2) server, managing various functions, including obtaining new C2 server URLs, configuring databases, uninstalling the application, sending text messages, adding contacts, logging calls, and downloading APK files. 'com.syster.serviceapp' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 14302b218060aac3e9ee23d09feffb.

<b>Name</b>	<b>Description</b>
Strike hiddenad_2199cc1d	This strike sends a polymorphic malware sample known as HiddenAd. HiddenAd is a type of adware that aggressively displays unwanted advertisements to Android users, generating revenue for its creators. This malware disguises itself as benign Android applications to hide its true purpose. It hides its application icon, encrypts its critical payloads in an SQLCipher database, and employs obfuscation techniques to evade detection. Its primary goal is to bombard users with ads and potentially lead to other security threats on Android devices. 'mapa.com' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 2199cc1db5c9fb1865f1df188977a08a.
Strike hiddenad_baa63680	This strike sends a malware sample known as HiddenAd. HiddenAd is a type of adware that aggressively displays unwanted advertisements to Android users, generating revenue for its creators. This malware disguises itself as benign Android applications to hide its true purpose. It hides its application icon, encrypts its critical payloads in an SQLCipher database, and employs obfuscation techniques to evade detection. Its primary goal is to bombard users with ads and potentially lead to other security threats on Android devices. 'mapa.com' is the package name of the malware sample. Strike kill-floor_40439f39	This strike sends a malware sample known as kill-floor. kill-floor malware is a kernel level rootkit malware that has been detected in the wild taking advantage of a legitimate anti-rootkit driver in order to bypass native security mechanisms in order to infect the system. This Bring Your Own Vulnerable Driver malware drops a legitimate Avast Anti-Rootkit driver to gain kernel-level access to the system and terminate security processes. Once the driver is installed it creates a service that begins logging running processes on the system. It uses this information to compare against known software and begins terminating the software that it matches. The MD5 hash of this kill-floor sample is 40439f39f0195c9c7a3b519554afd17a.
Strike llm_enabled_1854a442	This strike sends a malware sample known as llm_enabled. LLM-enabled malware is a type of malware that uses Living-off-the-Land (LotL) binaries and scripts to infiltrate and compromise systems. It is delivered through malicious documents, often embedded with macros, that prompt users to enable editing or content. Once executed, the malware uses embedded scripts to download and execute additional payloads from a remote server. Its key capabilities include evading detection by using legitimate system tools, establishing persistence, and downloading and executing additional malicious payloads. The MD5 hash of this llm_enabled sample is 1854a4427eef0f74d16ad555617775ff.

<b>Name</b>	<b>Description</b>
Strike llm_enabled_1952345e	This strike sends a malware sample known as <code>llm_enabled</code> . The MD5 hash of this <code>llm_enabled</code> sample is <code>74eb831b26a21d954261658c72145128</code> .
Strike llm_enabled_806f5520	This strike sends a malware sample known as <code>llm_enabled</code> . LLM-enabled malware is a type of malware that uses Living-off-the-Land (LotL) binaries and scripts to infiltrate and compromise systems. It is delivered through malicious documents, often embedded with macros, that prompt users to enable editing or content. Once executed, the malware uses embedded scripts to download and execute additional payloads from a remote server. Its key capabilities include evading detection by using legitimate system tools, establishing persistence, and downloading and executing additional malicious payloads. The MD5 hash of this <code>llm_enabled</code> sample is <code>806f552041f211a35e434112a0165568</code> .
Strike llm_enabled_81cd2031	This strike sends a malware sample known as <code>llm_enabled</code> . LLM-enabled malware is a type of malware that uses Living-off-the-Land (LotL) binaries and scripts to infiltrate and compromise systems. It is delivered through malicious documents, often embedded with macros, that prompt users to enable editing or content. Strike mandrake_01897090	This strike sends a polymorphic malware sample known as Mandrake. Mandrake is a sophisticated malware that operates in multiple stages, starting with a dropper that downloads the payload from a command-and-control (C2) server. It collects detailed device information, including installed apps and external IP, and requests permissions to run in the background. In its final stage, Mandrake steals user credentials by loading URLs, initiating remote screen-sharing sessions, and recording the device's screen. It bypasses Android 13 security features using a session-based installer, demonstrating its evolving nature to evade detection and infiltrate official app marketplaces. 'com.cryptopulsing.browser' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 01897090a54d790c8626e4fa4c8bb9e1.
Strike mandrake_03fec806	This strike sends a polymorphic malware sample known as Mandrake. Strike operation_rewrite_0721efb9	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 0721efb9a3e364a372bbb4b7b7c42193.
Strike operation_rewrite_5ed7d3f4	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 5ed7d3f4e83c9456363c0502a7b00fac.

<b>Name</b>	<b>Description</b>
Strike operation_rewrite_6049f6d2	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 6049f6d24d84b335ae8eb19d049e9e42.
Strike operation_rewrite_6cada79f	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 6cada79fd399172f4ff55774ad1954ce.
Strike operation_rewrite_728605f7	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. When a user visits these websites, they are redirected to malicious sites that either host phishing pages or exploit kits. The key capabilities of this malware campaign include website redirection, SEO manipulation, and the potential to deliver further malware through exploit kits or phishing attacks. The MD5 hash of this operation_rewrite sample is 728605f7586642a814e900e9b2f236fb.
Strike operation_rewrite_74863e3 5	This strike sends a malware sample known as operation_rewrite. Operation Rewrite is a malware campaign that involves SEO poisoning and redirection to malicious websites. The threat actors use blackhat SEO techniques, including the creation of spam pages and the manipulation of search engine algorithms, to drive traffic to their websites. <b>Name</b>	<b>Description</b>
Strike rafelrat_16c6c99d	<p>This strike sends a polymorphic malware sample known as Rafel RAT. Rafel RAT is a sophisticated Android malware that has evolved from espionage to ransomware operations. It is transmitted through phishing campaigns, malicious apps, or compromised websites. The malware can gain unauthorized access to devices. Once installed, it can perform extensive data exfiltration, including capturing keystrokes, recording audio, accessing files, and stealing credentials. The malware's ransomware capabilities can encrypt files on the infected device, demanding a ransom for their release. It also features Command and Control (C2) capabilities, allowing attackers to remotely manage infected devices and execute commands. 'com.velociraptor.raptor' is the package name of the malware sample. Constant strings in the code have been encrypted. The MD5 hash of this malware sample is 16c6c99d545d53957fbfe342f8f51903.</p>

Strike spyloan_33758feb	This strike sends a polymorphic malware sample known as SpyLoan. SpyLoan masquerades as a legitimate financial loan app, distributed through social engineering tactics. The malware targets users by exploiting their trust and urgency, often through fake loan offers. The malware collects extensive personal information, including contact lists, SMS data, and call logs, which are then used to harass and extort victims. It also communicates with command-and-control (C2) servers to exfiltrate stolen data. 'com.prestamoseguro.ss' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 33758feba989a613a43d0dcefc605d41.
Strike spyloan_402ea7dd	This strike sends a polymorphic malware sample known as SpyLoan. SpyLoan masquerades as a legitimate financial loan app, distributed through social engineering tactics. The malware targets users by exploiting their trust and urgency, often through fake loan offers. The malware collects extensive personal information, including contact lists, SMS data, and call logs, which are then used to harass and extort victims. It also communicates with command-and-control (C2) servers to exfiltrate stolen data. 'com.gotoloan.cash' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 402ea7dd87ce9f16aeff53a60384b98e.

Name	Description
Strike vahan_0837b316	This strike sends a polymorphic malware sample known as SpyMax. The malware masquerades as an application from the humanitarian organization CARE International to deceive users. The application requests excessive and invasive permissions, including access to the phone's camera, audio, SMS, contacts, internet, WiFi, and external storage (read and write permissions). Such extensive permission requests are indicative of the malware's intent to compromise user privacy and security, potentially allowing it to monitor and control various aspects of the device without the user's consent. 'com.orgnimilicareat.il0' is the package name of the malware sample. The manifest file of the malware has been randomly rearranged. The MD5 hash of this malware sample is 0837b316ab674596618dae9d7357f312.
Strike vahan_33b61328	This strike sends a polymorphic malware sample known as VAHAN PARIVAHAN. The phishing campaign targets Android users in India and is designed to deceive individuals into providing personal and financial information through fake messages and websites mimicking the Regional Transport Office (RTO). The malware is distributed via WhatsApp, prompting users to click on malicious links. It collects device and contact data, sends this information to a Telegram bot, and uses Firebase to obtain phone numbers and text messages, facilitating unauthorized SMS verification. The campaign uses a Command and Control (C2) server and operates as a Malware-as-a-Service (MaaS). 'eruyy.yrry' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is 33b613285e305a6a8ae5fea7a495ec82.

<b>Name</b>	<b>Description</b>
Strike wroba_abe91fc8	<p>This strike sends a polymorphic malware sample known as Wroba.o/XLoader. It is an android malware that has been recently updated to include a DNS changer module. This allows the malware to hijack routers and redirect devices that connect to the router to malicious websites. The malware is typically distributed through phishing campaigns, where users are tricked into clicking on a link or downloading an attachment that contains the malware. Once installed on a device, Wroba.o/XLoader can steal personal data, install other malware, and even take control of the device. The addition of a DNS changer module makes Wroba.o/XLoader even more dangerous, as it can now spread to other devices on the same network. This means that if one device on a network is infected with this malware then, all other devices on the network are also at risk. 'yy.wtkvds.lhmrgg.cim' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this malware sample is abe91fc864fd6b7975cd2ed365923a3c.</p>

It then carries out surveillance tasks based on instructions it receives from its command and control (C2) servers. These instructions encompass actions such as directing the malware to transfer log files, retrieve photos from the device, and gather device location information through the utilization of the Baidu Location library. The malware infiltrates systems under the guise of innocuous-looking applications.</p> <p>'com.sec.android.provider.badge' is the package name of the malware sample. The malware has been rebuilt without any modifications. The MD5 hash of this wyrmspy sample is fe7ab00c4d7f0c2b343e61473ff24cee.</p>
Strike xCry_7475713d	<p>This strike sends a malware sample known as xCry. xCry is a ransomware that is written in Nim and can easily be adapted to work across multiple platforms. The MD5 hash of this xCry sample is 7475713df82b2a81b2d32715a94c2b63.</p>
Strike zanubis_054061a4	<p>This strike sends a malware sample known as Zanubis. Zanubis is an Android banking Trojan that disguises itself as trusted apps, like the Peruvian government's SUNAT app, to target financial and cryptocurrency users in Peru. It gains control by tricking users into granting Accessibility permissions and uses obfuscation techniques for evasion. Once inside a device, it appears legitimate by loading genuine websites. Zanubis maintains connectivity to a controlling server and can adapt to steal data from specific apps while potentially gaining full control of the device. It can also disable a device by posing as an Android system update, rendering it unusable. 'at.au.av' is the package name of the malware sample. The MD5 hash of this malware sample is 054061a4f0c37b0b353580f644eac554.</p>

<b>Name</b>	<b>Description</b>
Strike zanubis_248b2b76	This strike sends a malware sample known as Zanubis.
